DP Professionals

Revolutionizing an industry

Sea-Land Corporation was the first transportation company to understand the potential of a standardized container that could travel from sea-to road-to rail. In less than 3 decades, we have driven this idea to a $1.8 billion success worldwide and revolutionized the shipping business. And we won't stop there - we're at work pioneering the optimum utilization of information systems.

We have openings at all levels for creative professionals as well as CICS Programmer Analysts with a minimum of 1 year's experience who have the kind of vision it takes to see a different future.

MVS/XA
We require a minimum of 1 year's experience; solid installation knowledge using SMP4 or SMPE; strong MVS internals, VTAM or TCAM experience a plus.

CICS
We require a minimum of 1 year's experience; CICS tables & definitions and internals which will call on your knowledge of either MVS/XA, TCAM, VTAM or CICS.

Network Communications
A minimum of 1 year's experience with TCAM or VTAM/NCP, including and maintaining SNA program products and good networking ability are necessary.

Disaster Recovery Analyst
A minimum of 2 year's experience in DASD management and systems support. Strong JCL skills and a knowledge of SAS using DMS/OS and FDR or DFDSS are essential.

The salaries are attractive and the benefits complete. Our location is convenient to major highways and less than ½ hour from the heart of NYC and minutes away from Newark Airport.

Send resume, with salary history, to: Manager, Personnel Department CW, PO Box 1050, Elizabeth, NJ 07207 or call for immediate consideration:

EXPERIENCED SYSTEMS PROGRAMMERS, ANALYSTS AND PROGRAMMER ANALYSTS FOR SUNBELT LOCATIONS

Job dissatisfaction, complacency, and frustration are the biggest obstacles to overcome to achieve one's career goals. Everyday new career opportunities pass us by because we are unaware of their existence. Let us keep you abreast of what your true value is in the market place. Absolutely no obligations, please call or write Keith Reichle, CPC, Data Processing Specialist.

LEASING REMARKETING EXECUTIVE

Major East Coast Leasing Company seeks experienced executive to remarket data processing equipment. Equipment is chiefly IBM but includes some others. Top compensation depending upon experience with added substantial performance bonus.

We are looking for a knowledgeable go-getter who seeks a challenging position with high earnings potential. Past experience could include a marketing/remarketing position in a leasing company, or work as a computer broker or as head of a large data processing department but the most important characteristic of the successful candidate will be an entrepreneurial drive.

Reply by letter or resume or if qualified, call 800-386-0005.

MIS Professional Opportunities
IBM Environment

As the management support unit to a 5[illegible]-bed tertiary care medical center and other health care affiliates, GEISINGER System Services provides data processing professionals state-of-the-art challenges and advancement in a Central DP System for multi-entity users. The present environment is an on-line IBM dual CPU utilizing MVS, VM, DL-1, CICS, TSO/ISPF, VTAM, NCP and more. We have career opportunities for:

Senior Systems Analyst

B.S. in Computer Science, Information Science, Health Care related speciality or equivalent experience. Must have a minimum of six (6) years experience in systems design or detailed application experience as well as experience with MVS-JCL, CICS, and COBOL. Must have two (2) years experience as a systems analyst working with financial systems. Good analytical skills, ability to recognize problems and formulate solutions required. Experience with all phases of system development required. Position involves extensive user contact.

Analyst/Programmer

Involves extensive user contact. Requires a B.S. in Information Science, Business Administration or related field or equivalent experience with at least three (3) years programming/analysis experience. Experience in COBOL and CICS required. MSA Financial Systems and MVS-JCL experience preferred.

Systems Security Administrator

Ground floor opportunity to establish and maintain a security environment in a multi-user system. B.S. in Computer Science or related discipline and at least six (6) years experience in a large scale IBM environment. Thorough knowledge of TSO, CICS, and/or MVS-JCL required. Experience in one of the following is also required: applications programming, systems programming or teleprocessing.

All applicants must demonstrate ability to work independently and have excellent interpersonal and communications skills.

We offer an excellent compensation package and a full range of benefits. For consideration, send your resume including salary history and requirements to: Human Resources Department, 30-12/V, GEISINGER, SYSTEM SERVICES, Danville, PA 17822. An Equal Opportunity Employer, M/F/H.

Geisinger

CLINICAL DATA PROCESSING POSITIONS

Sterling-Winthrop Research Institute, the research division of Sterling Drug Inc., a major pharmaceutical company announces openings in the Clinical Data Processing Group of our Research Systems Department.

SUPERVISOR

Candidates should have a Bachelor of Science Degree with 4 years of clinical data processing experience, 2 years of supervisory experience, and an in-depth knowledge of SAS, especially its report generating capabilities. Familiarity with VM/CMS is desirable.

SAS PROGRAMMER

Candidates should have a Bachelor of Science Degree with 1 or more years of SAS programming experience. A knowledge of VM/CMS and data base management is also desirable.

We offer a state-of-the-art environment, excellent salary and benefits, and potential for advancement. Interested, qualified persons should send resume and salary requirements in confidence to:

Nancy E. Laranjo
Employee Relations Administrator

BUSINESS OPPORTUNITY

EXPANDING TO BRITAIN OR EUROPE?

We are European market entry specialists. We move American companies into new & profitable British & European markets.

We evaluate markets, find financing, identify trading partners, arrange joint ventures & set up licensing & distribution agreements. We locate appropriate sites, cut red tape, secure permits, obtain visas & create appropriate corporate & tax structures.

We guide US companies through the intricate maze of UK/European expansion. And we save our clients a great deal of management time & money.

If you are considering expanding your business into new European markets, consider speaking to us first.

STERLING CORPORATE SERVICES LIMITED
97-99 Park Street,
London W1Y 3HA.
Tel: 01-629 8006.
International: 44 1 629 8006.
Telex: 264581.

Don't trust us to keep your classified information secret

Every week, we deliver more of your target audience than anyone else. Over 600,000 computer-involved professionals. Including MIS/DP directors, systems analysts, programmers, and engineers — as well as corporate presidents, treasurers, and general managers.

And we deliver these readers for less. Compare costs and the people reached. You'll see that Computerworld is the number one medium for reaching MIS/DP professionals.

Our readers rely on Computerworld's classified section. In fact, 41% of our subscribers read the recruitment section every week. And 85% of our subscribers read this section regularly.

Readership like this means responses. Just ask some of the 4,000 organizations that ran more than 6,500 recruitment ads in Computerworld in 1984.

We make your ads work harder. Because we divide the classified section into logical categories: Position Announcements; Buy, Sell, Swap; Software For Sale; Time & Services; and The Bulletin Board. (Available on request: Software Wanted; Business Opportunities; and Real Estate).

So the people you want to reach will spend less time looking for your ad, and more time reading it.

We'll even typeset your ad at no extra charge. All you need to do is attach clean typewritten copy to your order. (Figure about 25 words per column inch, not including headlines). Or give us your order over the phone. We'll do the rest.

And since we're published weekly, we can offer you a fast turnaround from when you place your order to when your ad appears. As little as 10 days.

The next time you want results, advertise in Computerworld classified pages. Call toll-free at (800) 343-6474. In Massachusetts, call (617) 879-0700. Call now.

BIDS & PROPOSALS

OHIO TURNPIKE COMMISSION
682 Prospect Street
Berea, Ohio 44017

REQUEST FOR PROPOSALS

OTP 84-85-01

Proposals are requested by the Ohio Turnpike Commission for Toll-Audit Lane and associated equipment, embedded software and related services to replace certain obsolescent equipment and to provide, together with retained existing equipment, a modern, state-of-the-art ticket handling system and to integrate same into the existing data processing system.

The Proposals will be received at the Commission's offices, 682 Prospect Street, Berea, Ohio 44017 until 10:00 a.m. (E.D.S.T.), September 20, 1985.

Plans and specifications for said Request for Proposals, including a form of affidavit to accompany any such Proposal, are on file and available at the office of the Commission's Director of Operations. These documents will be forwarded upon request and without charge to any interested party.

The Commission expects to retain its existing equipment, except entrance and exit terminals for use in collector-attended lanes, automatic ticket-issuing machines, batch ticket units and ticket certifiers. Any equipment furnished must be integrated and interfaced with existing lane equipment. Such new equipment must be consistent with system audit capability, and must provide state-of-the-art enhancement of existing functions.

Each Proposal must be accompanied by a Proposal Guaranty in the form of a bond or certified check in the sum of Fifty Thousand ($50,000.00) Dollars. The proceeds of any such check may be retained by the Commission and liability will accrue on any such bond in the event of refusal to execute a contract and furnish a performance bond in the amount and under the conditions set forth in the Request for Proposal. Otherwise, such check will be returned and such bond will become null and void.

The Commission will enter into a single contract for the furnishing of the equipment and services required, if any contract be made. The Commission reserves the right to reject any or all Proposals and the right to waive technicalities.

OF THE BIG THREE IN BUSINESS SOFTWARE, WHO'S THE REAL NUMBER ONE?

If you know corporate software, you know that only three companies are really capable of offering a "total solution" product line. Everything from general ledger to a PC link with your mainframe.

And if your company's sales are $100 million or more, the amount you're likely to invest in corporate software is of such magnitude you undoubtedly should talk to all three.

Not only will you become a more informed buyer, but a more satisfied owner after you buy.

Our recommendation to shop the big three is offered with confidence. And with certainty that once a competitive evaluation ensues, the chance of your choosing McCormack & Dodge easily exceeds one in three. Because, not long after you begin your analysis, the differences will become apparent. Differences in what each company actually means when it claims to have a total software solution, and a totally integrated software line.

We believe your evaluation will show you this:

Two companies offer the mere appearance of integration. An agglomeration of business applications linked superficially. Through a web of hinges, patches, bridges, shadow files and masks lurking just below the surface.

While one offers the real thing. Millennium. A true family of systems in which the whole works as smoothly as any part. In which every package has the same query mechanism, the same report writers, the same screen generation, the same on-line documentation, security and real-time capabilities. So that when the packages are put together, there are absolutely no borders between them. They fit like pieces in a jigsaw puzzle. Making the most efficient use of all your data processing resources. There's even a Millennium application development tool, so you can create new systems as you need them. Without slow, expensive programming.

Millennium means integration in fact. Not just in name. And it is available only from McCormack & Dodge.

Of the big three in software, who's really number one?

Don't stop asking until you know.

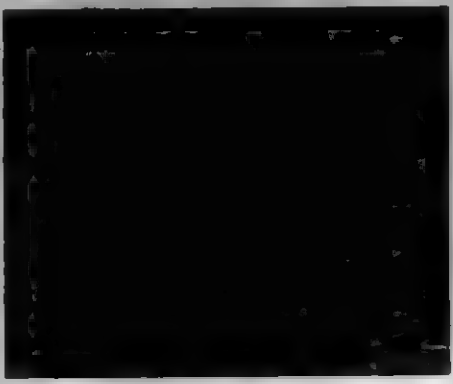
Slumping mini firms act to calm users

By Clinton Wilder
CW Staff

Fourteen months ago, the Henley Paper Co. in Greensboro, N.C., decided that Wang Laboratories, Inc. would be its main computer vendor. The firm committed to purchasing a Wang VS 100, with plans for a future VS 300 upgrade, a VS 65, four VS 15s and 75 workstations. "We are dependent on Wang in the near term and the long term," DP administrator Ray Andersen said. "We're very dependent on [its] future."

But Wang's future has become clouded in recent months. Although companies from IBM on down have announced lower earnings or losses, the losses and layoffs at Wang and Data General Corp., coming after years of virtually uninterrupted and spectacular success, have been particularly shocking. Both companies are currently in transition as they seek to reverse recent setbacks, and users, analysts and company executives are watching anxiously to see if they will succeed.

"I have a concern about it," Anderson said of continued customer service from Wang, "but it's the same with the industry. Wang's not unique. I'd feel more secure in an IBM environment, just because [IBM is] so large, but I still look first at what applications software is out there. If software led me to IBM, great, but if not, I'd still pick the other vendor, like we did with Wang. And I think [Wang is] definitely trying harder now."



Both Wang and DG have redefined their goals this year in the highly competitive office automation market, but the changes at Wang have been more fundamental and structural. The Lowell, Mass.-based Wang has eliminated a layer of middle management and has centralized its marketing approach, attempting to shed its word processing mantle for full-scale DP pitches to MIS managers.

"With our rapid growth, a lot of layers were put on top of things," said Thomas Mercer, Wang's director of product marketing. "Each [regional] branch developed its own marketing program. Now all of that is coordinated at Lowell. Branch managers are asked to come to Lowell on a quarterly basis, at a minimum."

Burned by late deliveries of the six products it announced in October 1983, Wang has vowed to restore its credibility. "Our idea is to do less but to do it better," said John Thibault, vice-president of product planning and management. "We've

Ashton-Tate in micro merger

By Maura McEnaney
CW Staff

CULVER CITY, Calif. — Intense acquisition activity within the young microcomputer software industry continued last week when data base management leader Ashton-Tate announced its intent to acquire word processing champion Multimate International Corp. for $19 million in stock and cash.

The acquisition, Ashton-Tate's second this year, not only will add the leading independent word processing package, the Multimate Professional Word Processor, to its lineup of data base and integrated software products but also will provide Ashton-Tate with broader reach into the large corporation market, where Multimate has a strong presence.

"We're trying to move Ashton-Tate from a microcomputer software company to a computer services company," Ashton-Tate President Edward Esber told *Computerworld* last week. "This clearly establishes us as a dominant supplier in the data base arena and the word processing arena."

Earlier this year, Ashton-Tate had acquired Forefront Software Corp. of Sunnyvale, Calif., author of the popular Framework program, which Ashton-Tate had been distributing. In other merger activity so far in 1985, Lotus Development Corp.

Electronic transfer: Computer pro rises at Chase

By Charles Babcock
CW New York Bureau

Arthur F. Ryan said he thinks extending bank services to consumers goes hand in hand with technology, and that is one reason he has been plucked from the ranks of data processing to head consumer banking operations at New York's Chase Manhattan Bank NA.

Named executive vice-president last November, Ryan, 42, brought an expertise in computers to what the bank said it hopes will be an expanding sector of its business.

"Banks are looking for more and more people schooled in the computer industry," said Thaddeus W. Paluszek, a banking industry analyst with Merrill Lynch, Pierce, Fenner and Smith, Inc. in New York.

Computers have become central to the banking business because of their ability to process large volumes of transactions. Instead of treating computers as a utility, however, banks are beginning to see them as crucial to their business planning and strategies. A banking service can be provided quickly if the underlying computer service is already in place, pointed out Big Eight accounting firm spokesman familiar with the banking industry.

In addition, microcomputers are beginning to help banks sell products to customers through the use of financial analysis and asset management tools, said Jan H. Linker, vice-president of the Electronic Banking, Inc. division of Bank Earnings International in Atlanta.

The promotion of DP executives into general management "is an acknowledgment by senior management that these people possess the skills needed to utilize this resource," said a Coopers & Lybrand manager in New York.

The most visible promotion of an executive skilled in computer technology was the appointment in September of John S. Reed as chairman of Citicorp, the nation's biggest bank.

Read, however, graduated from MIT in Cambridge, Mass., with the equivalent of

NEWSPAPER

Computer Inquiry III opens

WASHINGTON, D.C. — The Federal Communications Commission has proposed relaxing the major regulatory barrier that prevents the regional holding companies and AT&T from mixing computer processing services with their underlying basic telecommunications transmission.

The FCC recently opened its Third Computer Inquiry, five years after establishing its Second Computer Inquiry decision that required the former Bell operating companies and AT&T to set up separate subsidiaries if they wanted to sell enhanced computer communications products such as packet switching, voice store and forward and customer-controlled switching.

The FCC proposal, which will be open for public comment, puts forth the use of a new standard of assessing the state of competition in a given service offering instead of defining a standard of what is computer enhanced and what is not.

"We want to come up with a mechanism that encourages and does not impede growth of new services," said Albert Halprin, FCC Common Carrier Bureau chief.

The FCC said that since the divestiture of AT&T into the seven regional holding companies and AT&T, a rash of waiver requests from the separate subsidiary restrictions outlined in Computer Decision II has pushed the FCC into a role of defining what types of services could be permitted, a role Halprin said the FCC should not take on.

The result was "horribly inefficient" for services being introduced into the basic telecommunications network. The FCC said it will permit new services as long as several necessary conditions are met. The conditions include whether the service is being offered by a carrier or vendor that has control over the bottleneck local-loop facilities or long-distance network in an exchange area; whether there are other providers of similar services; and whether new players can freely enter the market.

The FCC's plan proposes retaining regulation if a carrier does maintain monopoly control over facilities and wants to offer a computer enhancement through the network. However, the policy would drop the requirement that the service be marketed through a separate subsidiary, such as AT&T Information Systems in the case of AT&T.

Instead, FCC regulation would consist of requiring the service to buy the basic transmission portion of the offering at the same rates and terms other vendors would pay for equivalent service. Additionally, the FCC would require separate accounting procedures for the enhanced service.

There are four possible new service categories affected by the proposed regulations, the FCC said. These include protocol conversion; the interconnection or co-location of a vendor's equipment at the local exchange switch owned by the carrier or another vendor to provide integrated digital services; voice message storage services; and network channel terminating equipment.

CORRECTIONS

It was reported that Fortune Systems Corp. was operating under reorganization protection [CW, July 8]. That statement was incorrect. Fortune Systems' most recent financial statement, released July 23, reported second-quarter revenue of $14.6 million and profits of $222,000.

A product announcement for Intrak, Inc.'s compiler for NCR Corp.'s V series mainframes [CW, June 10] incorrectly listed the company address. Intrak is located at 9999 Business Park Ave., San Diego, Calif. 92131.

The price for Marcam Data Systems Corp.'s Pivot RPG-III order processing, invoicing and sales analysis system for the IBM System/38 was incorrectly listed [CW, June 24]. The package is priced at $14,200.

The photographs for the In Depth story "Growing up with MS-DOS" [CW, July 22] were incorrectly credited to the author; they should have been credited to David Current.

Sortland Yard warns against "Raffles-type sort programs."

Call (201) 568-9700.

Ask for Inspector SyncSort!

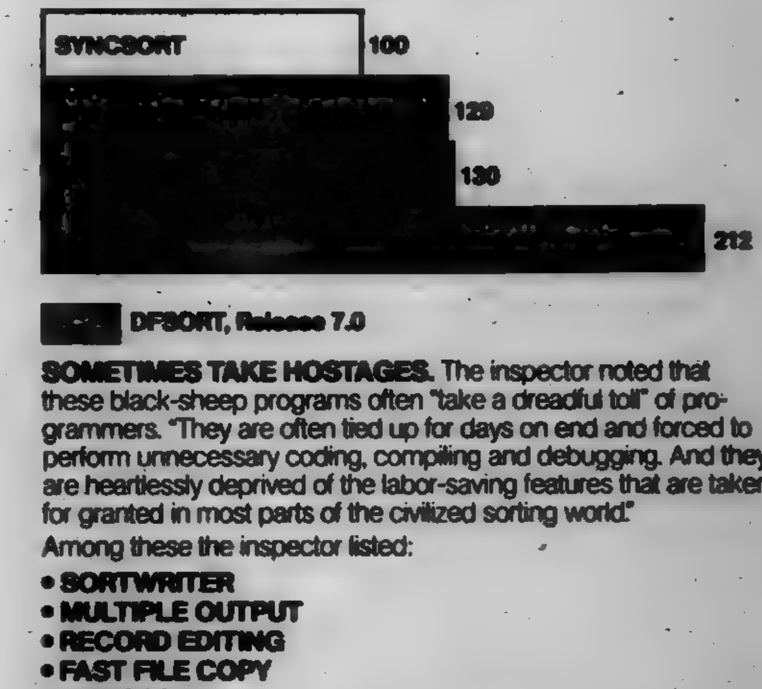
In an extraordinary move, Sortland Yard today warned data processors throughout the world to be on guard against what it termed "gentleman-bandit sort programs."

The warning was issued by one of the Yard's best known figures, Inspector SyncSort, who has sometimes been called "a legend in his own CPU time."

The inspector said, "One of the difficulties in apprehending these chaps is that they look so eminently respectable. They're members of a fine old hardware family. They've been to the right schools. And they invariably carry out their burglaries while wearing a dinner jacket from Saville Row."

EXPERT COMPUTER CRACKERS. "But once the party is underway," the inspector said, "these chaps head straight for the place where the family jewels are kept. They can crack open a computer and make off with a king's ransom in computer resources before you can say 'Hound of the Baskervilles.'"

To indicate "the true cost of this sort of misbehavior," the inspector released the following crime statistics:



SOMETIMES TAKE HOSTAGES. The inspector noted that these black-sheep programs often "take a dreadful toll" of programmers. "They are often tied up for days on end and forced to perform unnecessary coding, compiling and debugging. And they are heartlessly deprived of the labor-saving features that are taken for granted in most parts of the civilized sorting world."

Among these the inspector listed:

- **SORTWRITER**
- **MULTIPLE OUTPUT**
- **RECORD EDITING**
- **FAST FILE COPY**
- **MAXSORT**

TELEPHONE BEST DEFENSE. The inspector urged data processors to call the Yard immediately if they suspect their center is infested by a Raffles-type sort program. "The number is (201) 568-9700. We'll send over one of our highly trained sort detectives to track the culprit down."

Questioned as to what would be done with sort programs caught burglarizing computer centers, the inspector replied, "They will be given a just and speedy trial. If found guilty, they will immediately be transported to Iran!"

Syncsort Incorporated 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

DEC ports All-In-One software to 32-bit Microvax II

By John Desmond
CW Staff

MERRIMACK, N.H. — Furthering its push into the office automation competition, Digital Equipment Corp. last week announced that its All-In-One Office and Information System software is now available for the 32-bit Microvax II supermicrocomputer.

All-In-One on the Microvax is said to offer the same functions that are available on the VAX. The Microvax All-In-One includes WPS-Plus for word processing, All-In-One Mail, Time Management, Desk Management, Information Management, Help functions and computer-based instruction and costs $12,600. Customers need the All-In-One Generator Package running on the VAX-11/750 or larger systems to customize the Microvax II software, according to the vendor.

DEC also acknowledged the widespread presence of the IBM Personal Computer in the office by announcing various software packages that allow the IBM micro to communicate with the Microvax II and VAX systems.

'A way to fight back'

The All-In-One announcement "is important because IBM is attacking at the low end of the office market with the System/36, and DEC needed a way to fight back at that level of machine," in the view of George Colony, president of Forrester Research, Inc. in Cambridge, Mass.

The move also gives DEC users a low-end entry into All-In-One, previously available only on a more expensive VAX superminicomputer. "Large users can now get a taste of All-In-One as a sort of pilot system," Colony said. "It was such an all-or-nothing type sale in the past."

Gene Hodges, manager of market development in DEC's Office Information Systems Division, pointed to the ability to build distributed systems with the Microvax II All-In-One software, which is compatible up the line of VAX hardware.

Colony said, "In the distributed office systems environment, [the new software] is a perfect link with the larger All-In-One" running on other VAXs.

Decnet-DOS for Microvax II

The DEC announcements also included Decnet-DOS for the Microvax II, a $500 package that allows IBM Personal Computers to participate as end nodes in Decnet networks based on the Microvax II and other VAXs.

Among other introductions, DEC announced software permitting IBM Personal Computers and compatibles to emulate DEC terminals to the Microvax II. Vterm II software allows the IBM Personal Computer to emulate a DEC VT100 terminal, for file transfer from the IBM micro to a Microvax II or VAX system. Vterm II is priced at $160.

Poly-Com 220 and 240 emulation packages, developed by Polygon Associates, Inc., allow IBM Personal Computers to emulate DEC VT200 terminals to VAX systems. The packages cost $200 and $300, respectively.

Colony called the price of linking the IBM Personal Computer to the Microvax II a possible stumbling block, saying it may be less expensive for users to use DEC terminal emulation software from independent vendors.

Runs with 5M bytes of memory

All-In-One software runs under the MicroVMS operating system on the Microvax II with a minimum of 5M bytes of memory. The All-In-One Generator Package costs $6,500. Runtime licenses for customized packages cost $12,600 for each Microvax II system.

The cost for a Microvax II system with 16 active users and 30 subscribers, 9M bytes of memory, Decnet, Xerox Corp. Ethernet and terminal services, 30 VT220 terminals and All-In-One software that offers word processing, electronic mail, time management and administrative support, costs slightly more than $120,000 — approximately $4,000 for each subscriber.

DEC announced that the A-to-Z Integrated Software development package is also available on the Microvax II. A-to-Z integrates graphics, word processing and spreadsheets with customized business applications. Software modules of A-to-Z on the Microvax II cost $1,395 for word processing, data management and business graphics. The A-to-Z Base System costs $1,295. The A-to-Z Integration Kit costs $1,395.

DEC is located in Maynard, Mass. 01754.

Datapoint unveils color, full-motion video unit

By Charles Babcock
CW New York Bureau

NEW YORK — Datapoint Corp. has announced a workstation with full-motion, color video and voice communications for use on a network of IBM Personal Computers or Personal Computer-compatible units.

The Multimedia Information Network Exchange, or Minx, workstation consists of a high-resolution color monitor, a color motion picture camera, a viewfinder and a full-duplex speakerphone and is plugged into the Personal Computer, taking the place of the Personal Computer monitor. It allows videoconferencing among any number of users on the network, company officials said. The video portion of the conference is voice activated, with each user's screen showing whoever is speaking, company officials said.

Although Datapoint officials said the system can be geared for use with any personal computer, it has been implemented only for IBM Personal Computers and compatibles so far. It may be used with Datapoint's Vista-PC, an IBM Personal Computer-compatible, including an Intel Corp. 80186 microprocessor.

George L. Leonard, director of marketing for Datapoint's Advanced Products Division, the new unit that developed the Minx, said 8-bit microprocessors in the Zilog, Inc. Z80 family run the workstation and cluster servers that manage communications between up to eight workstations and the rest of a network.

In a basic eight-workstation cluster, each workstation is priced at $9,990, plus $9,200 for the cluster server. In addition, a $400 keypad is needed for dialing on the system and a $495 interface cable connects the unit to the Personal Computer.

When purchased with a Vista-PC, each workstation in a cluster of eight is priced at $14,385.

Leonard said the Minx is available now, with shipments to customers who have already placed orders starting later this month. The Minx system is intended for use on local-area networks, including Datapoint's Arcnet local-area net, and larger networks, company officials said.

Eight workstations can be connected to a cluster server through a single coaxial cable; the maximum distance between server and workstation is 1,000 feet. Larger networks of more than 200 users and 32 cluster servers can be built with industry standard, broadband networks, company officials said.

Workstations on Datapoint's baseband Arcnet can be connected to a more extensive broadband network through modem gateways that convert baseband signals to broadband, Leonard said.

The Minx workstation may also be used without being connected to a personal computer for voice and video communications, but it then loses the capacity for data communications, company officials said.

In addition to the normal configuration, standard video equipment may be attached to the workstation and used with it — video cameras, video recorders, monochrome document cameras or closed circuit video sources, such as news or business programming, company officials said. For private conversations, a telephone handset may be attached, the officials added.

Datapoint is located at 9725 Datapoint Drive, San Antonio, Texas 78284.

Looking for live stories on terminal technologies

New technologies have dramatically changed traditional data communications terminals. Now display and graphics terminals are available for the corporate and DP environment that feature a wide and impressive range of capabilities.

The *Computerworld* October Special Report on data communications terminals will examine some of these new terminal technologies, specifically high-resolution color graphics terminals and terminals with integrated voice/data telecommunications options.

The Oct. 28 report will also address the pros and cons of terminal communications as opposed to microcomputer communications from a data processing perspective.

Article contributions are now being considered for publication in the report. Submissions should take one of two forms:

- A tutorial article discussing an issue or a trend.
- An application story outlining a particular user's experience with data communications terminals.

The deadline for contributions is Aug. 30.

Articles must be typed, double-spaced and range in length from three to five pages. Artwork such as charts, graphs and photos is encouraged.

If you have a story you would like to tell or an opinion you would like to express, contact Janet Fiderio, Special Reports Editor, *Computerworld*, 375 Cochituate Road, Box 880, Framingham, MA 01701.

Second-class postage paid at Framingham, Mass., and additional mailing offices.

Freeing business from computer languages first began with Computer Corporation of America.

But keep it quiet. We did.

We're making it easier for management and computers to talk direct. Quietly and easily.

After all, our founders over 20 years ago were a computer scientist and a psychologist. So our focus literally began with creating software that let people more easily communicate with computers.

And our first contribution was the earliest example of fourth generation language.

One of the latest, is the Intelligent Information Center. And with it, your business executives can use their personal computers to access and use the firm's mainframe computer data direct.

To speak in slightly technical terms, the IIC is a language free, decision support query and report writing system that's menu driven and syntax free. In fact, it's just about keyboard free.

Your executives can write their own reports or use mainframe data on their favorite spreadsheet in the office or at home.

The Intelligent Information Center is already proven in industry use, to be a very powerful, very flexible link between mainframes and people. The non-computer-expert type of people.

Just like our founders would have wanted.

We'd like to tell you more about our advanced technology, from our very powerful MODEL 204 database software, to our other application development tools for business.

Write John Donnelly, VP Marketing, Computer Corporation of America, Four Cambridge Center, Cambridge, MA 02142. Or call 1-800-258-4100.

Software innovators creating better ways to manage business.

Wang offers 80286-based micro

By Eric Bender
CW Staff

LOWELL, Mass. — Wang Laboratories, Inc. took conflicting steps in its cautious dance toward the IBM Personal Computer standard last week, as it launched a non-IBM-compatible Advanced Professional Computer along with three products linking the IBM micro with Wang VS minis.

The Advanced Professional Computer is completely compatible with the company's Professional Computer, permitting users to upgrade to the new design by swapping system boards, and it runs comparable software up to twice as fast as the IBM Personal Computer AT, Wang officials claimed.

However, industry analysts generally registered surprise that Wang did not make the system compatible with the AT. "I don't understand why they're still resisting the full IBM-compatibility issue," commented Tom Billadeau, president of TRB & Associates, Inc. in Ogunquit, Maine.

Available now at a starting price of $3,465, which does not include a monitor, the machine is built around an 8-MHz Intel Corp. 80286 chip and features 512K bytes of internal memory, which is expandable to 2M bytes on the system board.

The system acts as a single-user workstation under Microsoft Corp.'s MS-DOS 2.11 or supports up to four users under Microsoft's Xenix. More than 600 MS-DOS applications are available, and an emulation option allows about 90% of IBM microcomputer applications to run, the company said.

Last week's introductions also included Wang Word Processing for the IBM Personal Computer, the Wang Local Office Connection and the Wang Remote Office Connection, all said to work with the Personal Computer and Personal Computer XT but not with the AT.

The word processing package includes the company's widely used software, a replacement keyboard that handles both Wang and IBM functions and an interactive tutorial. Priced at $695, the package is scheduled for October shipment.

Wang's Local Office Connection enables the IBM micro to act as a VS workstation, giving access to host resources such as printers, storage devices, communications options and Wang Office and other system applications. All VS terminal functions are supported except graphics display on the IBM monitor, the company said. The product consists of an emulation card, a coaxial link to the host, word processing software and a replacement keyboard. The Local Office Connection costs $1,895, and delivery is expected in December.

The Remote Office Connection combines a word processing package and keyboard with a Wang Systems Network component originally announced in June 1984 and never shipped.

The connection permits Personal Computer users to hook up to a Wang VS minicomputer over point-to-point or multipoint synchronous links at speeds up to 9.6K bit/sec. and to run VS applications, Wang said. The product also allows users to transmit or retrieve for editing word processing documents to and from the VS and to store binary files on the larger system. The Remote Office Connection costs $1,200 and is slated for October availability.

The standard Advanced Professional Computer comes with a five-slot chassis, serial and parallel ports, keyboard and a single 360K-byte floppy disk drive. Another version with an eight-slot chassis and a 1.2M-byte floppy disk drive is priced at $3,900. A system upgrade from the Professional Computer costs $2,000.

Among other options are a Character/Graphics/IBM Emulation (CGI) card that combines IBM monochrome character, Wang monochrome graphics and IBM monochrome emulation and keyboard control for $655; a $1,000 20M-byte, half-height hard disk drive and a $4,400 67M-byte full-height hard disk drive, each requiring a $595 controller; a 43M-byte

DG unveils IBM-like desktop

By Edward Warner
CW Staff

WESTBORO, Mass. — In an effort to capitalize on the escalating trend that sees users linking office personal computers with departmental minicomputers, Data General Corp. has introduced its first IBM-compatible desktop personal computer. At the same time, DG doubled the number of users supported by its Eclipse MV/4000 DC minicomputer.

To take the computing-intensive task of word processing off the MV/4000, DG capped the rollout with the introduction of CEOwrite, a Microsoft Corp. MS-DOS-based word processing program. DG said CEOwrite will integrate with DG's CEO office automation software to permit document sharing via the MV/4000 DC. With word processing taking place off-line, the MV/4000 DC will be considerably faster, the company added.

The star of last week's rollout, however, was the Dasher/One, a 256K-byte personal computer offered in two models, each with a 12-in. green-screen monitor and at least one 3½-in., 720K-byte diskette drive. The machines will be directly marketed both to new customers and to DG's installed base of minicomputer users, according to Lou Delzompo, DG senior product manager for workstations and communications.

The Dasher/One is not a complete clone of the IBM Personal Computer, however. For one thing, it uses 3½-in. diskette drives, rather than the Personal Computer's 5¼-in. drives. Delzompo said the Dasher/One has 3½-in. drives because that is the size of the drives in DG's first IBM-compatible personal computer, the laptop portable DG/One, introduced last fall.

He also noted another incompatibility with the Personal Computer: The Dasher/One will not accommodate Personal Computer-compatible option boards. DG will introduce its own line of option boards for the machine, Delzompo said.

Delzompo said DG waited until now to introduce an IBM-compatible desktop because there "wasn't a clear user demand from our customers." It was also not until recently that decreases in hardware costs permitted the creation of an IBM-compatible priced similarly to an intelligent terminal, he added.

Pricing concerns, he said, were also behind the use of the Intel Corp. 8088 microprocessor in the Dasher/One. Nearly all of the latest personal computers for the office, including the Wang Laboratories, Inc. Advanced Professional Computer (see story at left), use the Intel 80286 chip, the high-speed processor used in the IBM Personal Computer AT.

Users access CEO features

Using DG's CEO Connection software — introduced in February for the DG/One — the Dasher/One, the DG/One and the IBM Personal Computer reportedly can operate as MV/4000 DC workstations, accessing CEO software. As a result, DG said, workstation users can access such CEO features as electronic mail and filing, calendaring, word processing and decision support. CEO Connection costs $295 for the Dasher/One and DG/One and $395 for the Personal Computer. A version for machines under DG's AOS/VS operating system costs from $1,600 to $3,250, depending on the CPU.

The $2,100 Dasher/One Model 1, based on the Intel 8088 microprocessor, reportedly runs all IBM Personal Computer software at the IBM machine's standard 4-MHz clock speed. The $2,415 Dasher/One Model 2, based on the Intel 8088-2 chip, offers users a switch-selectable chip speed of either 4 Mhz or 8 MHz, a second 3½-in., 720K-byte diskette drive and screen resolution of either 200 by 800 pixels or 400 by 600 pixels, the latter for use with text.

Users may, at no extra cost, choose either of two keyboards, one similar to that of the IBM Personal Computer AT and the other designed specifically for use with the CEO software, DG said. Options for both models include a 10M-byte internal hard disk, a sec-

Wang, DG debuts draw little enthusiasm from analysts

By Edward Warner
and Eric Bender
CW Staff

ANALYSIS

Most analysts reacted with relatively little excitement to Wang Laboratories, Inc.'s and Data General Corp.'s announcements of personal computers and software last week.

Indicative of the responses were the comments of Kenneth Bosomworth, president of International Resource Development, Inc., a Norwalk, Conn., market research firm. "There's no suggestion that these companies have any new ideas to bring to the market," Bosomworth said. "It [looks] more like a lack of strategy — like lemmings [jumping] into the ocean, just falling over each other."

Tom Billadeau, president of TRB & Associates, Inc., a research firm in Ogunquit, Maine, expressed disappointment that Wang did not become the first major computer vendor to introduce an AT-compatible machine.

Bosomworth also downplayed the importance of the new Wang system. "I would be really hard pressed," Bosomworth commented, "to see a reason to buy that machine over the AT."

Having unveiled a desktop machine that is not compatible with the latest IBM offering, Wang is still bucking the Big Blue trend, said George Weiss, president of Quantum Science Corp. in New York. "Our research shows that workstation procurement in large organizations is almost exclusively IBM or IBM-compatible products," according to Weiss. "It's a difficult time for Wang, DG and [Digital Equipment Corp.] to make inroads in the workstation marketplace."

DG's introduction — an IBM-compatible personal computer that can operate as a workstation with the DG MV/4000 DC minicomputer — received a favorable reaction from analyst George Colony. According to Colony, president of Forrester Research, Inc. in Cambridge, Mass., DG was "giving users the alternative of attaching to CEO [DG's office automation software] on the MV/4000 via a terminal or attaching a personal computer to that departmental system and getting some resource distribution."

On the software side, analysts reacted more positively. Of the debut of DG's Ceowrite for off-line word processing on either the Dasher/One or IBM Personal Computer, Colony said that taking word processing off the MV/4000 means that users "are going to get better performance out of CEO [software]."

Billadeau, too, liked the idea of Ceowrite, which he said was important for its ability to span a wide range of DG systems. He also said he liked the choice of three user interfaces for the word processor. "You can turn on menus ad nauseum, or go way down to the control level."

Wang's enhanced communications offerings also received good reviews, although analysts noted some limitations of the products.

Wang's workstation strategy "enables us to welcome wholeheartedly the IBM Personal Computer into the Wang fold and opens the VS family to IBM Personal Computer users," said J. Carl Masi, senior vice-president for worldwide sales and marketing, at last week's announcement.

But such fine sentiments have not yet made the IBM Personal Computer a true family member, Billadeau said. "It's clearly a stepchild."

ORACLE

The portable version of IBM's DB2 and SQL/DS

COMPATIBILITY

The ORACLE relational database management system is fully compatible with IBM's SQL/DS and DB2. SQL/DS and DB2 represent IBM's latest generation of database management technology for IBM's largest computers. ORACLE's capabilities and user interface - the SQL language - are identical to those of SQL/DS and DB2. Programs written for SQL/DS and DB2 will run unmodified on ORACLE.

PORTABILITY

SQL/DS and DB2 run only on IBM mainframes; ORACLE runs on IBM mainframes, DEC, DG, AT&T, HP, STRATUS, and several other manufacturers' minicomputers, and on a wide range of microcomputers including the IBM PC/XT and PC/AT. All versions of ORACLE are identical and include a complete implementation of SQL – not a subset.

CONNECTABILITY

Having the same software running on your mainframe, minis, and micros greatly simplifies the task of connecting your machines into a network. ORACLE's network software allows microcomputer users to directly access data stored in the shared database on the mainframe or minicomputer, or copy that data into the database on their micros and operate independently.

Oracle introduced the first relational DBMS and the first implementation of SQL back in 1979. Today, eight of the ten largest U.S. companies use ORACLE. In fact, INC MAGAZINE ranks Oracle as the fastest-growing software company in the USA. Surprised? Don't be. ORACLE is the number one relational DBMS, with thousands of installations on IBM mainframes, DEC, DG, AT&T, HP, STRATUS and most other vendors' minis and micros. Even the IBM PC.

To attend the next free, half-day seminar in your area or receive additional information, write Oracle Corp., Dept. C4, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350. Following is the ORACLE seminar schedule:

DOWN from page 1

asked ourselves, 'Do we really need so many versions, colors and variations?' [The slump] has given us a chance to clean up our product lines and focus on what's really important. It's time to put the [late delivery] ghost to rest."

Most users and third-party representatives interviewed recently praised Wang's new approach. "They're being more realistic about what products they intend to ship and when they intend to ship them, which I think is great," said David Cort of Pacific Edge Systems, a Los Angeles consulting firm specializing in Wang software. "I think it relates directly to their bad press and financial pressures."

The fiscal pressure has been brutal: Wang reported a $109 million loss in the quarter ended June 30, swallowing a $137 million inventory writedown and costs related to 1,600 layoffs. At a company that had come to expect 30% to 40% growth as the norm, the fiscal 1985 balance sheet saw revenue climb a mere 8% to $2.35 billion and profits tumble from $210.2 million in the prior year to $15.5 million.

In nearby Westboro, Mass., DG's most recent quarter was not much brighter. The company posted an $8.3 million loss and a 6% decline in sales. DG's cost-cutting program included the release of 1,400 employees.

'Shakes up users'

"Of course, that shakes up users," said Peter Lowber, a minicomputer industry analyst with the Boston-based Yankee Group. "But these are big organizations; they still have more money for [research and development] than startups. It's a question of not scattering it around. They're not going to suddenly evaporate, but they have to rethink things and choose their targets carefully."

DG, taking a financial beating in its scientific/technical and small business OEM sales, has now invested heavily in targeting Wang's traditional OA market. But where Wang approached the office through the desktop word processor, DG came in from the back room housing the supermini CPU.

"[OA] has really become a system product," said Robert Miller, senior vice-president of DG's Business Group. "With us and [Digital Equipment Corp.], that plays to our strength. But we have an uphill fight to demonstrate that our product is a superior solution. We have to convince the end users of the IBM tradition that we can support them and not just OEMs."

Miller, like Wang officials, insisted that DG's fiscal losses have not cut the meat out of R&D, only the fat. "There are some things on our 'we'd like to do' list that we're not going to get to," he said, "but we've been careful to have no drain on R&D in critical areas like [OA]. Our cost cuts have lightened the boat, but we don't want to do anything to the engine that runs it."

Miller admitted that customers may feel IBM is the safest port in the industry storm but contended that DG's recent news has not shaken its own reputation. Except for consolidating the formerly separate dealer sales unit into its North American sales division, DG has not reacted to the downturn with major organizational changes, Miller said.

"We're basically battening down the hatches and riding it through," he said. "Even though the layoffs look the same [as Wang's situation], the stability of our management speaks for itself."

Richard Swan, DP manager of the DG-based shop at L. S. Starrett Co. in Athol, Mass., said he has not seen any changes. "Our salesman was a victim [of layoffs], but we seem to have a very capable replacement," he said.

WANG from page 6

streaming cartridge tape drive for $2,500; a 512K-byte, user-installable memory upgrade for $580; and an Intel Corp. 80287 numeric coprocessor priced at $375.

Xenix System III will be offered next month for $995. Multiuser configurations require use of Internal Workstations, new Wang bit-mapped terminals that have a base price of $1,835 for all but the system monitor.

A four-user Advanced Personal Computer configuration with an eight-slot chassis, 2M bytes of internal memory, a 1.2M-byte disk drive, 67M-byte Winchester drive, monochrome monitor with CGI card, three Internal Workstations, four keyboards and Xenix will cost $17,465, the company said.

Wang also intends to offer Interactive System Corp.'s IN/IX, another AT&T Unix version, on both the Professional Computer and the Advanced Professional Computer in second-quarter 1986.

IN/IX role on larger systems

Hinting at a role for IN/IX on larger Wang systems, Helayne Jones, director of desktop systems, said the operating system "is tied closer to our strategy than Xenix is." However, no IN/IX pricing was announced.

Additionally, Wang said it will open its architecture for the Professional Computer line, offering specifications to third-party software and hardware developers.

More information is available from Wang at One Industrial Ave., Lowell, Mass. 01851.

DG from page 6

ond 3½-in. diskette drive and up to 640K bytes of internal memory. With two diskette drives, the Model 1 is $2,565, and the Model 2 is $2,880. With a 10M-byte internal hard disk and one diskette drive, the Model 1 is $3,460, and the Model 2 is $3,775. With 640K bytes of memory, one diskette drive and a 10M-byte hard disk, the Model 1 is $4,095, and the Model 2 is $4,410.

Delzompo said the MV/4000 DC was enhanced to support up to 32 users, twice the previous number, as a statement of support for the departmental cluster concept, under which personal computers are linked with a mini acting as a file server. When running CEO, however, only 24 users are supported because of the need to free ports for use with printers, he noted.

A typical MV/4000 DC system, including a processor with 4M bytes of memory, 22 workstations, an IEEE 802.3 transceiver and cable, two 120M-byte disk drives, a diskette drive, three letter-quality printers and DG's AOS/VS operating system package, which includes CEO, costs $107,448.

Also introduced for use with the Dasher/One was the $650 Model 4467 printer, a daisywheel printer offering underlining, bold printing and subscripting and superscripting, among other features, according to the vendor.

Additional information is available from DG's Information Systems Division, 4400 Computer Drive, Westboro, Mass. 01581.

ACQUIRE from page 1

of Cambridge, Mass., acquired the assets of Wellesley, Mass.-based Software Arts, Inc., including the now-defunct Visicalc program; and Software Publishing, Inc. acquired Harvard Software, Inc. and its market-leading project management product line.

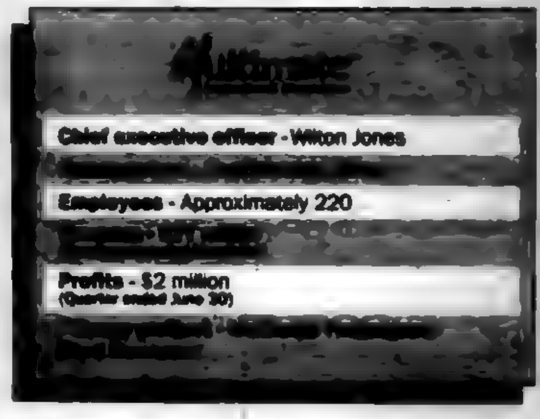
Analysts have been predicting for some time that successful small software vendors will be grabbed by the few larger companies as the still-young industry goes through a maturation process and shakes out the hundreds of one-product companies that lack marketing resources.

One industry insider recently told *Computerworld* that the four leading microcomputer software companies — Ashton-Tate, Lotus, Software Publishing and Microsoft Corp. — could virtually have their pick of smaller companies seeking acquisition by the giants. "Each of these four has a table virtually full of offers from smaller vendors," according to Benjamin Rosen of the Sevin-Rosen venture capital firm, "and they can now mix and match to fit their own product lines [best]."

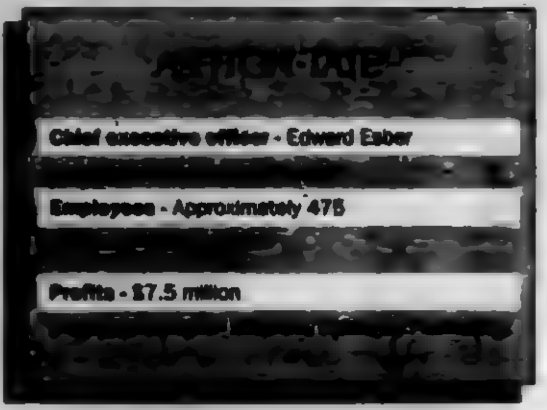
Series of consolidations

Concerning the Multimate/Ashton-Tate pairing, Bill Ablondi of Future Computing, Inc. noted that it is the first in what could be a series of consolidations among the leaders of microcomputer software companies. "Ashton-Tate won't be the only one acquiring other firms that lack some distribution skills," he said. It may not be the last of Ashton-Tate's acquisitions as well, according to Ablondi.

The acquisition also gives Ashton-Tate a strong East Coast presence and a pipeline into the substantial East Coast programmer talent pool, a critical consideration in future Ashton-Tate software development plans. The Southern California-based firm has been seeking such a base for some time



Multimate
Chief executive officer - Wilton Jones
Employees - Approximately 220
Profits - $2 million
(Quarter ended June 30)



Ashton-Tate
Chief executive officer - Edward Esber
Employees - Approximately 475
Profits - $7.5 million

and has been in ardent pursuit of Software Arts, before that acquisition candidate chose to be swallowed up by Lotus.

In the fiscal year ended Jan. 31, publicly held Ashton-Tate's sales were $82 million and profits were $7.5 million, ranking it behind micro software vendor Lotus, which had a revenue of $156.9 million.

Founded in 1980 by Hal Lashlee and the late George Tate, Ashton-Tate's product line includes Dbase II, a popular data base package, Dbase III and Framework, an integrated spreadsheet, graphics, data management, forms processing and outline generator package.

Multimate was founded in 1982 under the name Softword Systems, Inc., by programmer Wilton Jones. In 1984, the company changed its name to Multimate.

East Hartford, Conn.-based Multimate claims to have approximately 30% to 35% market penetration of microcomputer word processing software within corporate installations. Multimate's Executive Vice-President Richard Lefebvre said his company plans to take advantage of Ashton-Tate's established marketing and distribution network.

Shareholders of privately held Multimate will receive one million shares of Ashton-Tate stock, valued in excess of $11 million, and cash for a total package value of $19 million. Multimate will be operated as a wholly owned subsidiary of Ashton-Tate.

The merger agreement must be approved by the boards of directors at both companies and is expected to be finalized by November, company officials said.

In June, Multimate announced plans to port its word processing software to the IBM System/36 minicomputer and to IBM mainframes. Esber said Ashton-Tate will reassess the prospects for mainframe versions of Multimate.

At the time of the announcement, Multimate indicated it had enough cash on hand to complete the project. "The [Ashton-Tate] deal was not made for financial reasons," Lefebvre said.

Ashton-Tate was actively seeking a merger partner in the word processing arena, according to Esber. Chief competitor Lotus currently has no strong word processing element in its product line.

PE supermini bolsters parallel processing offerings

By Tom Henkel
CW Senior Editor

OCEANPORT, N.J. — Claiming to have completed the second major step toward making a parallel CPU architecture the mainstay of its product offerings, Perkin-Elmer Corp. last week added a mid-range parallel configuration to its Series 3200 line of superminicomputers.

Called the 3230MPS, the system is based on a newly announced mid-range uniprocessor, the 3230XP, which serves as a host in the 3230MPS configuration. To the 3230XP, users can add up to six processors that function with the 3230XP in a tightly coupled fashion. The add-on processors can consist of auxiliary processing units, I/O processing units or a combined auxiliary processing-I/O processing unit.

The 3230MPS is the second parallel configuration announced by PE in the past six months. In January, the company announced the 3260MPS, a high-end parallel system based on its 3250XP processor [CW, Feb. 4].

The two parallel configurations come in the face of stiffer competition for a share of the scientific-oriented superminicomputer marketplace. PE, a 10-year veteran in the scientific market, is now facing competition from start-up companies offering specialized processors geared to number-crunching tasks.

Recent entrants into this marketplace, such as Intel Corp. with its Intel Personal Super Computer system, Encore Computer Corp.'s Multimax and Floating Point Systems, Inc.'s Flex/32, are hoping that systems based on multiple microprocessors will be attractive enough to end users to steal market share away from established vendors such as PE.

Said to be aimed at both scientific and commercial users in need of high computational and I/O capabilities, the 3230MPS reportedly offers users the option — by adding additional processors — of a fivefold increase in performance over a basic 3230XP processor without having to change the host CPU. The system is available with a minimum of 2M bytes of main memory but can be expanded to 16M bytes. It offers up to two direct memory access channels, each capable of supporting a data transfer rate of 10M byte/sec., the company said.

The 3230XP CPU includes 4K bytes of writable control storage, an automatic restart feature and a multiperipheral controller board. Existing users of PE's 3230 CPU can upgrade to the 3230XP configuration via a $20,000 field conversion option. In addition, each of the parallel processors that can be attached in the 3230MPS configuration offers 4K bytes of direct-mapped cache memory.

Like other members of the PE 3200 family, the 3230XP and 3230MPS can use PE's OS/32 operating system, a version of AT&T's Unix operating system.

A basic 3230XP with 1M byte of main memory costs $85,000. Additional processing units that compose the 3230MPS configuration cost $44,000 each for the auxiliary processing units and I/O processing units and 48,800 for the combined auxiliary processing-I/O processing units. A six-CPU 3230MPS configuration would cost roughly $325,000 to $500,000, the company said. The systems are available immediately.

More information can be obtained from PE, 2 Crescent Place, Oceanport, N.J. 07757.

Unit ties IBM, Net/One tools

SANTA CLARA, Calif. — Attempting to move its local-area network line squarely into large corporations, Ungermann-Bass, Inc. has announced two network interface units that enable its Net/One to communicate with IBM mainframes.

The products, NIU-74 and NIU-78, act as intermediaries between IBM 3274 controllers and Ungermann-Bass' local-area network line. The local-area net line works with four types of media: broadband, baseband, optical fiber and coaxial cable. The broadband network operates at a speed of 5M bit/sec.; the other versions work at speeds up to 10M bit/sec.

The NIU-74 sits between a Net/One network and an IBM 3274 controller. It provides up to 16 coaxial connections each at a maximum distance of 100 ft and routes information from a host to its proper place on a Net/One.

The NIU-78 supplies eight ports that can be used for IBM 3270 Type A devices. These devices can be connected through coaxial cables.

With the interface units, a Net/One network can support IBM 3278, 3279, 3178, 3179 and 3180 terminals as well as IBM 3287 and 3262 printers. The gateway works with IBM Systems Network Architecture and Binary Synchronous Communications protocols.

The NIU-74 costs $5,425, and the NIU-78 sells for $4,900.

A practical, easy-to-read text...

MVS TSO

Concepts • Commands • ISPF • CLIST

If you're developing programs under OS/MVS, you're probably using some type of time-sharing system. If that time-sharing system is TSO, a book called *MVS TSO* is for you. It zeroes in on the tasks a programmer has to do most often, so you can master TSO in a hurry.

Here's what you'll learn, whether you're using native TSO or ISPF (a menu-driven extension to TSO)

- how to create or change a data set or a library member
- how to allocate, display, print, rename, delete, move, or copy a data set
- how to compile, link-edit, and execute a program interactively
- how to debug a COBOL program interactively—that is, how to monitor the program's execution, look at the contents of data fields, watch the order in which subprograms execute, and so on
- how to start and control background processing for batch jobs (a background job doesn't run in your time-sharing region, so your terminal's not tied up as the job executes)
- why you have to use native TSO commands for some functions even if ISPF is available on your system

In short, you'll learn everything you need to know to use TSO commands or ISPF for program development.

For experienced TSO users: How to use command procedures

MVS TSO will also teach you how to use command procedures, or CLISTs. A CLIST is a series of TSO commands and statements that are executed in sequence (it's roughly equivalent to a JCL procedure). In this book, then, you'll find out:

- how to create and execute a simple CLIST for a specific job
- how to create and execute a generalized CLIST that can be used in a number of situations
- how to write a complex procedure that uses facilities much like those of a high-level language
- when and why you should write a program in a high-level language instead of using a CLIST

2 reasons why this book works

1. A technical subject like TSO is easier to master if you have plenty of practical examples to study. That's why *MVS TSO* is loaded with illustrations. For example, you'll find:

- before-and-after screen images that show you what values to enter into a screen and what the result will be
- TSO command formats that clearly explain each operand
- sample CLISTs
- schematic drawings that show how TSO works and how it relates to MVS

These illustrations not only help you understand TSO in the first place. They also serve as handy references when you're working at your terminal.

What's more, they teach you the basic patterns of TSO commands and ISPF options. So you won't have any trouble looking up new features in the IBM manuals or other references when...and if...you need them.

2. This book is organized in a way we've found works well. After chapter 1 (an introduction to MVS and TSO), the book is divided into 3 parts: one each on ISPF, TSO commands, and CLIST. So if ISPF isn't available at your installation, you can skip that part and concentrate on native TSO. If you already have TSO experience, you can go directly to the part on CLIST.

In other words, you can study the parts you want to, when you want to.

So why wait to become a TSO expert?

Get a copy of *MVS TSO* today. I think you'll be delighted at how quickly you'll master TSO.

Our unlimited guarantee

You must be satisfied. Our books must work for you, or you can send them back for a full refund...no matter how many you buy, no matter how long you've had them.

To order by phone, call 1-800-221-5528 / In Calif., call 1-800-221-5527
(Weekdays, 9 to 4 Pacific Std. Time)
When you call, please mention this ad code: T1/4

Practical texts on JCL and utilities

OS JCL teaches you how to code job-control language for everyday applications that involve sequential, direct, ISAM, or VSAM files. If you're a TSO user, this book will help you understand why you have to supply JCL for some TSO jobs and what that JCL should be.

Why take the time to write a program in a high-level language when you can use a utility program instead? *OS Utilities* teaches you to use 13 time-saving utilities, including IEBGENER, IEBPTPCH, IEBISAM, IEBUPDTE, IEFBR14, Sort/Merge, and IDCAMS.

Winnebago, Forest City travel down automation road

By Paul Korzeniowski
CW Staff

CW PHOTO BY PAUL KORZENIOWSKI

Winnebago Industries, Inc. manufactures recreational vehicles in rural Iowa.

FOREST CITY, Iowa — One probably would not expect to find a half-billion-dollar corporation in a city so rural that it lacks a fast-food franchise.

Neither would one anticipate that in-depth computer training programs would be run at high schools so tiny that each graduating class consists of fewer than 30 students.

But that is what one finds here in this town of 4,000 in northern Iowa, home to acres of cornfields and Winnebago Industries, Inc.

One cannot underestimate how important Winnebago is to this farm area. When times are good for the recreation vehicle manufacturer, which employs 2,500 workers, then good times come to Forest City residents.

Tough times at Winnebago

In the early 1980s, times were tough for Winnebago. New competition, unrealistic sales projections and unstable gasoline supplies and costs had turned a stream of steady profits into an $18 million river of red ink.

To stem the tide, major changes were made. John K. Hanson, the company's 71-year-old founder who had stepped away from an active role in the company in 1975, returned. With Hanson came an emphasis on automation, especially factory automation.

That new emphasis brought a corresponding increase in the use of corporate mainframes. The addition of product design and factory control applications had overloaded the company's IBM 4341 mainframe.

To ease the burden, an IBM 4381 was installed in the fall of 1984, and business applications such as a payroll system were off-loaded to it.

System still taxed

Despite the additional horsepower, the company is still taxing its systems. "Both mainframe systems are operating at full capacity, and we will have to upgrade them shortly," noted John Rieff, advanced technologies manager at Winnebago.

Part of the reason for the squeeze on its systems was that the company's business had once again begun to prosper. Hanson's leadership and a new line of smaller, lighter recreational vehicles helped to turn the business around.

Another reason for the increased automation was that, like other manufacturing companies, Winnebago has been exploring how computers can aid design, manufacturing and production processes. "When [General Motors Corp.] is ready to unveil its factory of the future, we want to be ready with ours," Hanson said.

Rieff is charged with realizing Hanson's vision, which has a target date of 1988. The advanced technologies manager is a member of a computer-integrated manufacturing (CIM) committee, whose job is to determine how Winnebago should automate its production processes.

"CIM is more than just [computer-aided design and manufacturing]" he said. "It incorporates concepts such as distributed processing so that corporate information can be spread throughout a company and used wherever it is needed."

CIM committee

The CIM committee consists of middle and upper level managers from a broad range of departments, including marketing and various Winnebago factories. Rieff will not have to school other members in computer fundamentals because three years ago Winnebago embarked on a comprehensive computer literacy program.

The program included computer literacy training classes for any employee interested in learning how the machines operate. The classes supplied a basic understanding of simple concepts such as input and output.

Also, a microcomputer learning center with a full-time in-house consultant was established. Employees can visit the center at any time. After they tell the consultant how they work, the consultant may recommend a package that the person can try out. If a user determines that a computer could help him do his job better, he or his manager can purchase it.

"There really isn't much of a risk," Hanson claimed. "It is only $5,000 and a company this size can afford to spend that amount of money without a guaranteed return."

The center supports equipment from various vendors including IBM, AT&T, Hewlett-Packard Co. and Apple Computer, Inc. "I think any employee should be able to work with whatever type of equipment he feels comfortable with," Hanson said.

Computer phobia held back execs

The only problem with the program was senior executive computer phobia. "I could not believe the resistance some of the senior managers had to working with the machines," Hanson claimed. "It took a real long time for them to overcome their fears."

Today, the microcomputers are primarily used in stand-alone fashion for typical spreadsheet and word processing applications. In order for CIM to become a reality, this data has to be integrated with other corporate information, according to Rieff. Consequently, the company has begun to look at some network alternatives.

In addition to productivity increases, Hanson saw another benefit to the campaign. Today, more microprocessors are used by the automobile industry to control engine activities than by the computer industry to control data processing. "When our engineers know how a microprocessor works, they may be able to incorporate them into the design of our products and save us money," he said.

Might we see a recreational vehicle equipped with a personal computer for someone who wants to take a spreadsheet on vacation? "Our customers tend to be older and are not very interested in vehicles equipped with microcomputers," Hanson said.

RYAN

from page 1

an MBA and learned the uses of technology in bank management positions. Ryan, on the other hand, is a mathematics major whose career has followed much more traditional data processing lines.

Ryan graduated from Providence College in Providence, R.I., and joined Datatrol, a software company in Washington, D.C., that was soon acquired by Control Data Corp. Starting out as a systems analyst at Datatrol, Ryan left CDC eight years later as manager of the Washington, D.C., office.

He joined Chase Manhattan in 1972 as a DP project manager. In those days, he said, a project manager "designed systems and wrote code, mostly in assembler language," along with everyone else.

In 1975, Ryan's responsibilities were enhanced to include securities data processing, and he proceeded through a succession of DP management posts during the next few years.

In banking, data processing is inextricably linked to bank operations, such as check processing or wire transfers, and in the process of supervising such operations, Ryan assumed general responsibility for the staff attached to it as well as the computer systems and personnel involved. In 1981, for example, when he became head of electronic data processing, Ryan also assumed responsibility for all Chase Manhattan clerical personnel devoted to check processing, securities and trust services and other operations.

Banking industry insiders note that Ryan's move from technical responsibility to supervision of a growth area of the bank might have been difficult for a more traditional MIS executive to make. Computer management and people management "have been intertwined throughout his career," said a Chase Manhattan observer.

Nevertheless, Ryan is an advocate of technology and thinks it holds the key to bank consumer services. "Technology is becoming dominant in the delivery of services. . . . It is the highway to get our product to the consumer," he said.

Whereas the branch bank was once the preferred delivery vehicle for financial services, the high overhead of bricks and mortar and the potential of electronic technology has now made automated services more attractive, Ryan said. Another factor in their appeal, he said, is that many bank customers actually prefer to deal with machines in some transactions.

As computers take over more of the routine tasks at a bank, the service people will be able to act more like salesmen and less like order takers, Ryan continued. In this context, the automatic teller machine, viewed by some as the epitome of impersonal service, actually frees staff to interact with customers as service and sales personnel.

The major banks have already installed the back-office computer services that clear checks and allow ATMs to process on-line transactions. Modern communications enable these services to extend their reach. When combined with the ability to organize information through data base management, the result "has been nothing short of extraordinary," Ryan said. But technology will play an increasingly direct role in consumer banking, he said.

One of Ryan's visions is of a day when banks place terminals in real estate brokers' offices, through which brokers can access listings of property for sale along with mortgage rates available from local banks. Such terminals, said Ryan, would be able to host programs that could analyze the borrowing limits of a house hunter, speeding his search and initiating the mortgage application process.

Ryan

The Chase executive believes that computerized home-banking services have a promising future independent of the questionable future of the home computer market. Chase declined to reveal the number of home-banking customers it serves, but it has the capacity to execute normal banking transactions as well as discount stock buying through Chase's subsidiary, Rose & Co., in Chicago. On this system, customers may view up-to-the-minute values of their portfolio and order trades to be executed the following day after regular trading hours.

With technical support, Chase can open small business loan offices or personal financial centers and staff them with sales people and minimal support personnel. It operates 13 business offices and two personal financial centers in the New York area. It also operates a mortgage office on Staten Island, N.Y.

Ryan also believes that it is only a matter of time before the courtesy cards that allow customers to access their accounts at ATMs begin to function as debit cards, usable at many retail stores. Instead of writing a check, a transaction would be routed electronically to the customer's bank and the amount deducted from his account. Such a step would be aided by emerging videodisk storage techniques that can store greater quantities of information and still make it available quickly.

"The amount of information that people want appears to be unlimited, but it is limited by cost and convenience," Ryan said. Consequently, Chase is turning to technology to help it provide information and service at a reasonable cost.

We'd like to get friendly with you.

The beauties above are two of the most user-friendly pieces in all of techdom. And both are backed by yet another dynamic duo: the sterling quality of Digital and the stalwart service of Leasametric.

The Digital VT220™ terminal, to begin, is the latest model in the cost-efficient VT200 series. This monochromatic model has a sleek look that's slick to use, including programmable function keys and a plain-language menu that's a snap to set up.

The LA210™ printer's no slouch, either. It's probably the most versatile printer ever produced by Digital. This multimode desktop is compatible with all Digital, IBM® and IBM-compatible personal computers. A friend to all, and pleasant to your purse as well: one machine for letter-quality printing, high-speed drafts, and high-resolution bit-map graphics.

All this, arm in arm with great service.

Not only can you get the pair right away from Leasametric — they arrive ready to work. Because we've put them through their paces before we ship them to you. Complete with operator's manuals, cables and the like. Plus, so good friends can keep in touch, we supply a toll-free number for on-line diagnostics. On-site maintenance if it's needed. And the iron-clad guarantee to replace — immediately — any piece that isn't up to snuff.

Finally, financing that's more than friendly. In addition to standard rental agreements, we offer volume pricing, rentals with options to buy, leasing and even used-equipment purchases.

Leasametric is an authorized distributor for Digital Equipment Corporation. We offer a full range of Digital's popular, quality terminal products. Why not call Leasametric today? After all, the best way to have a friend is to be one.

In California, call 800-528-6891. Outside California, call 800-228-6314.

Authorized Distributor

Rent the best from the best.

Greene OKs private-line switching by divested Bell firms

Decision permits rerouting onto long-distance circuits

WASHINGTON, D.C. — U.S. District Judge Harold Greene recently declared that the regional holding companies can provide switching services at their exchanges for private-line customers who want to route local calls onto long-distance circuits. The decision gives the divested Bell operating companies clearance to configure private networks that service multiple exchanges while keeping them out of the long-distance business.

Greene said it was permissible for Pacific Northwest Bell Telephone Co. to carry out a reconfiguration of the state of Oregon's private intrastate multiexchange network where three nodes were established that were able not only to switch local calls but to switch local calls onto long-distance circuits.

While Greene's decision is being viewed by the U.S. Department of Justice, which oversees the enforcement of the AT&T divestiture decree, as specifically pertaining to the Pacific Northwest Bell case, other observers say the court order could spark new efforts by the divested Bell operating companies to play a larger role in the configuration of networked communications across exchange boundaries, especially for large-volume corporate users.

Bell Atlantic Corp. said, "The decision . . . enhances our ability to compete for large customers as long as we don't provide interexchange circuits." Bell Atlantic noted that it is currently seeking to provide a similar network configuration service to the state of Virginia.

Richard M. Wolf, executive vice-president of Robert E. LaBlanc Associates, a Ridgewood, N.J., telecommunications consulting firm, said the Greene decision "represents a clear softening of the interexchange prohibition demarcation line" for the divested Bell operating companies contained in the original divestiture decree. However, he cautioned that the effect of the Pacific Northwest Bell decision will be limited and represents Greene's approval of a state government as opposed to a commercial interest obtaining a similar configuration.

"I do think, however, that intrastate interexchange switching is going to be the area most prone to pressure for change. Here, state utility commissions have jurisdiction and a federal-state issue is presented," he added. AT&T petitioned Greene to test the legality of Pacific Northwest Bell's service, alleging that it was offering an interexchange long-distance service in violation of the divestiture decree and also was engaged in discriminatory pricing by giving lower local rates to private-line customers than to long-distance carriers.

In rejecting the AT&T petition, Greene noted that the divestiture decree forbids the former Bell operating companies from performing interexchange or long-distance routing to particular long-distance carriers, but it does not prohibit them from providing switching services to customers as end users when they want to originate or terminate traffic from dedicated private or tie lines that connect to interexchange circuits as part of a Centrex offering or a private branch exchange (PBX) service.

Greene noted, "Indeed if the [former Bell operating companies] were precluded from providing such services, they would be foreclosed from a substantial portion of the end-user switching and private-line network markets which they currently serve."

Greene said that in the case of Pacific Northwest Bell, the company switched the state of Oregon's interexchange private-line calls onto the private interexchange transmission facilities that were being provided by AT&T at its points of interface. The state switched the remaining calls using on-premise PBX equipment.

Greene said that marketing and engineering functions performed by Pacific Northwest Bell consisted of estimating the number of interexchange circuits the state would need to connect two intraexchange nets, which he said was "an inherent and necessary part of its authorized businesses of providing the intraexchange portion of the customer's private network and of marketing Centrex- and PBX-based private- switching systems and services."

Pacific Northwest Bell did not select the long-distance carrier to be used by the state to connect the nets but rather programmed its Centrex switches to establish connections with AT&T Communications circuits that were picked by the state's planning officials.

Greene rejected the AT&T charge of discrimination in local exchange pricing for the same service, even though rates for carrier access were higher than for private network access. He upheld Pacific Northwest Bell's contention that carrier access pricing, unlike local private-line rates, was meant to support local service.

While the Justice Department argued that Pacific Northwest Bell's service was legal, it pointed out that it believed the divested Bell operating companies are prohibited from "designing routing algorithms for tandem routing of interexchange traffic, the selection or recommendation of the long-distance carrier and the procurement for customers of interexchange service from the interexchange carrier."

OEM Computer Product Buyers

"The Invitational Computer Conferences bring to you the latest high-tech information you need to hear, and the major OEM products you need to see. We'll be there!"

And you'll find other top OEM manufacturers, such as NCR, Fujitsu, Xebec, Lear Siegler, Siemens and IBM, to name but a few.

Celebrating its 15th year, the "OEM Only" ICCs bring you, the volume buying decision makers, together with the key suppliers of computer and peripheral products. The ICCs also bring you a full day of high-tech seminars, explaining the latest in computer product technologies and what they mean to you, the systems design engineer. As an invited guest, there is no charge to attend the seminars or product displays.

The ICCs, a series of eleven, one-day regional conferences are convenient to where you work. The small, exclusive setting makes it easy for you to meet potential suppliers one-on-one.

Hear what the OEM manufacturers have to say, learn about new technologies, and remember, you may attend "by invitation only."

Darpa fuels supercomputing

GAITHERSBURG, Md. — A new generation of supercomputers is being born across the U.S., sponsored by money from Uncle Sam.

Already, a new large-scale multiprocessor machine — called the Butterfly Multiprocessor — is up and running and is available for access by researchers who have hookups to the U.S. Department of Defense's Arpanet system. It was designed and manufactured by Bolt Beranek & Newman, Inc. of Cambridge, Mass. The sponsorship of the new generation of supercomputers is being directed by the Defense Advanced Research Projects Agency's (Darpa) Strategic Computing Initiative at a cost, to date, of $150 million. The goal of the project is to develop advanced machine-intelligence technology during the next 10 years.

In addition to a new generation of supercomputers, other research areas being supported by Darpa include software applications generators to promote AI systems for speech recognition, natural language computer interfaces, vision comprehension systems and advanced expert systems.

The Butterfly machine is the first product to emerge from the Strategic Computing Initiative based on a multiprocessor architecture. In this case, a variable number of processors can be incorporated into the machine, accommodating up to 128 commercially available microprocessors (Motorola, Inc.'s 68000 series). Each processor has access to .5M bytes of memory and the top machine speed is quoted at 200 million instructions per second (Mips).

Bolt Beranek & Newman currently has government commitments of up to $20 million to build 10 of the Butterfly machines.

A second supercomputer, being developed at Carnegie-Mellon University in Pittsburgh, is a programmable systolic array. The system consists of a configuration of multiple processing elements that is slated to run at a rate of 10 Mips.

A third supercomputer that will be completed this year with support from Darpa is the Connection Machine, manufactured by Thinking Machines Corp., Cambridge, Mass., which will contain 64,000 processors that are connected to each other.

The initial 64,000-node processor machines will be manufactured using very large-scale integration technology of 10,000 gate array chips, each containing 16 processor elements to connect to other surrounding nodes, as well as a communications router, according to the vendor.

The Connection Machine will be directed by a computer at the front end that will instruct the machine on the task to perform at rates potentially as high as 10 billion instructions per second.

The fourth and final supercomputer project being supported by Darpa's Strategic Computing Initiative is under way at Columbia University in New York, where researchers have designed and built a non-von Neuman machine based on a tree architecture that combines up to 8,000 large and small processors. The machine is functionally similar to the Connection Machine.

[illegible]

Ramblings from the floor of Cincom Systems, Inc.'s Directions '85 Executive Management Conference:

■ It may be because of the joint marketing agreement Cincom recently penned with Digital Equipment Corp., but for whatever reason the Cincinnati-based software vendor made DEC representatives feel right at home at its Directions '85 Conference last week.

Two Cincom speakers took time from their presentations to point out that most of the initial development work for the company's IBM mainframe and DEC VAX-compatible software was done on VAX processors. Other representatives, including Chairman and Chief Executive Officer Thomas Nies, described benchmark tests conducted by Cincom that they said illustrated the price/performance superiority of the VAX compared with two classes of IBM mainframes.

Nies also gave attendees a brief history lesson on IBM's introduction of its OS and DOS operating systems, both of which he described as primarily batch oriented.

Nies said the fact that OS and DOS were not designed for on-line environments "was a little error in the beginning that became a big problem over time." Nies labeled DEC's VMS, which he said was designed as an interactive operating system, a product of "modern thinking."

CW AT DIRECTIONS '85

Another Cincom speaker claimed that "many of the links between IBM processors are weak." On the other hand, he told visitors, DEC has been successful in ensuring compatibility among its processors, everything from the VAX 8600 to the Microvax.

■ Asked whether IBM would introduce an operating system successor to MVS/XA later in this decade, Ron Weeks, senior product manager of architecture and business planning, said such an announcement would depend on what Big Blue's competition has up its sleeve. "IBM does what its customers want," he said, "but only as fast as the competition pushes it. IBM's solutions are longer term. If you can wait, that's okay."

■ As an aside, Nies said IBM offered to sell the CMS component of its increasingly popular VM/CMS operating system to Cincom some 10 years ago for $2.5 million. Nies said he declined the offer because "I didn't think we could sell an operating system."

■ John Carpenter, corporate technical consultant with Cincom, told visitors that end users will have to become more involved in applications development. "We can't move far enough ahead, fast enough, without greater user involvement," he said. "We don't have enough programmers to automate all the functions that need to be automated."

■ Comments made by a Cincom spokeswoman indicated that the company was less than thrilled with the recent National Computer Conference (NCC) attendance. She said the show garnered Cincom about 300 prospects, a smaller group of potential customers than Cincom won at last year's Las Vegas show. However, the figure was not low enough to cause Cincom to consider withdrawing from NCC participation, the spokeswoman said.

Aging systems nag managers

CW AT DIRECTIONS '85

By John Gallant
CW Staff

NEW SEABURY, Mass. — Picture the DP manager as a long-distance runner. Striding toward the goal of providing information that a company needs to survive, the DP manager must dodge the obstacles tossed up by "technological earthquakes" — the rapid and often incompatible advances in computer and communications technology — according to Ron Weeks, senior product manager of architecture and business planning at Cincom Systems, Inc.

The long-distance DP runner must also carry the millstone of obsolete methods and aging applications.

Weeks was not the only Cincom speaker to draw on the millstone analogy at the company's Directions '85 Executive Management Conference here last week. Thomas Nies, Cincom's chairman and chief executive officer, also claimed that reliance on older technology — especially software — and outmoded approaches to information management are inhibiting advances in MIS.

"The large investment in old software makes it tough to move forward," Nies said. "You cannot drag the old along and hope to make great progress. Advances in software have tended to be evolutionary, while breakthroughs in hardware have been revolutionary. Thus, there is an increasingly large gap between the

See CINCOM page 15

[illegible]

Last May, when Apple Computer, Inc. announced that Steven Jobs would assume "a more global role" in the reorganized company's operations, the firm probably had no idea how apt its choice of words would become.

At the time, Apple was consciously engaging in euphemism. Since then, however, Apple's memorable exercise in double-talk has taken on new meaning.

As the San Jose, Calif., *Mercury* recently reported in a front-page news story, Jobs now wants to become an astronaut. Yes, the wunderkind who pioneered the microcomputer industry and became a prototypical American success story has signed up for a program that gives a select handful of civilians the opportunity to tag along on future space shuttle missions.

In all probability, Jobs' bid to become the first counterculture entrepreneur in outer space will end in disappointment. Only a tiny fraction of the program's horde of eager applicants will ever realize their dreams of roaring off into the yonder.

But if good fortune smiles on Jobs and his application for a space shuttle seat is accepted, his position may someday become infinitely more global than Apple ever imagined.

Jobs' desire to join the space shuttle crew seems an unusual career move. But under the circumstances, his aerospace aspirations are understandable.

Here, after all, is a man who, probably more than anyone else, popularized personal computers, built Apple into a Silicon Valley legend and made himself a millionaire many times over before he turned 30. Then, in one fell swoop, he saw himself unceremoniously stripped of all his day-to-day management duties and reduced to being a figurehead. To add insult to injury, his demotion became fodder for nationwide news coverage and was engineered by an executive he himself had helped recruit.

Compared with the woes that have recently befallen him on terra firma, the perils that await him in the frigid but tranquil void of outer space look positively piddling. Who could blame him for gazing longingly at the spacecraft *Challenger*?

Jobs, of course, is by no means the only one who suffers in the industry these days. Suppose for a moment that the travel agency at Cape Canaveral chartered a special space shuttle excursion just for the benefit of harried members of the computing field. Who or what organizations should be included? A suggested list of passengers follows:

■ IBM President John Akers. Having originally predicted improved earnings for the company in 1985, Akers later found himself in the uncomfortable position of retracting his earlier statement and announcing the industry giant's first quarterly downturn since God knows when. One nagging question about Akers' space shuttle participation still lingers, however. As a concession to IBM, will mission organizers be willing to issue dark, three-piece space suits with pin stripes?

■ Apple President John Sculley. Although he has effectively rid himself of the bothersome Jobs, Sculley still faces the unenviable task of leading his firm into battle against Big Blue on its own home turf. Red ink and postreorganization tumult also qualify Sculley for an outer space getaway. But if Apple's recent past is any guide to its future, Sculley will arrive at the launching pad only to find that all the space shuttle seats are already occupied by IBM staff.

■ The Internal Revenue Service. A collection of new IRS computer systems that were supposed to speed the processing of this year's tax returns had the opposite effect. An unusually large number of refund checks were significantly delayed. But even if the modified systems had worked perfectly, the IRS would probably win a place on the space shuttle by acclaim. Most taxpayers would probably rejoice at the thought of hurling their revenue agents at warp speeds in the direction of Alpha Centauri.

BDPA meet slated

PHILADELPHIA — The Black Data Processing Associates (BDPA) has scheduled its seventh national convention for Sept. 20 and 21 at the Franklin Plaza Hotel here.

The conference will include seminars and exhibits from a number of vendors. Some of the sessions topics include data base strategies, local-area networks, an introduction to AT&T Unix and artificial intelligence. .The keynote speaker will be Carl Singley, dean at Temple University's school of law.

The convention costs $210 for BDPA members and $225 for nonmembers.

More information is available from BDPA National Convention, P.O. Box 7466, Philadelphia, Pa. 19101.

IBM Security

In 4 Days

The 5th Annual Conference on Control & Security of IBM Systems

This conference offers you the opportunity to learn how to secure IBM systems. You will be able to master new techniques and refine current methods to gain full control of large and small systems, existing hardware and software and the latest innovations.

Nine full-day tutorials covering MVS. VM. IMS. CICS. SNA. Local Area Networks. 4th Generation Languages. UNIX. and Data Security.

Ten half-day sessions covering ACF2. RACF. TOP SECRET. VSAM. Networks. ROSCOE. DB2. SMF. Risk Analysis. and Microcomputer Control & Security.

Thirty five technical sessions. as well as keynote speakers and special features.

September 30 - October 3, 1985

The Solution.

Dial-Up 3270

LineMaster An intelligent device for dial-in access to your mainframe 3270 Bisync line.

LineMaster is a communications watchdog which keeps a line in service until a user dials in.

- For any remote 3271/4/6 line—up to 19.2K baud.
- Compatible with any 3270 BiSync emulator including microcomputers.
- Connects between modem and mainframe.
- Installs in minutes.

Four-part approach seen key to integrated applications

CW AT DIRECTIONS '85

By John Gallant
CW Staff

NEW SEABURY, Mass. — MIS managers must ensure that four key software components are in place if they want to provide users with a completely integrated applications portfolio.

At the heart of such a portfolio, according to Thomas Womeldorff, senior product manager for Cincom Systems, Inc., is a data base management system (DBMS) that provides a common data resource for all applications and network management tools that allow data to be shared among processing environments within a company.

Speaking at Cincom's Directions '85 Executive Management Conference here, Womeldorff said a second vital component is a set of applications for what he labeled "predictable" business functions, such as general ledger or order entry. Supplementing those standard applications, he said, is a fourth-generation language that allows an MIS department to build systems for unique needs or to customize vendor-supplied packages.

The final component, Womeldorff said, includes data retrieval and decision support tools for meeting unpredictable information needs.

According to Womeldorff, such a portfolio offers the following three levels of integration:

- Data integration, which ensures that "a single definition of all corporate information is viewed and updated by all business events or activities."
- Transactional integration, which means that a single transaction is used to record an event. The transaction — for example, the entry of a customer's order — updates operational records, such as inventory, feeds financial tracking systems and triggers feedback to planning systems.
- Operational integration, which Womeldorff described as a single menu and security system and a standard screen design that allows users to initiate transactions easily and move between applications.

"The quality of a company is more and more related to the quality of its planning, operational and financial tracking systems, all of which must be linked to ensure that information flows swiftly throughout," Womeldorff said.

Despite the obvious benefits of such integration, he said, very few companies have all the components in place. Why?

"The cost and difficulty of developing an integrated applications portfolio in-house are prohibitive," he said. "You would essentially be building one huge application. That is a job that has outgrown virtually every company.

"Also, many applications vendors have specialized in specific areas and do not support a full spectrum of packages. Even within one vendor's line, packages are not completely integrated.

"It seems so logical to have integrated applications," Womeldorff continued. "Some smaller companies just starting out can build a portfolio more easily. But larger companies with older applications in place find it very hard to do. It is a long-term project that requires you to consider applications on a companywide basis."

CINCOM

from page 13

capabilities of software and the growing potential of hardware.

As an example, Nies said that roughly 85% of users are still using Cobol. "Cobol was born in the late 1950s when they still made DeSotos and vacuum tube computers. Today, the programmers are younger than the languages they use," he said.

But Nies, whose company is one of the leading vendors of systems software and an important player in the applications market, laid the blame for sluggish advances in MIS not on users, but on software vendors.

"Vendors are interested in account control, locking customers into their systems. "It is not the customer's fault," he said. "It is the vendor's fault."

Nies warned that locking in users also locks in vendors — a point that Weeks addressed. "We are witnessing a spreading out of applications to all levels in a company," he said. "The trick is to move data and processing [functions] between a variety of systems. Success will come when users can decide what is the most optimal use of resources.

"The only way hardware and software vendors can sell more products is to help users reach that goal," Weeks concluded.

The key, Nies and Weeks said, is for vendors to provide software that is insulated from its environment and provide the tools users need to exploit and integrate new technologies. The biggest obstacles, Nies said, are "the idea that things should be done the way they always have and . . . the entrenched power groups who block technological advances."

Learn how to manage end-user computing... from the people who know how to manage.

Chances are, end-user computing has brought new management challenges to your company. That's why IBM is offering classes that deal with issues such as: Which applications are best for your end users? What companywide strategies should be implemented to deal with personal computing? How can your return on investment be measured?

To learn management approaches that deal with these issues and more, consider attending the following courses at the IBM Information Systems Management Institute:

Information Center Management
—Course code W9948
Information Center Consulting
—Course code W9949
Managing Personal Computing
—Course code W9944
Planning for Office Systems
—Course code W9920
Project Planning & Control for Users
—Course code W9896

For 19 years the IBM Information Systems Management Institute has offered low-cost classroom courses to help customers increase the productivity of their information systems.

The Institute's 36 courses are grouped into six areas considered to be critical success factors for I/S operations: Information Systems Planning; Application Development; Service Management; Information Asset Protection; End-User and Personal Computing; and Professional and Management Development.

Experienced instructors teach the same techniques that IBM itself uses. What's more, classes are conveniently offered in over 20 cities.

To help you find out more about the Institute's curriculum, and each specific course, we have recorded complete descriptions on audiotape.

To listen to these tapes, to order a course catalog, or to enroll—call the number below.

IBM wins FAA job for CPU replacement

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — The Federal Aviation Administration (FAA) recently awarded IBM a contract with a potential value of $432 million to replace the existing IBM 9020 mainframes at 20 air-traffic control centers.

The replacements will be IBM 3083 Model BX1 units, with each installation consisting of a primary processor with a backup unit, FAA officials said.

IBM was awarded the contract following a 21-month design competition with Sperry Corp. According to the FAA, the selection was based on cost and performance factors, including the results of a "compute off" between the two candidate systems at the FAA Technical Center near Atlantic City. A key factor in the evaluation was the ability of the IBM system to host the current 9020 software package with minimal modifications, officials said.

Award made despite criticism

The contract award was made despite criticism from the U.S. General Accounting Office that the FAA tests were insufficient because they did not simulate the heavy work load expected in the late 1980s.

FAA officials said the IBM 9020s, installed in the early 1970s, must be replaced because they lack the storage capacity and processing power to handle the increasing volume of air traffic in the U.S.

Furthermore, according to Secretary of Transportation Elizabeth Dole, "the new computer will have the capacity to assume added functions — such as improved conflict detection and resolution — permitting the FAA to make more efficient use of controllers."

Options could increase value of contract

Dole said the basic value of the contract is $196.9 million, but options for future hardware maintenance, software and technical support could increase the value of the contract by an additional $235.1 million.

The contract calls for IBM to deliver the systems to the air-traffic control centers over a one-year period, beginning next summer. Similar units will be delivered to FAA technical centers to use for training purposes.

The FAA expects to use the IBM mainframes until about 1990, when it plans to install an advanced generation of computers for air-traffic control. IBM and Hughes Aircraft Co. are now engaged in a three-year design competition for the Advanced Automation System [CW, Sept. 3].

The IBM 3083 systems will provide "a stable transition vehicle to our advanced automation program in the future," Dole said.

TIRED OF BEING DUMPED ON?

LEARN HOW TO SOLVE THE TOUGHEST CICS INTERNALS PROBLEMS.

SysEd's CICS Internal Architecture course is for systems programmers and others who are up to their eyebrows in the toughest kind of programming, debugging, performance and recovery problems.

This demanding course eliminates the mystery surrounding the internal workings of CICS so that students have the knowledge and skills they need to approach both transactions and systems dumps confidently, and handle performance and application design problems in an organized, informed manner. There is no other source for this kind of in-depth training . . . *anywhere*.

SysEd's Internals courses are held weekly at our computer training centers in New York City, Chicago and San Francisco—or at your own location. Special weekend courses for consultants are available.

For information, call Dave Shapiro (212) 564-9147 48 49.

WASHINGTON UPDATE
CW Washington Bureau

GAO maintains firm misled SSA

WASHINGTON, D.C. — The U.S. General Accounting Office (GAO) recently reaffirmed its contention that Paradyne Corp. misled the Social Security Administration (SSA) about the status and availability of data communications equipment that it demonstrated in 1980 to win a $118 million contract.

The GAO was asked by U.S. Rep. Jack Brooks (D-Texas), chairman of the House Committee on Government Operations, to review two affidavits that Paradyne submitted to fight a government proposal to bar Paradyne from obtaining future contracts [CW, March 18].

The affidavits, submitted by George Whit Dodson, a retired government procurement official, and Joseph M. Fox, a former IBM official, asserted that Paradyne did not mislead the SSA in its proposals or equipment demonstrations [CW, April 22].

Dodson's affidavit said that it is a common practice in the computer industry to use the present tense to describe products that are not yet available. The GAO disagreed and said the SSA bid request specifically sought hardware that is "available to the general user."

Referring to the fact that Paradyne demonstrated a Digital Equipment Corp. PDP-11 processor instead of the Zilog, Inc. Z8000 processor proposed in its bid documents, Dodson and Fox said the processors had the same functional capabilities. The GAO auditors said that although both are 16-bit processors, in almost every other technical respect, they are dissimilar.

Worldwide DP system hits snags

WASHINGTON, D.C. — The U.S. Department of State is having some problems with the installation of its worldwide distributed data processing system for financial management, according to a review by the U.S. General Accounting Office (GAO).

A recent GAO report cited the following difficulties:

- Air-conditioning and air pollution problems interfered with installation of a minicomputer at the Cairo site for several months. Also, the center at Abidjan, Ivory Coast, has experienced serious electrical failures.
- Systems managers in Bangkok, Thailand; Brasilia; New Delhi; Cairo; and other sites reported difficulties in getting timely maintenance services.
- The State Department has experienced delays in installing high-speed data communications lines for a variety of reasons, including the fact that facilities in some lesser developed countries are not suited for high-speed communications.

The GAO report said the State Department is well aware of the problems and is taking action to overcome them.

Audit finds DP center lacking

WASHINGTON, D.C. — The U.S. Department of Agriculture's National Finance Center in New Orleans, which provides financial DP services for the agency, needs to improve the security and reliability of its DP operations, according to a government audit.

In a recent report, the U.S. General Accounting Office (GAO) said the DP center lacked a formal disaster recovery plan and had outdated and incomplete software documentation that hindered system maintenance.

Furthermore, the GAO's report said, software changes were not independently tested nor reviewed for integrity, and some personnel had access to both the data files and the financial programs, raising privacy and security concerns.

U.S. Department of Agriculture officials reported that steps have been taken or are planned to address the GAO findings, but all of the necessary actions have not yet been completed.

WORLD DIGEST
CW International News Network

TOKYO — Hitachi Ltd. announced last week a $120 million dollar program to purchase equipment immediately in the U.S. in response to Japan's heralded "Action Program," which is intended to rectify the U.S. trade imbalance. The company said this money would be in addition to the approximately $200 million it already spends annually on American products.

At a press conference held in Washington, D.C., Executive Managing Director Toshi Kitamura also announced an increase of Hitachi investments in the U.S. for the next year, with the opening of additional manufacturing plants. Also announced was the Hitachi Foundation, an endowment of $20 million earmarked for "continuing and expanding the company's support of joint educational research projects, scholarships, cultural and charitable programs in the U.S."

A 10-member import promotion team will arrive in the U.S. in August with orders to promote purchasing arrangements with U.S. companies. Four areas have been targeted for the purchase agreements: production facilities and equipment, research and development equipment, more long-term purchase contracts for U.S.-made semiconductors and long-term purchase contracts for U.S.-made communications equipment. A Washington, D.C.-based corporate affairs office will also be established, a Hitachi spokesman said.

TOKYO — NEC Corp. will act as the Japanese distributor of General Electric Information Services Co.'s (Geisco) worldwide teleprocessing services here, according to an announcement made last week. NEC's clients in Japan will be able to obtain teleprocessing services provided by Geisco's international network as of Oct. 1, according to a spokeswoman. The interconnection of Geisco's service with NEC's own Japanese value-added network will significantly expand business opportunities for both companies, NEC added.

[illegible], *Australia* — A market research firm here has predicted that IBM will manufacture Caironet's AT&T Unix-based multiprocessor microcomputer, Micronode, here for worldwide sales. The move is an effort to counter sales of Digital Equipment Corp.'s Microvax II technical workstation, according to a report by the Yankee Group.

Two weeks ago, Caironet announced a deal with the Sydney software house of Neology Ltd., which was to port Unix onto the Micronode. At the time, Caironet said it was negotiating with a "multinational computer company that had manufacturing facilities in Australia" to produce the Micronode here. Meanwhile, an IBM product, code-named Quicksilver, believed to be the Micronode, is due to be announced soon. The Yankee Group report claims that since DEC's Microvax II was released last May, IBM has faced increased pressure to show its hand in the market for technical workstations.

CANBERRA, *Australia* — Australia's international promise to look at developing long-term copyright protection for computer software might not be kept, a senior public servant has warned.

The pledge was made not only in the Parliament but also before a United Nations body specifically convened to consider software copyright at international levels. Sources in the attorney general's department here believe that the international community is not close to a consensus and called ordinary copyright laws acceptable, if not ideal, for the protection of software. It is thought that Australia will soon merely amend current copyright laws to cover computer programs, just as the U.K., France and West Germany have done this year.

PERTH, *Australia* — Claiming that there are no Australian consultants with expertise in integrated mining systems, Alcoa Ltd. has employed French contractors to set up a mainframe recently ordered from National Advanced Systems, Inc. (NAS). The 16-channel NAS 9060 with 24M bytes of main memory scheduled for delivery in September will replace an IBM 3033N.

Like the IBM 3033N, the NAS mainframe will run in parallel with a second IBM 3033U.

The parallel configuration supports a 400-terminal network encompassing three refineries and four mine sites in Western Australia, as well as three Victorian facilities.

SYDNEY, *Australia* — Criminals thinking that they may have pulled off successful capers in the past have cause to worry. The New South Wales Police Department purchased a $5.7 million system that matches fingerprints at a rate of 2,310 prints per second and successfully matches partial prints with accuracy previously unobtainable, a police spokesman said. The order for the automated fingerprint system went to NEC Information Systems Australia Pty. Ltd., which won the bid over three other vendors on the basis of speed, optical disk capacity and applications software. NEC has supplied similar systems to police departments in California, Alaska and Japan, but this is said to be the company's first Australian mainframe order.

How can they understand your product if they can't understand your language?

Try responding effectively to the Japanese text above. Without knowing Japanese.

It's the same problem for your clients abroad who may not be able to decipher your language.

That's where computer-aided translation (CAT) systems and services from Weidner Communications Corporation (WCC) can help. Whether you need to translate 5,000 words or 500,000. In *Japanese. French. Spanish. German. Italian* and *Portuguese.*

Our MicroCat single-user system lets your personal computer translate up to 1800 or more words per hour. Accurately and cost-effectively.

To support multi-users and heavier work loads, MacroCat does the same remarkable job. Only at even faster speeds of up to 8,000 words per hour.

Or, when you'd rather not do it yourself, our Translation Service Bureau combines state-of-the-art technology with native-speaker expertise to give you precise translations. Fast.

Very simply, with WCC you'll sell more in the global market—because you'll communicate more. And that makes a lot of sense in *any* language.

ONCE BELKNAP CHOSE AT&T, OUR HARDWARE COULD START MOVING THEIRS.

For nearly 150 years, Belknap has supplied quality hardware to retailers in twenty-five states. Now they've set their sights on the other twenty-five, and once again they're relying on quality hardware to help them get there—the kind supplied by AT&T.

The New Belknap has developed a totally automated end-to-end distribution system—the only one of its kind. The nuts and bolts of the system are the AT&T UNIX™ PC and 3B family of computers, a hand-held data terminal called the PDE 400, and our Enhanced Network Services to keep information flowing between retail stores and distribution centers.

Belknap will be able to serve their customers as never before. Inventories can be monitored from moment to moment, and orders placed electronically to keep retailers in stock. Sophisticated financial reports will give them up-to-the-minute accounts of their profit margins, cost of goods sold, and other critical information to help them better manage their business.

Only AT&T could provide the complete system to launch the New Belknap on a national scale. Because all our products can grow and expand right along with them, they're ready now to meet future needs and demands that may arise.

Add to that AT&T's unparalleled national sales and service network, and it's clear that when the New Belknap chose AT&T, they hit the nail right on the head.

To find out why AT&T is the right choice to help your business meet its long-term needs and goals, call your Information Systems Account Executive or 1 800 247-1212, Ext. 538.

Mini vendors poise for change

Recent financial reports dramatically prove that, with a few exceptions, minicomputer vendors are shouldering the brunt of the sudden decline in computer equipment sales. If the slump extends beyond this year, the minicomputer industry may find itself undergoing a drastic restructuring rivaling the infamous microcomputer shakeout.

The mini vendors, meanwhile, are betting that the situation is a mere cyclical correction that will run its course by the end of the year. But that is just what semiconductor manufacturers were saying at this point last year, and just recently, two of their number — Intel Corp. and Texas Instruments, Inc. — warned that the chip industry is in its worst recession since 1974, with no end in sight.

The problems of mini vendors Data General Corp. and Wang Laboratories, Inc., which seem to be spreading to other vendors, probably do not quite parallel those of either the chip manufacturers or micro vendors.

In the personal computer wars, history proved that it was suicidal for vendors to ignore standards — witness Gavilan Computer Corp. and Otrona Advanced Systems, Inc. But it also proved that mere adoption of a standard was insufficient to guarantee success.

In the chip industry, commodity pricing and excess capacity acted as pincers when helter-skelter demand suddenly dried up, and customers found they had more than enough products to absorb.

Where once DEC had the dominant role in scientific and engineering applications and where Wang was king of the office typing pool, now there is competition from IBM on one side and a host of commodity manufacturers on the other.

The alternative to emulating DEC and IBM seems to promise pitfalls that mirror the woes of the chip industry. There is a host of firms offering similar versions of minicomputers using Motorola 68000 series microprocessors and AT&T's Unix operating system.

As such systems proliferate, users can pretty much base their shopping decisions solely on price, with the result that the vendors sell into a commodity market that cannot support more than a few low-cost producers.

Unlike the Personal Computer look-alike industry, minicomputer vendors have not been sitting still. DG was able to grab market share with its MV/10000. DEC hopes to regain momentum with the VAX 8600 on one end and the Microvax II on the other. Some younger companies are betting that the relatively middle-aged mini vendors are too big and cumbersome to catch the next wave of technology. With the arrival of Alliant and Encore and others comes a variety of multiprocessing and parallel processing alternatives that promise to offer solutions that can't be filled by general-purpose machines.

It seems that the mini industry is poised at the trunk of three branching alternatives. Will users select the commodity option that seems certain to wreak savage disruption; will they stick with the tried-and-true vendors and continue to press for greater communication with IBM mainframes; or will they bet on upstarts promising breakthroughs?

One year ago, we would have thought there would be time and money to provide some coexistence of the alternatives. Today, it seems that economic factors are forcing vendors into a make-or-break situation. If the sales slump continues, a severe shake-up seems inevitable, particularly if worried users decide that IBM provides the most stable choice.

Certification for professional pride

In response to your article "Hiring execs don't see ICCP certification as critical asset" [CW, June 24], the writer forgot to mention how nonexecutive data processors feel about certification. Certification is a personal achievement for most professionals.

Our field, although no longer in its infancy, is still trying to carve out a place among the professions. Accountants, engineers, doctors, nurses, lawyers, teachers, insurance agents, to name a few, can be certified in some fashion, and most require further education to be certified. In some cases, their certification is a requirement for employment; in other cases, it is a title that goes with professional pride.

By 1990, surveys report that there will be a work force of 500,000 analysts in the DP profession. Currently, there are approximately 300,000 analysts of which 30,000, or 10%, are certified. The Certificate for Systems Professionals (CSP), first to require recertification, has approximately 7,000 holders.

Those in the industry have indicated that recertification through continued education keeps the profession up-to-date.

The CSP is a step in that direction. All CSP holders are required to have 120 hours of continuing education during a three-year period to retain their certificate. Soon, the remaining types of DP certification will follow suit.

Computerworld is a member of the CW Communications/Inc. group, the world's largest publisher of computer-related information. The group publishes 58 computer publications in more than 20 major countries. Nine million people read one or more of the group's publications each month. Members of the group include: Argentina's Computerworld/Argentina; Asia's The Asian Computerworld; Australia's Computerworld Australia, Australian PC World and Macworld; Brazil's DataNews, MicroMundo, and PC Mundo; China's China Computerworld; Denmark's Computerworld/Danmark, PC World and Run (Commodore); Finland's Mikro; France's Le Monde Informatique, Golden (Apple), OPC (IBM) and Distributique; Germany's Computerwoche, Microcomputerwelt, PC Welt, Softwaremarkt, CW Edition/Seminar, Computer Business, Run and Apple's; Italy's Computerworld Italia and PC Magazine; Japan's Computerworld Japan; Mexico's Computerworld/Mexico and Compumundo; The Netherland's Computerworld Benelux and PC World Benelux; Norway's Computerworld Norge and PC Mikrodata; Saudi Arabia's Saudi Computerworld; Spain's Computerworld Espana, PC World and Commodore World; Sweden's ComputerSweden, Mikrodatorn, and Svenska PC; the UK's Computer Management, Computer News, PC Business World, and Computer Business Europe; Venezuela's Computerworld Venezuela; the U.S. Computerworld, Hot CoCo, inCider, Infoworld, MacWorld, Micro Marketworld, PC World, Run, 73 Magazine, 80 Micro, Focus Publications and On Communications.

VIEWPOINT

Where are the emperor's new clothes?

WOHL STREET MINIJOURNAL
Amy Wohl

You remember the parable of the emperor's new clothes: Dishonest tailors clothed the emperor in invisible garments and cunningly convinced him they were of the finest and sheerest cloth. The naked emperor paraded through the streets of his kingdom and none — save a very honest young lad — dared tell the truth.

But what does it mean when the emperor insists he is naked, while his courtiers and scribes insist they see his new clothes? For months now, the press has been full of tales of IBM's imminent announcement of a personal computer. "Any day now," stories say, "here is what it looks like," they proclaim. "Wrong time to buy old stuff."

And there's the problem. Suddenly, personal computer sales, IBM's and others, seemed to slip. Especially skittish were the big users. Who wants to get stuck with a thousand slightly out-of-date new machines?

Enter IBM. "Stop the rumors," they say. "There is no PC2. So don't sit around waiting for an imaginary machine to appear, buy some Personal Computers today." Well . . .

Let's look at the facts. IBM's Personal Computer is not exactly a new product. In fact, it is not a product at all but rather a family of products, more or less compatible, embodying a range of related technologies and capable of significant and continuing enhancement before a noncompatible machine would have to occur.

And there are marketplace facts to consider. No one, no matter how much technology they have stuffed into a microcomputer product, has successfully outrun IBM since its announcement of the original Personal Computer in 1981. They can try to be bigger, smarter, faster or more exciting, but users will still want it to be Personal Computer compatible. The more they buy Personal Computers, the more they need to care about the compatibility of new products with their growing installed base.

So IBM holds most of the cards. As long as it doesn't change the rules of the game by creating a new machine with new kinds of compatibilities, it is unlikely that any noncompatible challenger can pose a serious threat.

IBM customers greeting PC2 with open arms?

IBM has to worry about how a PC2 would be received by customers. Big buyers of the Personal Computer would scarcely greet the announcement of a noncompatible machine, however dazzling, with open arms. So even IBM will be constrained in its eventual announcement of a less compatible, newer technology product. Clearly it will have to offer hooks back into the older environment and the giant installed base that the Personal Computer's success has created.

IBM is, of course, technically correct in its recent PC2 comments to the press and the industry.

- There is no PC2. That is, whatever IBM is going to call the machine, it's not going to be PC2. Nor is PC2 a current internal code name for any IBM product. IBM always calls potential products by much more exotic names — like mountain ranges or wild animals.
- There is no PC2. That is, IBM has not yet selected the product that will replace or extend its current Personal Computer product line from among a number of contenders being developed, tested and politicked within IBM.

IBM normally looks at a number of possible products before making a major decision — four or five products for the original Personal Computer, for instance. The rich set of features you've probably glimpsed in articles about PC2 are a direct result of this IBM strategy. The press has actually fallen over four or five different products but has talked about them as if they were a single "super product," a real competition killer.

If IBM is going to continue to be in the personal computer business, eventually it must choose a product for the next major, but not necessarily the next, Personal Computer announcement. That is, there could be a further extension of the current family before IBM finally moves up to new, more powerful and different technology.

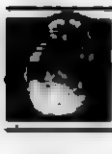
- There is no PC2. That is, IBM can't abandon its current customers who have so enthusiastically bought the current generation of IBM Personal Computers. Anything that IBM announces from now on will require some compatibility with its installed base. This, in itself, will allow IBM to deny forever that anything is a PC2, since if it's compatible at any level with the current product it can, with justification, be called an extension of the current product and not a new product at all.
- There is no PC2. That is, as long as IBM has lots of Personal Computers in inventory, it won't want to announce a new product and substantially reduce the value of existing assets. So if there are lots of Personal Computers still around, you can bet that IBM will try to sell them off first. If that doesn't work, it can always hold the fire sale later.

Of course the other personal computer vendors — everyone in the industry except IBM and possibly Apple, since they aren't trying to be particularly Personal Computer-compatible anyway — aren't very happy about all this. They need time to plan if they're going to be competitive and compatible with whatever IBM decides to do next. Their efforts to discover something substantive about IBM's activities is what fuels the furor.

Too bad. Short of a leak from within IBM (unlikely), based on an already-made decision of what to announce next (less likely), the competitors have to wait. And so will you, gentle user. But take heart. All things happen eventually. And you're probably not ready for all that new technology yet anyway. If you are, you know what to do. Tell the emperor you'd like to be invited to a fashion show.

Wohl is president of Wohl Associates in Bala-Cynwyd, Pa., and editor of the "The Wohl Report on End-User Computing" newsletter.

Three-phase approach to converting business users



HUMAN CONNECTION
Jack Stone

The press recently reported on a survey by Software Access, based in Mountain View, Calif., of U.S. households and their personal computer use. Based on the results, its president, W. L. Coggshall, was quoted as saying that "the preponderance of Americans cannot imagine any way they could use a personal computer, either at home or at work."

This conclusion should hardly come as a surprise to most data center managers who have struggled long and hard to convert even a tiny number of business folks to truly effective DP users and who know the uphill battle they face in extending this meager success to the rest of the population.

One data processing manager who has endured his share of frustration with user training has a novel approach to it:

"We tend to forget that the perspectives — and the expectations — of the vast majority of business users of computing equipment, be it mainframe, mini or micro, derive from appliance-class electronics, [for example], machines designed for acceptance by the broadest range of consumers.

"Until our systems can be packaged in a similar manner, the large percentage of users will continually rebel against them. 'After all,' they proclaim, 'to install our stereo and video equipment, we didn't have to spend a week in a classroom, study audiovisual tapes, read 400-page manuals — and we absolutely didn't need to fool around with an operating system.'

"The point is that the public expects a complex machine to be one that nevertheless plugs in and operates after only a brief bout with an installation manual — a situation that is a far cry from what we offer our users.

"But there is a second point to make that is not fully appreciated: the average citizen, after a successful break-in period with a new machine, routinely examines ways of optimizing performance, be it twiddling knobs on a stereo system or adjusting the height of the rug attachment on a vacuum cleaner.

"Obviously, the industry will not — and probably cannot — change its arcane ways in the short range. So we have to look for other solutions. One notion is a three-phase approach to bringing the users up to the point where they will embrace mainframe operations with open arms.

"The first phase involves the use of a low-cost, appliance-style computer for basic computer training, one that satisfies, or at least comes much closer to satisfying, the needs of typical neophyte users.

Information products without hassle

"Most important, it must provide immediate information products of significance and do so without any substantial hassle, particularly extensive training, or a need to understand an operating system.

"Then, banking on their demonstrated willingness to adapt and grow, in phase two I would expect to wean the users off the appliance onto a personal computer.

"Now this will only work after the staff develops reliable applications, based on proven, well-established software packages and loaded with automatic operating system procedures and keyboard macros so that the users can focus on data to be processed and the output results, instead of systems internals — which is the whole point of information systems in the first place.

"If this second phase of development goes well, then they would be ready for phase three, a transition to mainframe operations with all the technical eccentricities attendant thereto.

"For us, systems for phases two [IBM-compatible personal computer] and three [the mainframe] are in place, and recently I've found a system for phase one that seems promising. I'm looking at the Kyocera-class portable machine, like the [Tandy Corp.] TRS 100/200 and NEC Corp. 8201A.

"Most important, recently released packaged software from independent vendors has provided some simple but valid functionality — perfect for immediate, though elementary, production — and a complementary, easy-to-learn and [easy-to-use] processing capability for an IBM-compatible machine to handle files uploaded from the Kyocera."

Stone is a Washington, D.C.-based independent management consultant, educator and writer, specializing in DP human communications and personnel development.

IN ADDITION TO PRINTING TEXT AT 40, 100 OR 200 CPS, THE IBM PROPRINTER CAN PRINT ALL-POINTS-ADDRESSABLE GRAPHICS.
$
BANK
YOU CAN PRINT ON AN ENVELOPE OR A SHEET OF STATIONERY WITHOUT REMOVING THE COMPUTER PAPER.
THE IBM PROPRINTER SUPPORTS MOST POPULAR SOFTWARE.

Built to take it. Priced to take it with you. The new Proprinter from IBM.

There's just one thing that's as remarkable as the rugged reliability of our newest personal printer—and that's its price. Under $550.

The new Proprinter is built by IBM to last. And simplicity of design is what makes it so reliable.

Yet the IBM Proprinter is a full-featured machine. It has three printing speeds to give you everything from fast first drafts to sharp, near-letter-quality correspondence. It takes perforated computer paper for long jobs and —without removing the paper— will easily print on a sheet of stationery or an envelope, thanks to a handy slot in front.

With its all-points-addressable graphics and its comprehensive character set, the IBM Proprinter supports most popular software.

The new Proprinter attaches to every IBM PC and to other leading personal computers. And it's just part of our growing family of personal printers. All are designed to serve a single purpose: To give everything you do the finishing touch.

For the IBM Product Center or authorized dealer nearest you —or for free literature—call 1 800 IBM-2468, Ext. 90/LH. Or contact your IBM marketing representative.

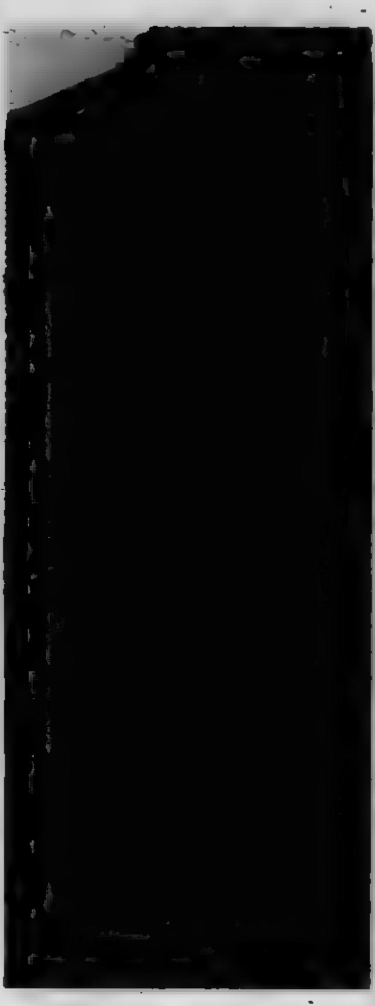
IBM Personal Printers...The Finishing Touch

Update

Getting serious about printers

By Glenn Rifkin
Update Editor



Among the early driving forces of office automation and business computing was the promise of an end to the mountains of paper that rose higher and higher with the birth of the information age. The promise, however, appears empty. "The paperless office will arrive," the saying goes, "the same day as the paperless bathroom."

Indeed, despite the sophistication of electronic transmission and the ubiquity of the desktop terminal, the desire for hard copy is, if anything, on the rise. For the printer industry, that spells good news. Soaring growth rates are predicted for the next five years and beyond. According to International Data Corp. in Framingham, Mass., total industry revenue should jump from $7.3 billion in 1985 to nearly $13 billion in 1989. The number of units shipped is predicted to increase from 6.4 billion this year to more than 15 billion in four years — growth that is driven by the personal computer.

The allure of the market has drawn such heavyweights as IBM, Digital Equipment Corp., Hewlett-Packard Co., Burroughs Corp. and Texas Instruments, Inc. Traditional printer makers such as Xerox Corp., Dataproducts Corp., Centronics Data Computer Corp. and Printronix, Inc. are gearing up to try and hold market share while fighting off both new U.S. entrants and the powerful Japanese manufacturers.

For the consumer — whether a data processing manager, information worker or home personal computer owner — the burgeoning market has been a mixed blessing. Prices have plummeted for many machines because of increased competition and advances in printing technologies. Unfortunately, the market has also become ensnared in a maze of confusion. According to Datek Information Services, Inc., a Waltham, Mass., consulting firm, there are nearly 150 companies marketing more than 500 printer models. "It is an industry that now boasts over one dozen distinct printing technologies with print lines ranging in size from 1 inch to 6 feet across," a Datek report says.

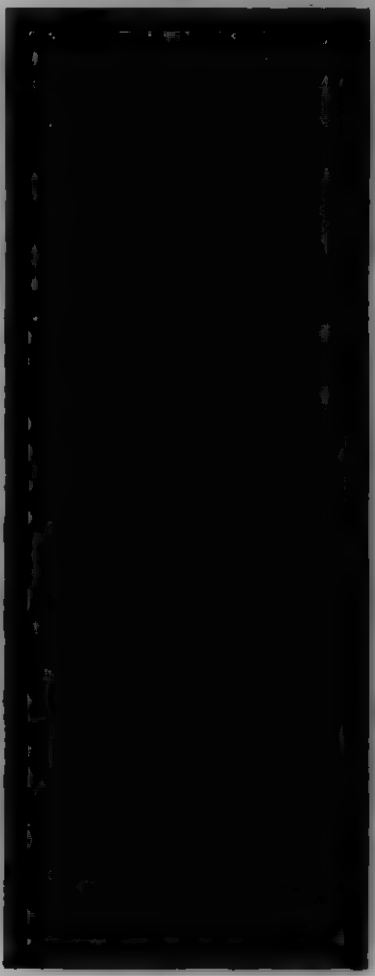
For the seller, the slice of the market pie is becoming tougher to acquire; and for the buyer, the purchasing decision on a printer has become increasingly complex.

The printer market is split into two key factions: impact and nonimpact technologies. Impact, which is an outgrowth of basic typewriter technology, encompasses any printer mechanism in which the blank page is struck by some print-head device. Nonimpact covers a growing parade of technologies in which the printing device does not come in contact with the page.

For the DP staff, the printer has become yet another key item on the high-tech shopping list, and both impact and nonimpact vendors are taking great pains to state their cases.

This section of *Computerworld* Update will explore the various components of the printer industry and assist the DP professional in making the proper purchasing decision.

Among the areas of focus are impact vs. nonimpact printing — the merits and demerits of both; the Japanese impact on the U.S. market; cost justifying the printer; IBM's influence on the market; a look at the software and controllers in sophisticated new machines; and new technologies — what does the future hold?



The impact side

"In the printer business, there are no revolutions, just evolutions," states Peter Steiner, an analyst with Dataquest, Inc. in San Jose, Calif.

This statement explains, more than anything, the staying power of impact printing, a technology that was expected to get swept aside by the onrushing waves of nonimpact machines. Though the new technologies such as lasers, ink jets, thermal transfer, magnetography and ion deposition grab the headlines, impact printers still generate the sales.

"The idea that nonimpact will rule the world and eradicate all impact technologies in the next five years has been suggested. But to our way of thinking, that is not going to happen," declares Jonathan Dower, vice-president of Datek.

"We show that by 1989, nonimpact printing will constitute only 25% of all revenue. It is currently just 9% or 10%," Dower says.

Though the trade press and industry consultants have embraced nonimpact technology with a passion, "in truth, the market has not really received it well," Dower says.

Industry watchers offer many explanations for why the nonimpact fire has not burned brighter, but it generally comes down to a basic tenet: Change does not come easily. It is not uncommon, for example, to find old drum printers, now considered a dinosaur among printers, hard at work in data centers.

In the multibillion dollar printer business, the role of impact printers varies according to market segmentation, but at virtually every level, the impact side continues to dominate.

The high end

In the centralized data center, the steady clattering of the workhorse — the fully formed character line printer — has become an ambient feature as recognizable as the hum of the mainframes. Though belt, chain, train and drum printers are all under the line printer umbrella, the band printer is the most popular of the DP center line printers. It is an entrenched mechanism that has withstood the test of time.

Capable of operating at speeds of between 400 and 3,600 line/min, band printers are known for their seeming invincibility. They chatter on hour after hour, day after day, year after year, turning out page upon page without missing a beat — and virtually never need repair. In a life of unexpected disasters and constant crises, the DP manager will not

PRINT from UPDATE/3

be easily convinced to part with this trusted printing machine.

"Just like with drum printers, there are lots of people out there committed to line printers, and you'll have to plead a tough case to get someone to switch to nonimpact," Dower says.

Another factor contributing to the staying power of line printers is again pragmatic: carbon-based multiple part forms. Regardless of the sophistication of electrophotographic nonimpact printing, those machines, by design, cannot strike the page and are therefore incapable of creating the multiple part forms that the billing, invoicing and accounts receivable departments require for their record keeping. Companies that print W2 forms, stock certificates, mass mailing cards and legal documents will continue to use impact printers. Until that requirement changes, the impact printer will remain a viable business product.

Dower

Though the market for impact line printers is relatively flat, it continues to generate in excess of $1 billion annually in sales. And in the past few years, when consultants were ready to declare the technology moribund, vendors such as IBM, Dataproducts, Centronics and Cynthia Peripheral Corp. responded by turning out new products that brightened the picture considerably.

IBM introduced its 4248 band printer in 1984, and the 3,600 line/min machine quickly became the Cadillac of the market. Earlier this year, IBM reconfirmed its commitment to the technology by unveiling its 4245 band printers (Models 12 and 20), which are capable of 1,200 and 2,000 line/min respectively. At that introduction, IBM also announced 25% price reductions on its high-end line of band printers and 12-month warranties on both the 4248 and 4245.

According to Jack Smulovitz, IBM's planning manager for impact printer product development, the warranty is significant as "a statement of the quality of the box" (see story Update/18).

As Dower points out, IBM's offerings are, from a cost/performance perspective, "extremely competitive with [nonimpact] page printers.

"IBM has an enormous installed base of line printers," he continues. "If they just went out and sold replacement printers, they could keep themselves in business for years."

Big Blue's introductions perceptibly brightened the prospects of the other major players in the impact game. Dataproducts, the Woodland Hills, Calif., printer manufacturer, has long dominated the line printer business as a supplier to OEMs and value-added remarketers. For Irving Weiselman, Dataproduct's vice-president of technology assessment, IBM's imprimatur "is saying this is important, and the market will be around for a while."

For Dataproducts, the timing couldn't be better. In order to remain a leader in the printer business, the company has begun exploring new avenues and markets. It recently introduced its first nonimpact printer, the LVR 2600 26 page/min laser with a Toshiba, Ltd. engine. It has also entered the retail market selling printers under its own label. But the company's bread and butter continues to be its sales of impact printers to OEMs like DEC, Wang Laboratories, Inc. and Prime Computer, Inc.

"The strength of our company is the friction-free flex hammer mechanism that is the heart of all our impact printers," Weiselman says. "They don't need maintenance, and they go on forever."

Weiselman indicated that Dataproducts is soon to announce a new version of the hammer mechanism that will be part of a new band printer designed to replace its now aging B series. Acknowledging that nonimpact will make inroads into the impact world, the company plans to offer more new nonimpact machines. "But we're still very committed to the impact world and plan to be there a long time," Weiselman says. "Impact will still be dominant."

Ironically, it is the very quality and reliability of the high-end band printers that has caused the market to stagnate. Having an installed base of machines that "go on forever" and are by now fully paid for, the DP manager is not in any hurry to make a change. As Dower points out, the buying decision for many is a nondecision.

"People tend to not make any decision," he explains. "They just stick with what they have.

Update

Japanese companies making waves in U.S. printer mart

By Peter M. Steiner
Special to CW‡

Like the automobile, home appliance, wristwatch and audio/video markets, the U.S. electronic printer market has undergone dramatic changes as a result of products imported from Japan.

Usually the most discussed subject concerning Japanese products is price. In the lower speed segments of today's printer market, price is a key factor, but a broader scope is required to understand Japan's true impact.

Both the dot matrix segment and fully formed (daisywheel) segment of the serial printer market were established and dominated by U.S. manufacturers, including Centronics Data Corp., Diablo Systems, Inc. and Qume Corp. The first real Japanese market impact came in the serial dot matrix arena in the 80 char./sec. to 100 char./sec. speed range.

It is true that pricing did give Epson America, Inc. and Okidata Corp. an advantage, but the real struggle was for volume and market share. Volume is extremely important to Japan's "just-in-time" manufacturing technique as well as to its "full quality control" approach.

A factor that contributed to the Japanese companies' successful sales penetration was the establishment of excellent marketing organizations. The truly successful companies invested heavily in marketing groups that are clearly the pride of the industry.

As more Japanese companies entered the dot matrix market, each was driven by the same basic equation: market share equals volume sales equals lower production costs. Thus, the early market leaders found themselves in a pricing/margin squeeze.

To escape this situation, more features and functions were added to the printers to maintain price levels. This cycle continues today with the net result being more performance for the dollar.

The daisywheel market segment followed the same pattern as the dot matrix segment, although it took much longer for Japanese companies to become a significant factor. Once they did, however, they made their presence felt. Japanese companies fully dominate the low-cost, low-speed — under 20-char./sec. — segment of the daisywheel market. Japanese companies had an 86% share in that market segment during 1984.

The fact that the Japanese hold 74% of the serial printer market has drawn a response from several U.S. companies. Some manufacturers have moved to special niches, and others moved to offshore manufacturing, either for subassemblies or for complete machines.

Steiner

The most notable response came from Hewlett-Packard Co., which introduced its extremely successful ink-jet printer, the Thinkjet. Designed to be a quiet replacement for dot matrix printers, it found immediate market acceptance.

The unique thing about the $495 HP Thinkjet is the low-cost head ink supply cartridge. Both functions are combined in a throwaway unit costing less than $10. The serial printer world is still waiting for a competitive response as well as an HP follow-on product. IBM introduced its 200-char./sec. dot matrix Proprinter for $549. Designed for low-cost manufacturing, this fully featured printer literally snaps together without screws, nuts or washers.

High-resolution impact dot matrix printers were developed more rapidly in Japan to meet the needs of Kanji, the Japanese alphabet. This created the argument over whether 18-pin heads or 24-pin heads were best suited for near-letter-quality printing in the U.S.

The real answer was once again keyed to volume production requirements. Character sets were digitized to take advantage of the 24-pin design so that both the Far Eastern and

Update

PRINT from UPDATE/4

That's why drum printers, which everyone knows is an archaic technology, are still around.

"Line printers have a remarkable life history, and 20 years is nothing; they still run fine.

"In the DP site, people tend to buy new systems but don't get new printers, which is why the market moves more slowly than anyone suspects."

The middle ground

While band printers hold up the high end of the impact market, dot matrix line printers have sparked considerable interest in the middle ground, with speeds from 300 to 900 line/min. In fact, though growth in the band printer market remains flat, matrix line printers have experienced strong growth (up to 25% annually, according to Datek) in the past few years. Nonetheless, it remains a relatively small market.

Traditionally targeted to such special applications as bar coding and labeling, matrix line printers have picked up speed in recent years and now offer several advantages over band printers. Like serial dot matrix printers, they can handle graphics and color.

This ability, according to industry analysts, is becoming a major requirement for DP shops. "A DP manager now has a choice when it comes to graphics," Dataquest's Steiner says.

"He can use the line dot matrix, which has fairly good speed and will serve both his line printer requirements as well as some imaging requirements, or he can look to digitized imaging using lasers."

If speed is not as critical as flexibility, line dot matrix printers can be an economical choice for the DP manager.

Such vendors as Printronix, HP, IBM, Mannesmann-Tally, Inc. and Genicom Corp. offer 300 to 600 line/min machines for under $8,000. If speed is an issue, HP offers its 2566 matrix printer, reportedly running at 900 line/min — the fastest matrix on the market. But it costs $21,500.

According to Chuck Ulfers, HP's marketing manager for system printers, the matrix line printers provide a good, heavy-duty solution with the capability to run 16 to 20 hours per day.

"Customers' major concern used to be cost of ownership," Ulfers says. "They didn't think much about print quality. Now we're at a sort of midway point, and interest is growing in print quality and flexibility."

On the down side, matrix line printers may be a niche that has nowhere to go. Despite its growth, the market is small and is being nipped at from several sides. High-speed serial dot matrix printers, capable of speeds of up to 300 char./sec., are grabbing for market share at the low end, but consultants concede that even though technological breakthroughs may allow even greater speeds for matrix line printers, by the time it happens users may have already switched to nonimpact page printers.

Speed information is also misleading. Though a company may tout its printer as running at 600 line/min, it has variable speeds, and for such applications as graphics it may operate at considerably slower speeds.

The low end

For the DP/MIS manager, the issue of decentralized, distributed processing remains a priority today. Though not the most critical concern, peripherals are vital to the organization.

The influx of personal computers and workstations among Fortune 1,000 firms

SCIENCE/SCOPE

In a historic milestone, a prototype high frequency hopping radio system has been tested successfully over several complex communications paths that were not restricted to line of sight. Frequency hopping techniques have been previously used only in the VHF and UHF portion of the radio spectrum to enhance the antijam capabilities of tactical and strategic military communications systems. The recent tests, conducted by Hughes Aircraft Company engineers under contract to the U.S. Army, covered the high frequency range from 2 to 30 MHz. They showed that antijam communications are now possible over great ranges without line-of-sight paths, which require repeater stations or satellite relays. Hughes is developing the system, called Short Term Anti-Jam (STAJ), as a retrofit enhancement kit to its existing line of U.S. military standard high frequency tactical radios.

High-energy laser pointing and tracking systems are among the advanced electro-optical systems supported by the Albuquerque Engineering Center in New Mexico. The center's scientific disciplines include physics, optics, mathematics, lasers, image processing, electro-optical control systems, and computer science. Programs involve electro-optical sensors for strategic military applications, including work performed at the U.S. Air Force Weapons Laboratory at Kirtland Air Force Base and the White Sands Missile Range. The Hughes center is expected to expand from its current staff of 42 highly trained professionals to greater than 100 over the next three years.

Complex microelectronics will be produced faster and better in a "paperless" factory in which computers instantly collect data and process work instructions. A new 71,000-square-foot facility at Hughes in Tucson, Arizona, will make complex custom hybrids—historically a major manufacturing challenge — for advanced missiles. The heart of the facility is a computer that ties into business and CAD/CAM (computer-aided design/computer-aided manufacturing) computers and scores of terminals at work stations. Labor requirements will be cut by up to 60%.

An upgraded weapon system and other improvements will help the F-14 Tomcat fighter deter and cope with threats for several decades. Designated the F-14D, the U.S. Navy aircraft will be equipped with an advanced digital radar, new engines, advanced avionics, and the capability for launching Hughes AIM-120 Amraam and AIM-54C Phoenix missiles, as well as the latest versions of Sparrow and Sidewinder missiles. The AN/APG-71 radar will include a fully programmable signal processor and companion radar data processor. These units will provide digital capabilities, as well as digital radar displays, advanced electronic counter-countermeasures, and improvements in the aircraft's detection and tracking range and accuracy. Hughes will provide the upgraded APG-71 under contract to Grumman Aerospace Corp., prime contractor on the Navy F-14 improvement program.

An ultramodern facility spanning 1.75 million square feet is the showcase where outstanding Hughes engineering combines advanced manufacturing techniques and production processes. Our complex is complete, so we're looking for experienced and graduating engineers to work on such programs as infrared thermal imaging systems, laser rangefinders and designators, artificial intelligence, signal processing, VLSI, component qualification, hybrid microcircuitry, and focal planes. Send your resume to Hughes Electro-Optical and Data Systems Group, Professional Employment, P.O. Box 913, E9/W101, Dept. S3, El Segundo, CA 90245. Equal opportunity employer. U.S. citizenship required.

PRINT from UPDATE/6

has brought with it a concurrent mass of printers. As local-area networks and remote computing become more prevalent, the hard-copy wish list of the information worker will fall on the MIS manager's desk.

Although nonimpact vendors are touting their page printers as the perfect shared resource in the office, the serial dot matrix continues to be "the bread and butter of the industry," according to Maureen McManus, manager of the printer market program for IDC. With the personal computer driving the low end, dot matrix printers are the leading printer product sold. Though the 1984 numbers differed — Datek estimated 3.6 million units shipped, IDC put the figure at 2.5 million — it is clearly a massive market.

Also experiencing continued high interest on the impact side are serial fully formed character (or daisywheel) printers. According to Datek, daisywheel printers accounted for 1.1 million units and $1.6 billion in sales in 1984, making it the second largest market area for printers.

For the DP/MIS manager, as well as the individual buyer, this market is crowded and confusing. IDC estimated that more than 150 vendors are selling either serial dot matrix or daisywheel — or both — printers. Though many companies are simply buying a printer on an OEM basis and slapping their names on the box, some significant vendors are jumping seriously into the market. IBM, which until this year had simply been the OEM for Epson America, Inc. printers, now has entered the market with its own $549 Proprinter, a dot matrix machine, and the Wheelwriter, which uses a daisywheel.

DEC, which offers a range of impact and nonimpact printers (mostly sourced from the likes of Dataproducts, Xerox, Ricoh Electronics, Inc. and Tokyo Electric Co.) has recently announced its LA210 office printer. This model, developed internally and manufactured in Taiwan, is the company's most popular dot matrix printer, according to Suzanne Skinner, base product marketing manager. A redesign of the LA100, the LA210 is compatible with DEC's personal computer line.

Given the volatility of this market, DEC and other computer makers plan to do whatever it takes to grab a

See PRINT UPDATE/10

To get a lot out of your printer, you need a lot of programs, right?

Wrong.

Sure, you could buy one package to change type sizes, another to create fonts, and still another to print sideways.

Or you could get one simple program to do it all!

Printworks.™ It's loaded.

SoftStyle®

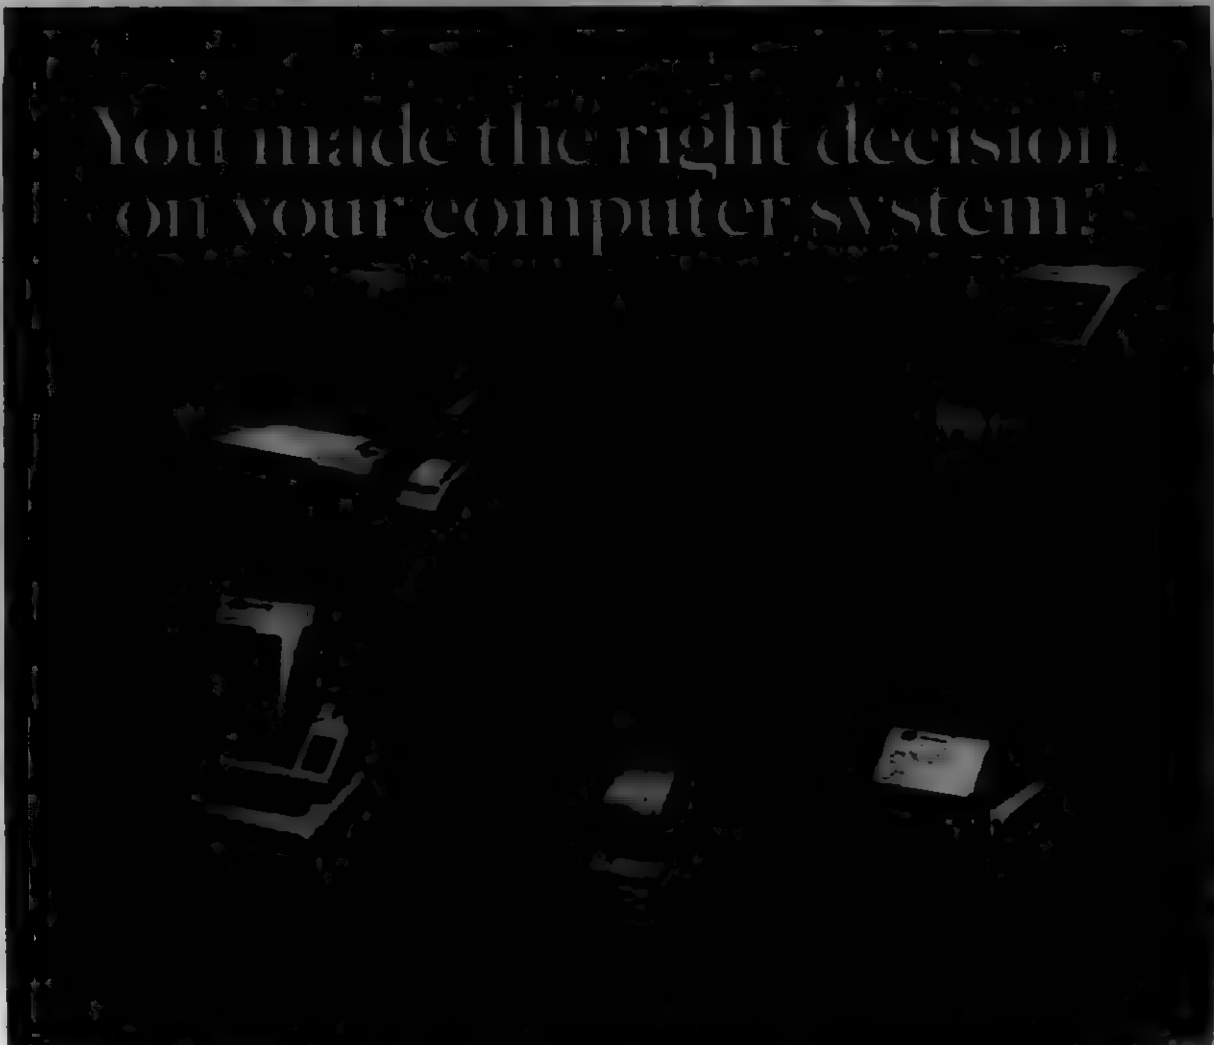
$89.95. Enhances over 30 dot matrix printers, including Epson and Okidata. IBM PC or compatible.



[illegible] these printers, choose Interface Systems.

Where computers are concerned, IBM is the best investment you can make for your company. But when it comes to printers, Big Blue is *not* your only alternative.

Your best choice is Interface Systems, Inc.

Whatever the application, Interface has a plug-compatible printer to meet your needs. We offer a complete line of IBM 3270 and IBM System 3X compatible printers. Everything from compact, countertop dot matrix and solid-character letter-quality models to full-size line printers. With our new laser printer in between.

With Interface you get more printer for the money. Plug-for-plug compatibility. Fully integrated (no boxes!). Faster throughput. Unique features like "demand document," large-character label printing, bar coding, and automatic sheet feeding. With nationwide service for every model. Each priced significantly lower than its IBM counterpart.

When you choose Interface, you're *not* taking chances on an industry newcomer. Over the past decade, we've supplied printers to over 1,000 customers throughout the world. Our flexible buy-or-lease agreements have helped users maximize their printer investment.

For more information on the Interface Systems alternative, call 1-800-544-4072. (In Michigan, 313/769-5900.) Or write to Interface Systems, Inc.,

The Right Printers for the Right Computer Systems

Update

Impact vs. nonimpact: The hard-copy battlefield

Technology battle lines are not usually as clearly drawn as they are in the world of printers. Impact printers — the entrenched, traditional workhorses of the data center and beyond — are being challenged openly by the various technologies that make up nonimpact printing.

Though impact machines are currently holding their own, the encroachment of the new breed is being felt as prices for nonimpact machines go down and reliability and versatility go up. Pundits on both

[illegible]

As nonimpact technology gets cheaper and better, how will the impact world fight it off?
Kilcullen: To answer that, you have to go through a few different tiers of price/performance ranges and applications. Starting at the low end, or the personal computer end, of the product line, nonimpact technology is coming forth with serial printers that use thermal transfer technology on one hand or ink-jet technology on the other hand. In the impact arena, we have the low-cost daisywheels and the very low-cost impact dot matrix.

When you look at the four different technologies, the one that I would be most worried about, if I had it in my product line, is the daisywheel, because without graphics it really doesn't provide the utility that people are looking for in the low end of the office environment.

Thermal transfer printers are probably the lowest cost approach, but from a user's standpoint, [they] are relatively limited because of their need to use very smooth, highly finished paper. Certainly in the U.S., where we tend to use a high rag content paper, the print quality is very poor.

The ink-jet is a nice niche product which addresses some color applications, but once again, it won't be super price competitive with impact matrix. Impact matrix has gotten to be very cost competitive and addresses the widest range of potential applications with its graphics capabilities, levels of print quality and levels of throughput. And there is still the need to do multipart documents.

What about the higher end?
Kilcullen: The applications there are going to be filled by the higher performance daisywheel printers, the higher performance serial matrix printers and the lower cost laser printers. They are the three challengers. The big issue there, I believe, is the total cost of ownership of each.

Please explain.
Kilcullen: When you look at the "consumables" aspect of the [Canon USA] CX-based machines with the operator-replaceable module that replaces, in one operation, the photo receptor, the toner and other aspects of the wear items in the printer, that is a pretty high ongoing bill. If you look at duty cycles, it can average you $75 to $100 a month. And with the complexity of that product, you are going to have service calls, certainly more than one a year. Laser printers traditionally have been very service intensive.

On the other hand, we have made significant strides in the impact matrix printers relative to reliability and cost of ownership. The cost of replacing a ribbon every 45 to 90 days at $15 apiece is significantly less than replacing the guts of a nonimpact laser printer.

Robert Kilcullen

'You get a lot more bang for your buck with an impact printer today than you did three years ago.'

The [mean time between failure] of serial impact matrix printers has improved by orders of magnitude over the last five years.

What about the question of versatility and functionality?
Kilcullen: Serial matrix printers have evolved to address some of the specific needs of a user — addressing, for instance, transaction processing where one wants to get a document printed and immediately available to the user. You have demand document tear-off right after the last printed line. You have the ability to insert a document — for instance, a car rental form — that might have information on it already and it's brought back and you can insert it into a printer, print out the remaining information and get it back.

The ability to handle color, although [that] is handled very nicely by ink jet at the low end. But in the middle range, a cost-effective way of doing it with electrophotographic technology has not really been established, and it would be a relatively expensive, complex product.

What about at the data center end?
Kilcullen: Nonimpact printers made their first impact back in the mid-1970s addressing the very, very high-volume print shops with the IBM 3800 and the [Xerox Corp.] 9700. But they went into sites that primarily had very high usage and could almost have justified a field engineer on site because those things go down — they print 18,000 lines a minute — but they are probably down every two hours. You need somebody around to fix them.

But the 2,000 line/min impact printers were certainly affected by the introduction of those types of products. Once again, the trade-off primarily was reliability. People with that demand tended still to want an impact printer. Plus, certain applications need multipart copies; people still don't necessarily trust magnetic storage. So that still is a need that hasn't been and won't be replaced by nonimpact in the foreseeable future. It is interesting to note that IBM announced, in the last year, five new high-speed impact fully formed character line printers.

Consultants seem to think that when the time comes to replace the old band printers, the DP manager will turn to nonimpact technologies.
Kilcullen: Certainly the growth has flattened out [in the impact printer market], but I don't see it as a shrinking market. I can't believe that IBM would make the investment that they did in the 4248 and the 4245 if they didn't see that they were going to have production adaptation. Let's face it, at that end of the business there is no one that should have a better handle on the user base than they do.

What about the unlimited potential of nonimpact vs. the limits of impact?
Kilcullen: It certainly has become a significant factor. The resolution and the flexibility will allow the nonimpact segment, especially in the mid-range [and] up, to grow and to grow significantly. But it doesn't spell death, doom and disaster for the impact world at the same time. The growth rates probably won't be what we experienced in the past, but there are many applications and many reasons why impact printers will continue on and grow, certainly at a more moderated rate.

What about all the publicity surrounding nonimpact? Is the user just ignoring this?
Kilcullen: I've been in this business for about 15 years, and the first time that top management in the company became alarmist about nonimpact taking over the world was about 1970 or '71 when I was on a joint planning committee to look into those technologies. It's always been the dark cloud hanging over our head. Progress has been made in the nonimpact area, but at the same time, the flexibility and the price/performance point with impact printers has been dramatically affected. You get a lot more bang for your buck with an impact printer today than you did three years ago.

So quietly, while all the publicity has been focused on nonimpact, the impact technology has improved as well?
Kilcullen: Yes. You have graphics, color capability, demand documents, a combination of cut sheet and fanfold paper. Acoustics have been improved, head life has been improved and, not the least of which, the cost has improved. Our lowest cost impact serial printer has a retail price of $299. Look back three years ago — who would have ever dreamed that you would be able to buy a printer like that for $299? ■

Update

sides have made their predictions about the future of the printer market. Some openly predict a lopsided victory for nonimpact — a complete takeover of the market within 15 years — while others are adamant about the staying power of the impact world.

Other industry observers tend to agree that although growth in impact sales is slowing and nonimpact numbers are growing rapidly, there is a place for both technologies. Applications, not bells and whistles, will drive the market and users will, as usual, determine their purchases by need, not technology.

Nonetheless, both sides have strong arguments in favor of their respective technologies. *Computerworld* Update Editor Glenn Rifkin interviewed leading proponents for each side of the issue. Representing impact printing is Robert Kilcullen, vice-president of marketing, sales and business management for Centronics Data Computer Corp. of Hudson, N.H. Speaking out for the nonimpact side is James L. Busby, president and chief executive officer of QMS, Inc. in Mobile, Ala.

Centronics, although undergoing internal changes, remains a leading manufacturer of dot matrix and line impact printers for the OEM market. The company was acquired in 1982 by Control Data Corp. Kilcullen joined Centronics in 1977 from CDC where he was responsible for several functions, including product marketing in its printer division. He has 13 years of experience in the area of computer printers.

QMS, formerly Quality Micro Systems, Inc., is a manufacturer of a series of medium to high-end laser printers with a range of graphics options. Founded in 1977 by Busby, QMS has grown to 300 employees and sales of $31 million. A native of Mobile, Busby is an inventor, pilot and blue-water angler with degrees in electrical engineering from the University of Alabama and business administration from the University of South Alabama.

[illegible]

Despite all the publicity surrounding nonimpact printing, the numbers still strongly favor impact. What has to happen to stimulate some growth in this area?

Busby: Initially, laser printers had two basic hang-ups that kept them from successfully competing against impact printers. One was cost; they were much more expensive. The second was reliability because the impact technology was much more reliable.

Over the last year or two, however, you have seen the price of nonimpact printers coming down significantly to the point where Hewlett-Packard introduced the $3,500 [Laserjet] machine. I believe that pricing on nonimpact printers is going to continue to decline over the next couple of years very significantly, to the point where it will represent extremely strong competition against impact printers.

What about reliability?

Busby: Presently, what you get with nonimpact printers is what you pay for. If you get a Canon U.S.A. LBP-CX-based machine, you get a machine which has a 3,000 page-per-month duty cycle and a life expectancy of something like 100,000 pages.

If you want to pay more money and get something, for example, that is based on a Xerox Corp. XP12 print engine, then you can get a machine that's rated at 15,000 pages per month and has almost an unlimited life expectancy. So the reliability is there if you are willing to pay for it. As time goes on, the reliability is going to go up as the price comes down. We hear talk from some Japanese print engine suppliers that they will be producing in the next year or two some very inexpensive print engines with very high duty cycles.

Nonetheless, the numbers are still heavily weighted in favor of impact.

Busby: We see a much higher level of activity in our marketplace than we saw even a year ago or six months ago. We have every reason to believe that the market is not slowing down and, in fact, is accelerating quite rapidly or is going to over the next some months.

Generally, people are reluctant to change, to give up what they are used to for a more complex technology. How will the nonimpact world address that?

Busby: That is one of the problems that we recognized early on as being a barrier to getting into the marketplace and the only answer to that is educating the user.

I think it is just a matter of education and a matter of time. We have seen a very quick acceptance of laser printer products in the field.

What will drive this market at the high end, the data center end?

Busby: Having the right application software so that you can just unplug what you were using before and be able to plug this device in and have it do something useful.

Also, having software packages available which utilize the capability of laser printers. Most of the software that is available today is still based on using impact printers of various kinds. So as time goes on, there will be a lot of companies writing software that supports laser printers . . . and takes advantage of the features and at that point, it will become more cost effective to spend a few extra bucks and get a laser printer.

The band printer market continues to sell well in the data center. What form of nonimpact technology can take on the band printer?

Busby: Certainly not the present state of laser printers because the duty cycles aren't even beginning to approach those of band printers.

Another question that seems to have no answer in the nonimpact world is the multiple-part forms question.

Busby: There are some applications where you are going to need the impact printers no matter what — for example, where you have multiple forms and very high speeds. The main answer with the nonimpact printer is to be able to print multiple copies in a serial fashion and also to be able to print on both sides of a page.

There are print engines that are coming out relatively quickly, I believe before the end of this year, which will be relatively inexpensive and will be able to print on both sides of the page. If you have a laser printer that is five times faster than a similar impact printer, then certainly you can print five copies one after the next as fast as that printer can print five all at the same time. That is the only solution to that problem.

What you are saying is that you don't really believe that nonimpact will totally transplant impact.

Busby: Not totally.

What do you think the market will shape out to be, say in five to 10 years in terms of impact vs. nonimpact?

Busby: My opinion is that within five years, 80% to 90% of all printers sold will be nonimpact printers. I can see it happening right now.

Impact printers seem to have made their presence felt in the high and low ends but not in the middle ground. What can we expect there?

Busby: The problem is that there has not been a print engine, a marking engine that addressed the middle of the marketplace. I firmly believe that by the end of this calendar year, there will be more than one print engine — at least two, maybe more than that — that will address that segment of the marketplace with duty cycles as high as 50,000 pages per month and which are relatively inexpensive.

You think that these are going to come from the Japanese?

Busby: Yes. Although I believe Xerox will announce an engine in that area.

What about IBM?

Busby: I think IBM is likely to impact the U.S. market in much the same way with the laser printer that they did with their [Personal Computer]. When IBM announces a relatively low-cost laser printer, the market will really explode. IBM certainly will be the most dominant competitor from the U.S. They may very well beat out the Japanese.

You feel graphics are a key driver for nonimpact technology?

Busby: Exactly. At this point, with impact printing, you typically get somewhere between 5,000 to 10,000 dots to the square inch. With nonimpact printing, you are now getting 90,000-plus dots. With that kind of resolution, you can do not only better text, but you can also do lines and boxes so that you can create people's forms and fill them in all at the same time. You can do people's signatures and put the signature as part of the document; you can even put somebody's picture as part of the data that you send to the printer. The flexibility becomes enormous.

There are hundreds of printer vendors selling hundreds of products using dozens of technologies. What can the DP manager do to make sense of all this?

Busby: The DP manager just has to continue to keep himself educated because this marketplace is changing so fast. He has to look at what is available and what his needs are. He has to purchase his products based on what he needs to do with those products and not just because it is some sexy new technology.

from UPDATE/7

share of the pie. John Bernard, a DEC product manager, states, "We'll build internally or buy what we need to be timely in the market."

For the vendors, the issues are becoming clear. The Japanese have controlled the low end of the market since personal computing became popular. Such companies as Epson, C. Itoh Electronics, Inc., Okidata Corp. and Star Micronics Co. have established a strong presence in the U.S. by selling their own machines, and a spate of other Japanese firms have gained a foothold through OEM agreements. The Japanese, in fact, have been entrenched leaders in several different printer categories (see story Update/5).

For the U.S. manufacturers, the decision to compete in this arena is fraught with peril. Industry analysts agree that a shakeout — some say bloodbath — is coming as price erosion cuts deeply into profit margins.

"We've said all along you're going to see mergers, acquisitions and dropouts," Steiner says. "The total available market is saturated at the low end." For the user, however, the choice is more attractive than ever. As prices fall, the products are becoming better and faster.

Fujitsu Ltd., Toshiba and Epson have begun marketing printers using 24-pin printer heads, which provide denser, higher quality output than the standard 18-pin heads.

"The matrix printer has sharpened the advantage of its versatility — that is, its graphics handling and its font quality have been improved at no threat to its low cost, ease of use or volume handling ability," a report from IDC states.

Daisywheel or character printers, another area where the Japanese hold market leadership, continue to show strong growth as well, but this may be the technology most vulnerable to encroachment from nonimpact printers.

Though it provides the least costly letter-quality output, the daisywheel printer, by virtue of its fixed print-head design, is the least flexible technology.

Despite this drawback and the dire warnings, the daisywheel has done quite well. According to an IDC report, none of the new technologies have been able, thus far, to unseat daisywheel printers.

"Led by price cuts and introductions of models priced under $500, [daisywheel] printer shipments in 1984 were over 70% better than in 1983, growing from 420,000 to over 700,000," the report notes.

This optimism may be temporary, however, and has not stopped the visible palpitations of such U.S. market leaders as Diablo Systems, Inc. and Qume Corp.

Unable to compete with the economies of scale and automated factories of the Japanese, many U.S. firms have taken their manufacturing work offshore or have spent millions of dollars redesigning their own plants.

For Diablo, a subsidiary of Xerox, the handwriting seems to be on the wall. Roger Kiel, vice-president of the Xerox printing systems division, made it clear that the company is committed to nonimpact technology, an area in which it is a leader. Referring to Diablo, Kiel says, "That business end is becoming less important.

"In terms of shipments of a certain class of printer, say 80 char./sec., we think that marketplace will peak within the next one to three years and will be starting on the downhill side by the end of the decade."

Whichever technology is preferred, the DP/MIS manager will certainly have some decisions to make. Personal computer printers tend to average nearly 1:1 ratios with personal computers, and predictions for future growth remain high.

IDC estimates that there were 5.5 million personal computers on corporate desks in 1984 and expects the figure to grow to 35 million by 1989. This influx is going to have a major impact on shipments of printers for use with business micros.

As the questions of local-area networks, shared data bases, micro-to-mainframe links and communications are answered, the micros will not only connect one to another but will create shared access to peripherals.

As the IDC report points out, "When 150 [personal computer] users all have access to a single [or single group of] printers, it is possible to amortize the cost of a smaller number of more expensive printers — printers with the capability to handle more volume, at higher speeds and with higher quality output."

The nonimpact side

Though nonimpact page printers accounted for less than 1% of all printers shipped in the U.S. in 1984, according to Datek, the technology is clearly generating a great deal of excitement. "Once people see the quality in their hands, there's no turning back," states Charles Pesko, president of C. A. Pesko Associates, Inc., a Marshfield, Mass., consulting firm.

For impact boosters, that is a tune that's been heard before. Predictions of multibillion dollar markets for nonimpact printers were trumpeted in the late '70s and early '80s, but those numbers simply failed to materialize. Most consultants remain cautious about the future of the technology, but both impact and nonimpact supporters are now acknowledging that strong inroads are finally being made. A testament to that fact is the sudden interest in nonimpact technology on the part of traditional impact vendors.

"Nonimpact is definitely cutting into the impact market," IDC's McManus says. "The fastest growth rates are on the nonimpact side in several categories." Sales of page printers are growing at an annual rate of 110%, she says, with serial nonimpact sales growing at 60% to 70%.

Numbers, of course, can be misleading. While one consultant predicts that nonimpact will hold just 25% of the printer market by 1989, another consultant expects that 40% will be nonimpact. Those figures, in fact, are more likely to influence vendor decisions than user purchases anyway.

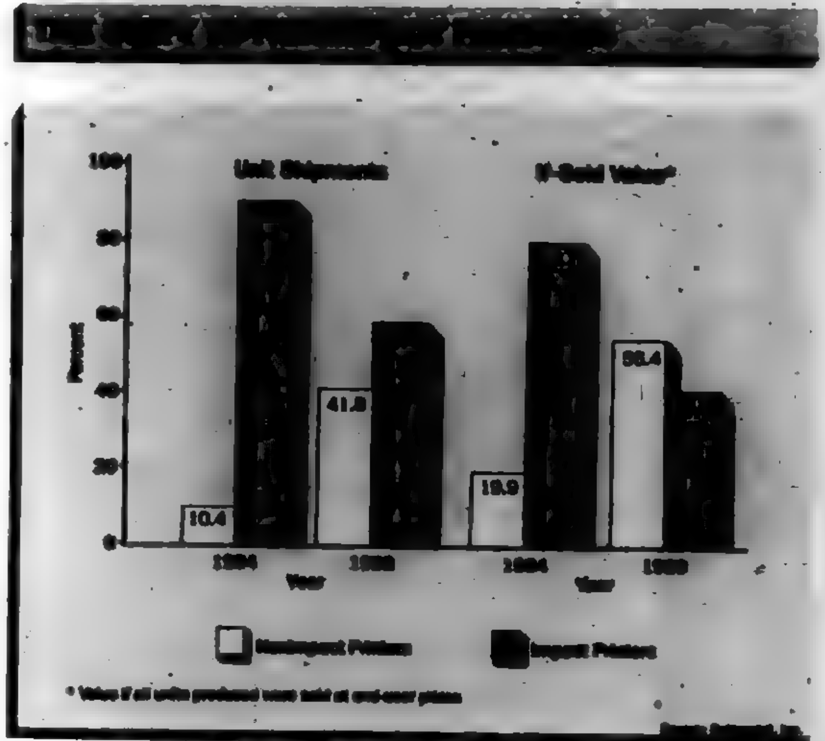
For the DP/MIS manager, there are other considerations, and nonimpact technology has certainly warranted attention. In fact, advances in the technology have started to pay off in ways that can no longer be ignored. Price/performance levels have dropped dramatically for electrophotographic laser printers, and this decline has opened up a new world of in-house printing possibilities that impact machines simply cannot address.

In addition, alternatives to laser printers, which currently hold sway in the market, are cropping up, and a few appear to have long-range possibilities in both general and niche markets.

Using sophisticated software and techniques borrowed from the computer and copier worlds, nonimpact printers are becoming intricate devices capable of speeds and functionality that may well change the nature of hard copy forever.

It is this very complexity that has kept the nonimpact printers from fulfilling their promise.

See PRINT UPDATE/11



Update

PRINT

from UPDATE/10

Nonimpact printers have gained a reputation for being temperamental, unreliable and expensive. "The DP or office manager hears the click, click, click of the counter on a nonimpact printer and still thinks 'that's 4 cents per page,' " McManus says. "The vendors are working hard to make them simpler, less expensive and more user maintainable."

"There will always be resistance to change," Xerox's Kiel adds. "And somebody always has a real need for doing things the way they used to. But by the end of 1983, one third of the pages printed in large data centers were [printed] on nonimpact machines. And I would suspect that by the end of 1985, that number would approach the 50% level."

From the high end to the low end, nonimpacts are clearly adding another choice to the printer buying decision. In fact, according to Steve Josselyn, senior consultant at IDC, the sophistication of these machines has been the catalyst for DP/MIS departments to create printer purchasing policies.

"Some of the issues are changing, and companies are looking to establish policies for centralized vs. decentralized printing," Josselyn explains. "Before, there were not enough products to choose from, and decentralized groups which wanted high-quality printing didn't have many options. Products are coming out now which are changing that."

The products cover a range of technologies such as ink-jet, electrophotographic laser, ion deposition, LEDs, liquid crystal shutters, magnetography and thermal transfer. Though all have virtues, laser printers have clearly captured the early lead in the nonimpact race.

"Lasers are hot," DEC's Bernard says. "Our customers are asking for them."

The high end

It may seem that the excitement surrounding laser printing began just yesterday, but the technology is an old and established one in the data center. IBM introduced its 3800 high-speed laser printer in the early 1970s, and Xerox followed quickly with its 9700 laser printer.

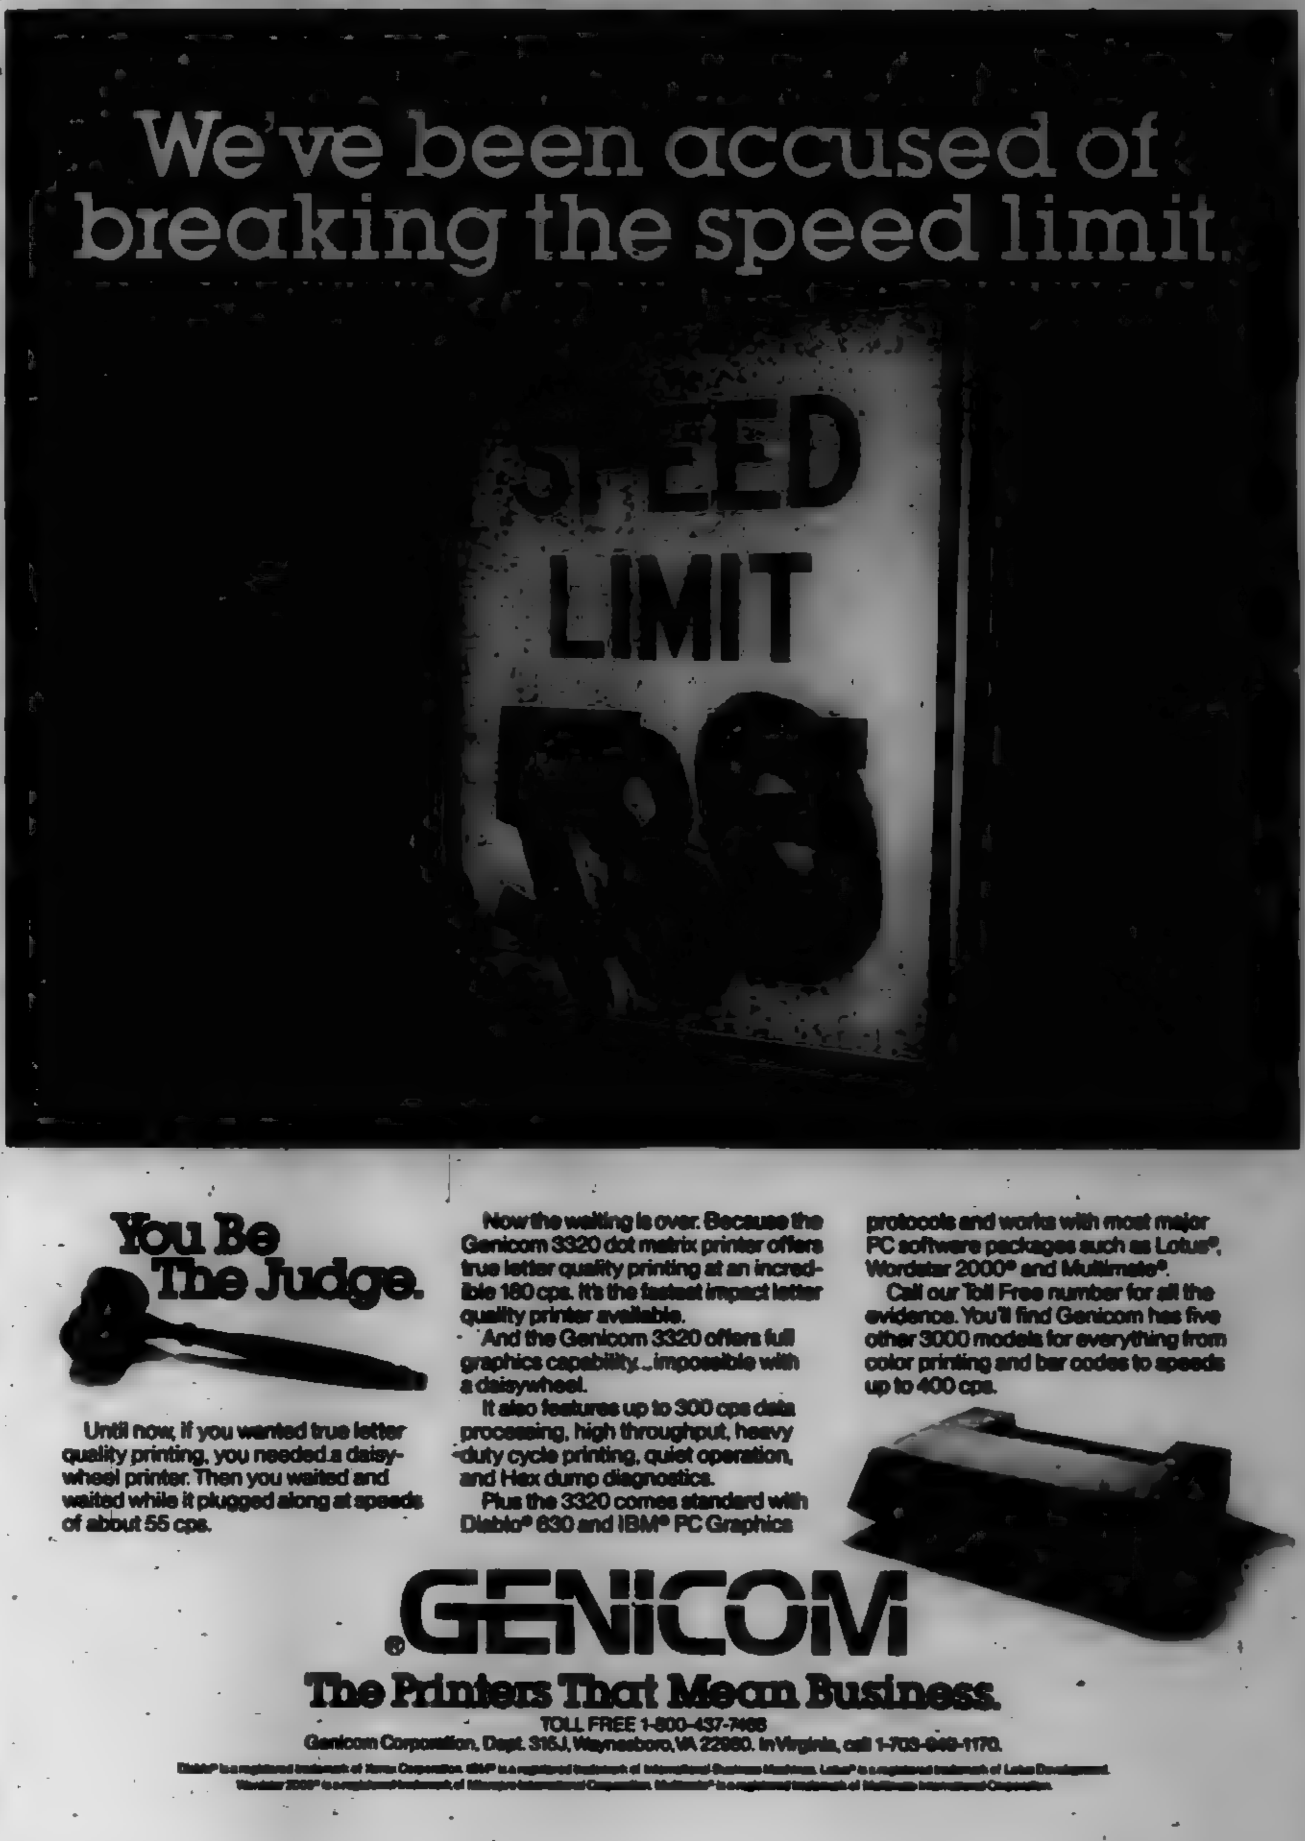
Capable of speeds in excess of 200 page/min and all-points addressable graphics, these behemoths revolutionized the high end of DP printing for very specialized markets. Banks, insurance companies, large retail outlets and other institutions with massive forms and billing needs turned to the high-speed laser printers and were willing to pay $300,000 and more for each machine.

According to Pesko, most Fortune 1,000 companies already have one of these machines in place, and when volume grows, they simply buy another. They often turn out between 1.3 million and two million prints per month. "You need someone full time just pushing paper through them," he says.

Although these machines pumped out paper, they had little flexibility and showed little promise for moving out of the centralized environments. They did, however, give DP managers a taste of what lasers could do.

"Lasers have a strong position in the centralized environment," Pesko says. "They

See PRINT UPDATE/12



We've been accused of breaking the speed limit.

You Be The Judge.

Until now, if you wanted true letter quality printing, you needed a daisywheel printer. Then you waited and waited while it plugged along at speeds of about 55 cps.

Now the waiting is over. Because the Genicom 3320 dot matrix printer offers true letter quality printing at an incredible 180 cps. It's the fastest impact letter quality printer available.

And the Genicom 3320 offers full graphics capability...impossible with a daisywheel.

It also features up to 300 cps data processing, high throughput, heavy duty cycle printing, quiet operation, and Hex dump diagnostics.

Plus the 3320 comes standard with Diablo® 630 and IBM® PC Graphics protocols and works with most major PC software packages such as Lotus®, Wordstar 2000® and Multimate®.

Call our Toll Free number for all the evidence. You'll find Genicom has five other 3000 models for everything from color printing and bar codes to speeds up to 400 cps.

PRINT

from UPDATE/11

are well over the pioneer stage, and their reliability is known. The interest started at the top and is moving down."

These high-end machines have not truly driven the nonimpact printer market, however. Though IBM and Xerox have enhanced their products over the years, the technology has remained of the plain vanilla variety, and the prices have not come down.

The Xerox 9700 actually has more flexibility than the IBM 3800 because it allows dual-sided, cut-sheet printing, but many industry analysts believe that the high-end market is saturated.

"I don't think that IBM and Xerox between them have sold more than 3,500 units in all this time," declares Datek's Dower. "That's because [the units] cost $300,000 and were being sold into very specialized environments. Once IBM and Xerox sold to all those people, there wasn't much of a market left to sell. By and large, at that end, there has been no change."

Joscelyn tends to agree. Users in large sites, he notes, are facing the same issues as they did over the last five to 10 years. The 9700 has added more functions and more clarity, but its cut-sheet paper, while an advantage in some environments, has caused problems for others.

"Users have complained that handling and distributing that paper is more difficult than fanfold [paper]," he explains. "They need some kind of binding mechanism."

Xerox's Kiel nonetheless denies that the market has been saturated and points out that shipments for the 9700 have increased over the IBM 3800 because of its ability to do cut-sheet and duplex printing.

"It's an interesting phenomenon," he says. "I would have thought that by 1982, that market would be saturated. But we are finding that the technology is so well accepted that, as people are starting to replace their older printers, they are going straight to nonimpact technologies. Our activities for the 9700 have not slowed down at all."

Kiel

Pesko adds that he expects IBM to unveil a cut-sheet option for the 3800 sometime this year.

While growth in printed page volume in the data center is expected to be relatively low (perhaps 5% to 10% annually), a trend toward nonimpact technologies in that environment is anticipated.

Consultants agree that ultra-high-speed workhorses like the 3800 and 9700 will continue to reign as the machines of choice. The real dogfight will commence between lower speed laser printers — such as Xerox's 8700 and IBM's 6670 — and the entrenched line printers.

The middle ground

As the market moves down into remote printing departments, distributed DP sites and office clusters, the confusion factor for printer purchases increases. It is in this battleground that DP managers face the hardest choices between impact and nonimpact machines.

A reported 55 vendors now offer nonimpact page printers, and 85% of those products were introduced in the past two years. As vendors such as IBM, Xerox, HP, QMS, Inc. and Southern Systems, Inc. unveil more products, the DP manager is inundated with, and must make sense of, a number of technologies and machines.

This segment of the market is particularly confusing because there is so much price/performance overlap.

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in over 25 countries is the largest in existence. Over 9,000,000 computer-involved people around the world rely on our publications for the information they need to stay ahead.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diana La Muraglia today if you want to reach the computer buyers in any of the following countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom, Venezuela and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

from UPDATE/12

According to Pesko Associates, printers in this environment operate at speeds between 35 and 80 page/min and currently cost between $40,000 and $100,000. But above the desktop level, there is a large number of machines in the 12 page/min to 24 page/min range being installed.

According to Dataquest's Steiner, "The trend we are seeing is that old line printers are still doing their jobs, but the DP managers are getting more involved with nonimpact printers and have installed one or two. Not the 9700 or 3800 type, but the 12 [page/min] to 20 [page/min] class is being installed in the data center, and people are learning how to use them to serve the client base. They are learning how to put out, not tons of greenbar [paper], but product with graphics."

While IBM's 6670, introduced in 1979, and the yet-to-be-shipped 3820 take on the Xerox 8700, 5700, 2700 and new 3700 and HP's 2680, the entire lot must struggle against the matrix line and band printers for acceptance. And trying to find a share of the crowded market are alternative technologies such as ink-jet printing, thermal transfer and ion deposition. It will not be easy.

"It is very hard for a new technology to establish itself in the market," Dower says, "particularly when there are enormously strong technologies against which it competes. And nonimpact page printers really require a whole new set of application software and application understanding, which didn't exist in the past."

Clearly, the uncovering of new applications that impact printing cannot handle will drive the nonimpact printer market. Corporations are beginning to consider the benefits of bringing into the data center more of the corporate publishing requirements now that they have affordable, flexible machines. The external printing bills for newsletters, forms and reports have traditionally been astronomical. High-speed page printers, which are underused in their new settings, are being put to use for in-house publishing.

"The growth of the electronic printing and publishing segment [of the market] will require a significant market development effort," states a report on nonimpact printing from Pesko Associates. "Electronic printing systems will begin to replace existing printing and duplicating equipment for both in-house and commercial printing. These new systems will offer substantial labor savings by displacing many manual steps in the traditional prepress, press and postpress areas. Consequently, electronic printing systems will represent a revolutionary change in the entire way in which printed matter is produced."

The low end

As laser technology has made its way to the desktop, it has gained more attention than ever. Drops in speed and price and improvements in electrophotographic techniques have suddenly spawned a new and exciting market.

The Japanese have dominated the middle and low ends of the laser marketplace because of their advanced photocopying technology, upon which laser printing is based, and automated manufacturing capabilities. Steiner of Dataquest suggests that a multicolor laser printer will emerge from Japan within the year.

Consultants point out that if a laser printer is not entirely made by a Japanese vendor, its engine almost certainly is.

Not surprisingly, therefore, it was Canon U.S.A., Inc.'s LBP-CX personal nonimpact page printer that turned the industry on its ear when it was introduced in late 1983. Though Canon did not begin to ship its own printers until earlier this year, it sold the product through OEM agreements. The machine cost less than $10,000, a figure seemingly unattainable heretofore. Canon broke new ground in price/performance for laser

See PRINT UPDATE/14

If you buy a TI 855 printer now, you won't have to upgrade to one later.

Don't tack just any printer on your new PC for now, thinking that you'll get what you really need later. Start with the best, a TI 855 or TI 865 printer. That way you can put the money you'd have spent on a needless upgrade on some other smart investment.

You see, our OMNI 800™ Model 855 is actually three printers in one. For word processing, it delivers letter-quality printing that rivals the best daisy wheel printers around. For data processing, it prints at 150 characters per second. And for your graphics, it reproduces screen or monitor images in the finest detail.

Of course, these advantages are all true of our TI 865 wide-carriage printer, too.

What's more, since our printers are among the easiest to use, you can utilize all the capabilities built into your PC and software right from the start. Instead of sometime later. You even have a choice of over 30 different plug-in type fonts, any three of which can be printed on the same page without ever stopping the printer! Just touch the control panel and it happens. Simple. So every document looks just the way you want it to. Professional.

As for reliability, TI printers are legendary. Just ask any major airline.

So don't downgrade your PC's performance with a printer you'll outgrow in a month. Get yourself a TI 855 or TI 865 printer now. It's easy. Just call 1-800-527-3500, ext. 801, for the TI Dealer near you.

Update

Advanced components drive printer mart

By Maureen E. McManus
Special to CW

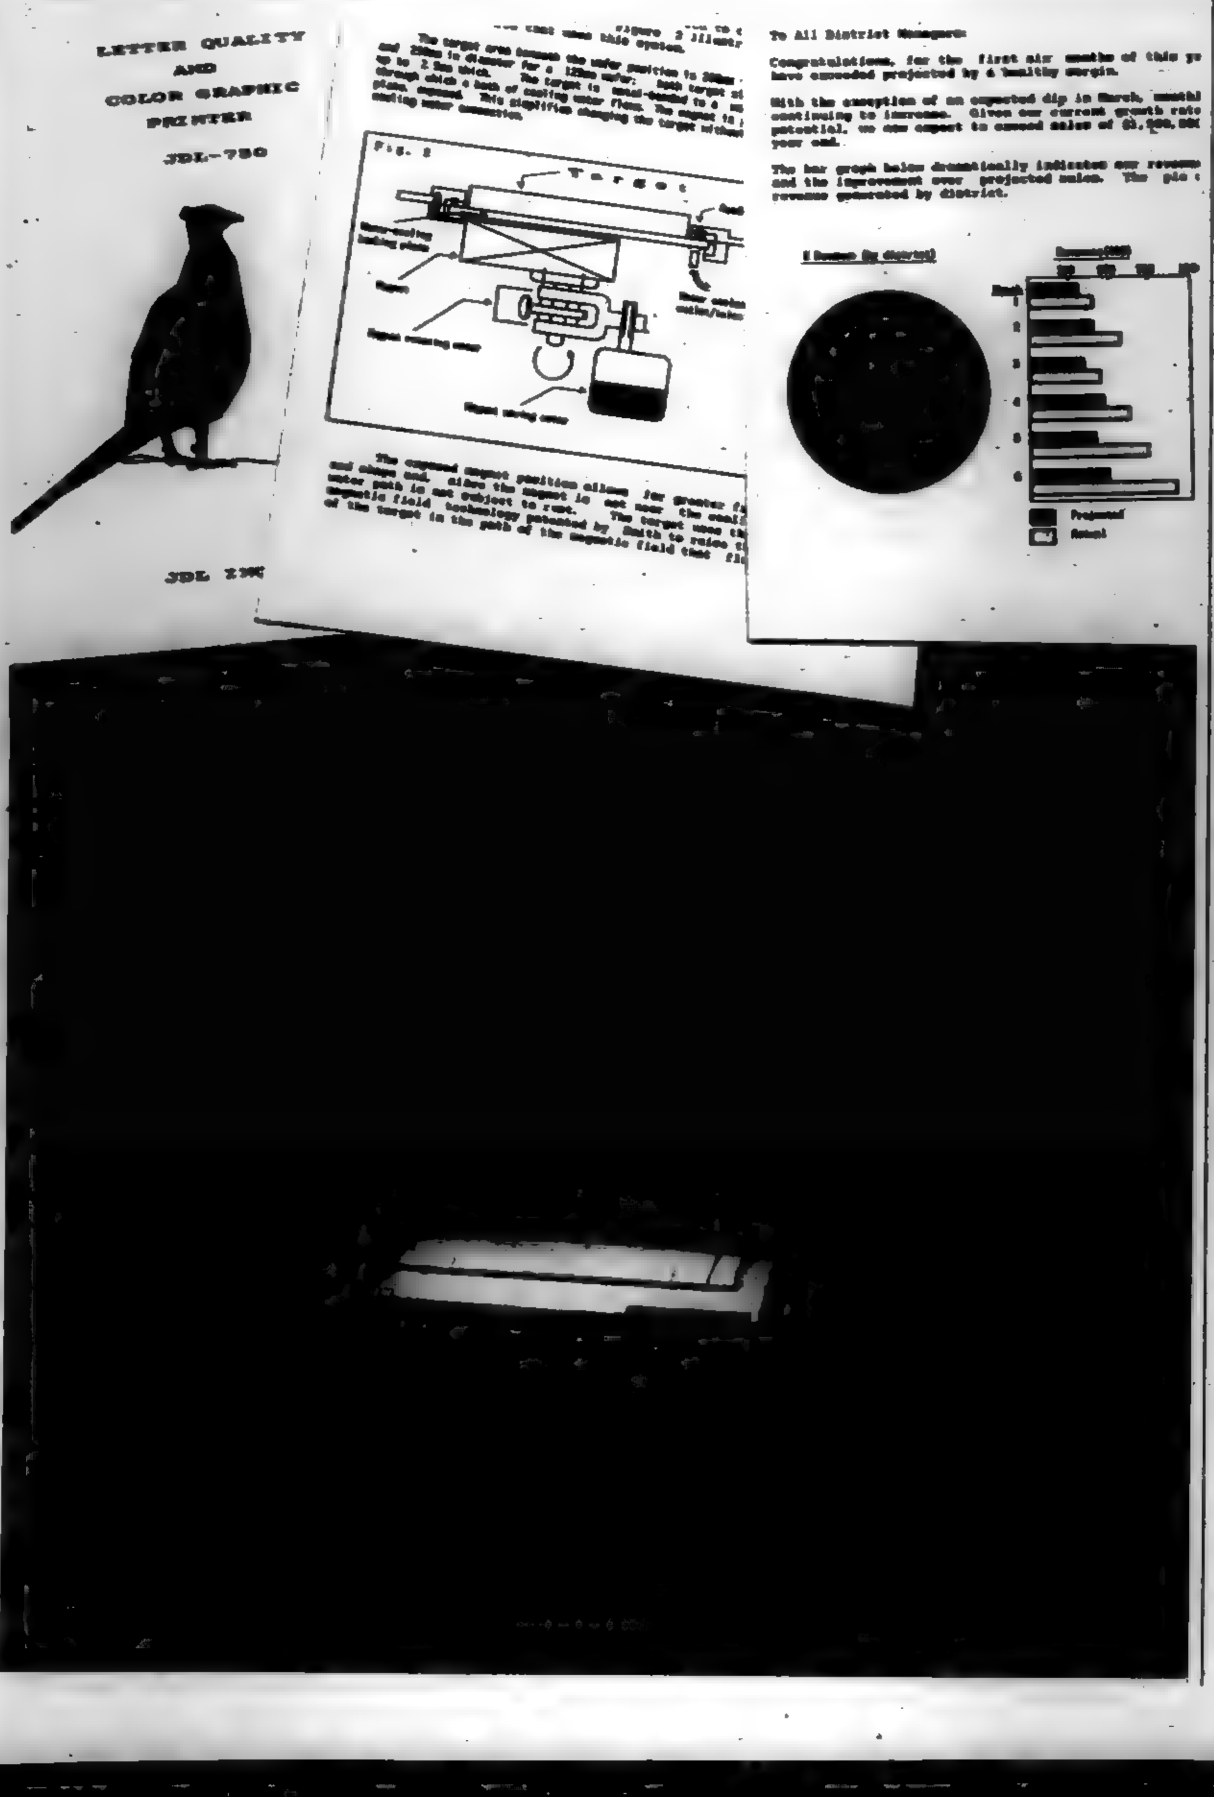
The term "page printer" has been confined to monolithic page printing systems such as the Xerox Corp. 9700 or the IBM 3800. These $325,000-plus monsters printed a page at the blink of an eye and chewed up over one million pages per month operating on the "click, click, click" method. Every time it clicked the image, the end user paid. The footprint was the size of a truck, and undoubtedly the driver was a DP operator. Unquestionably, the technology was laser.

A great deal has changed, giving users a multitude of hard-copy options to fit their specific needs. Much in the same way that their host systems preceded them, page printers began their descent toward distributed printing with the advent of machines like the Xerox 2700, a 12 page/min laser printer costing approximately $20,000. Hewlett-Packard Co.'s Laserjet practically leaped into the laps of the end user in 1984 as the foremost vendor in a line of Canon U.S.A., Inc. LBP-CX OEMs. Price tags on this new generation of lasers run as low as 1% of their forefather's cost, and vendors such as

See MCMANUS UPDATE/23

McManus

McManus is the manager of the printer market program for International Data Corp. in Framingham, Mass.



PRINT from UPDATE/13

printers and began to drive the low-end market it had spawned.

Canon also decided to sell its 8 page/min print engines to U.S. vendors who wanted into the market but did not have the time or money to invest in internal development. Canon engines already can be found in products from nearly 20 U.S. vendors, including Apple Computer, Inc., HP and QMS. It was HP's Laserjet, introduced in 1984 for $3,500, that proved that the technology really could be had for less than $20,000.

The desktop laser printer is unquestionably a product to be reckoned with. Its ability to print text and graphics on the same page, quiet operation and multifont printing on a single page are all attributes. "They appeal to the artist within us," HP's Ulfers adds.

New forms of laser technology are also appearing as companies jockey for position and advantage. Liquid crystal shutters and LEDs are being used as alternative ways to send the light source to the paper.

The desktop laser printer is not a panacea, however, and it has a long way to go before it can compete with the serial dot matrix machines. The Canon LBP-CX engine, for example, has a duty cycle of only 3,000 page/mo, which is considered extremely low by impact machine makers. There is also a need for new software to drive all the LBP-CX's capabilities. In addition, laser printers tend to be less reliable than impact printers.

Although $3,995 is a remarkable price for a laser printer, it is still high for the low end. Xerox's Kiel predicts that the price will drop to the $1,500 to $2,000 range by 1987, but the low-end laser printer will need acceptance as a shared peripheral to get into corporate America.

Apple has taken the desktop laser printer to another plateau. Its Laserwriter, introduced earlier this year as part of the Macintosh Office system, is also based on the Canon engine but goes a few steps beyond the Laserjet. At $6,995, it is significantly more expensive than the Laserjet, but it offers multiple professional typefaces; full-page, high-resolution graphics; and new ways to lay out text and graphics on a page using Postscript, a programming language for page description.

See PRINT UPDATE/16

Dataproducts

370 computer companies have discovered the secret to building some of the world's most advanced printers.

[illegible]

Update

PRINT

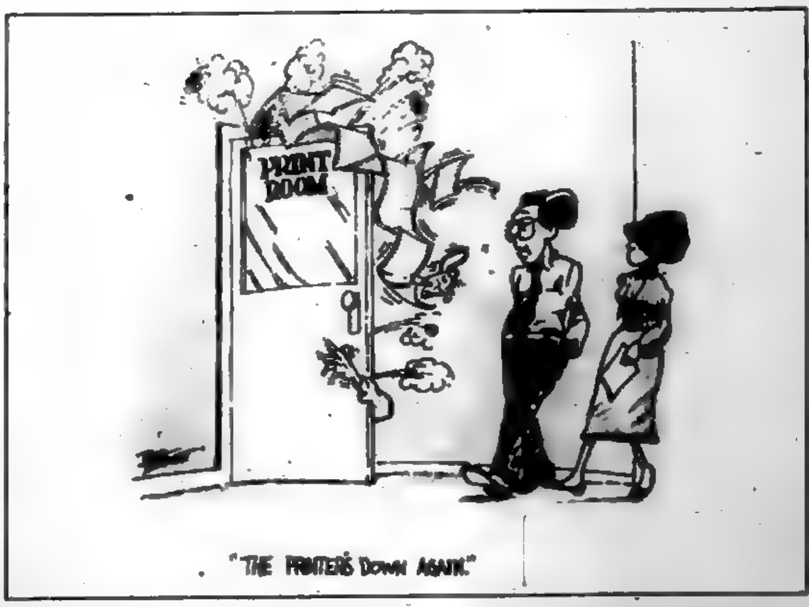
from UPDATE/14

The Laserwriter also incorporates a Motorola, Inc. 68000 microprocessor, as does Apple's Macintosh, and, in fact, features nearly three times the random-access memory of a 512K Macintosh and 20 times the memory of the HP Laserjet.

According to Apple's Bruce Blumberg, product manager for Laserwriter, the product is attempting to change the standard for internal communications. In particular, it is attempting to address the question of where in-house publishing fits in the corporate organization. To date, the data center has shied away from in-house publishing, but increasingly, the margins between the two are blurring, Blumberg points out.

"We're providing the tools to allow people to do in-house publishing significantly cheaper, with a faster turnaround and better results," Blumberg says. "That's the kind of thing DP people are going to be increasingly involved with."

Steiner agrees and says he expects that Laserwriter-type technology will move up to the high end to allow DP shops to handle large in-house publishing requests. "There will be a lot of demand for publishing," he says. "As people get more and more into doing spreadsheets and graphics, they can pull out four or five pie charts and assimilate information more rapidly. If they can have that, why can't the president or vice-president have the same thing? It's not realistic to expect them to look through a stack of greenbar anymore."



"THE PRINTER'S DOWN AGAIN."

The Laserwriter has been extremely well received by consultants, but it too has drawbacks. Although it works well in its native Macintosh environment, it loses much of its capability with other systems, such as IBM's. Apple has turned to third-party software developers to try to solve that problem, and such companies as Microsoft Corp. and Studio Software have already developed driver programs to tie Laserwriter to the IBM Personal Computer.

In terms of in-house publishing capabilities, the Laserwriter is currently alone in the field. "Before this, you needed a $50,000 [Interleaf, Inc.] machine to do this kind of work," says McManus of IDC. "This is really a breakthrough product."

Xerox and DEC both introduced their answers to Apple's printer. DEC's LN03 laser printer uses a Ricoh Electronics engine and retails for $4,195. DEC's Bernard says that it is a more general-purpose machine than the Laserwriter.

As more companies plunge into the still-cold waters of low-end nonimpact printers, the outlook is optimistic but cautious. Says the report from IDC, "Lasers are expected to do well, with 1984 shipments of about 16,000 [increasing] to nearly 200,000 for 1989. Overall though, they are expected not so much to totally supplant other types of printers as to augment a business' varying personal computer printing needs."

Ink-jet technology

The nonimpact technology that is most likely to encroach upon laser territory is ink-jet printing. Ink-jet printers have been on the market for several years, but they have yet to show a commanding presence. Ink-jet technology, however, continues

See PRINT UPDATE/18

PRINTER SUMMARY

Impact

Technology	Type	Speed	Print Quality	[illegible]	[illegible]	[illegible]	[illegible]
Daisywheel	Serial	12 to 90 char./sec.	Excellent letter quality; sharp edges, no scallops	96 to 200 char./wheel; overstrike increases number of characters; graphics resolution to 120 by 96 dot/in.	Interchangeable fonts, low cost, good reliability	Slower speed than impact serial matrix	$600 to $6,000
Serial Impact Matrix	Serial	30 to 600 char./sec.	Draft to near-letter quality: 200 char./sec. draft, individual dots; 110 char./sec., scallops; 35 char./sec., near-letter quality, low uniformity and rough edges	Graphics resolution to 240 by 240 dot/in.	One printer for multifunctions; print quality changes with speed; color graphics possible; good reliability	Low resolution with sparse dot matrix	$250 to $6,400
Line Impact Matrix	Line	80 to 900 line/min.	Draft to near-letter quality; at 80 line/min., near-letter quality, low uniformity and rough edges	Graphics resolution 60 by 60 dot/in. to 160 by 160 dot/in.	One printer for multifunctions; print quality changes with speed; color graphics possible; good reliability	Low resolution with sparse dot matrix	$3,500 to $17,000
Drum	Line	300 to 2,000 line/min.	Utility to correspondence to optical character recognition(OCR)-readable	Fixed character set to 96; graphics only by printing characters	Heavy-duty printing with low maintenance; very good reliability; some print MICR* checks	No interchangeable character sets	$10,000 to $60,000
Chain or Train	Line	600 to 2,000 line/min.	Utility to correspondence to OCR-readable	Interchangeable fonts to 128 char./set; graphics only by printing characters	Interchangeable fonts; long life; good reliability	Chain or train track wear; more expensive and slower than band technology	$12,000 to $88,000
Band or Belt	Line	200 to 3,600 line/min.	Utility to correspondence to OCR-readable	Interchangeable fonts to 128 char./sec.; graphics only by printing characters	Interchangeable fonts; capable of heavy-duty printing; very good reliability	Entire band needs replacement if one character wears	$4,000 to $108,000

Nonimpact

Technology	Type	Speed	Print Quality	[illegible]	[illegible]	[illegible]	[illegible]
Direct Thermal	Serial and Line	18 to 300 char./sec., 200 to 450 line/min.	Draft to near-letter quality	Resolution 64 by 64 dot/in. to 90 by 90 dot/in.	Low cost; low noise	Requires special thermal paper; heads have limited life	$175 to $1,500
Thermal Transfer	Serial and Line	11 to 300 char./sec. 65 to 650 line/min.	Draft to near-letter quality	Resolution 70 by 70 dot/in. to 240 by 360 dot/in.	Uses plain paper; color graphics possible	Ribbon cost is fairly expensive, up to 30 cents/sheet	$199 to $2,000, serial; $2,500 to $12,000, line
Electro-erosion	Serial and Line	160 to 2,200 char./sec., 90 to 200 line/min.	Draft to utility — serial; photomaster book quality — line	Resolution: to 160 by 160 dot/in. — serial, 600 by 600 dot/in. — line	Fast and quiet — serial; high print quality for photomasters — line	Paper appearance is metallic and can wrinkle — serial; metallic appearance no problem for photomaster	$495 to $2,000, serial; $21,000, line
Ink-jet	Serial and Line	20 to 270 char./sec., 300 line/min.	Draft to almost letter quality	Resolution 60 by 90 dot/in. to 300 by 300 dot/in. to 224 by 480 dot/in.	Quiet; color graphics possible; relatively low supplies cost	Optimum printing on some with special papers; reliability on some not too good due to nozzle clogging	$495 to $22,000
Electro-static	Line and Page	300 to 11,000 line/min.	Correspondence to near-letter quality	Resolution 100 by 100 dot/in. to 400 by 400 dot/in.	High speed for printer applications; low speed for plotting to 72 in. wide; color available	Requires special dielectric paper and liquid toner	$5,000 to $165,000
Magneto-graphic	Page	10 page/min. to 30 to 90 page/min.	Near-letter quality	Resolution 240 by 240 dot/in.	Quiet; high speed; good reliability for nonimpact page printers	Lower resolution that electro-photographic	$2,800 to $25,000
Ion Deposition	Page	60 to 120 page/min.	Near-letter quality; uses pressure fusing, hence, a somewhat shiny appearance	Resolution 240 by 240 dot/in.	Quiet; high speed; better reliability than electrophotographic; can print MICR* for checks	Lower resolution than electro-photographic	$60,000 to $80,000
Electro-photographic	Page	8 to 214 page/min.	Almost letter quality	Resolution 180 by 144 dot/in. to 400 by 400 dot/in.	Ranges from quiet, low speed and inexpensive to very high speed, high volume and expensive but competitive cost per copy	Reliability lower than maintenance requirements and higher than some impact printers	$3,500 low-end to $400,000 high-end

A guide to cost-justifying smart nonimpact printers

By Charles A. Pesko
Special to CW‡

With a growing market creating more demand for intelligent copier/printers, potential end users need specific, accurate and timely product information. Along with speed, print quality, reliability and flexibility, cost of ownership is an important criterion by which to compare intelligent copier/printers to each other and to traditional impact printers.

An intelligent copier/printer is a nonimpact output device that accepts electronic input and produces hard-copy output of at least correspondence-level print quality. Examples of intelligent copiers/printers are the IBM 3800, Xerox Corp. 9700, Hewlett-Packard Co. Laserjet and Apple Computer, Inc. Laserwriter.

One feature that distinguishes the intelligent copier/printer from other printing systems is its internal capacity to create, format and manipulate many type styles and sizes within a document or within a page.

In some cases, intelligent copier/printers can merge text with graphics and images of great complexity. This process is under the direction of sophisticated, programmable controllers that can create electronic documents efficiently and economically.

There now exist many intelligent copier/printer products using several technologies. Each product offers its own set of features, format flexibility, host interfaces, print quality and speed. However, to make informed decisions, end users also require cost-of-ownership data based on an objective comparison.

Pesko

As part of the Intelligent Copier/Printer Market Requirements Service, C. A. Pesko Associates, Inc. has developed a cost-of-ownership computer model. By keeping major cost elements and assumptions consistent, useful comparisons can be made. The DP manager considering the acquisition of intelligent copier/printers for installation may use such a comparison in an in-house, cost-justification exercise. A cost-of-ownership calculation form is included below for use with these formulas.

There are four key elements and three minor elements in calculating cost of ownership. The major elements include the acquisition cost of the system, service/maintenance costs, usage charges and consumables.

The minor elements are floor space, electrical power and labor. Because of the extreme variability of the minor elements, we have excluded them from the model. However, the potential intelligent copier/printer end user would do well to consider these elements within the context of his company.

Configurations. Although each intelligent copier/printer has its unique constellation of feature/benefits, systems in our model are priced with configurations as nearly consistent as possible, as the following examples show:

- **Interfaces.** Interfaces are always included. Some systems offer no choice of interface. For those offering choices, be sure to price the interface compatible with your computers.
- **Paper trays.** Where the option is available on sheet-fed systems, use two trays or more in the pricing.
- **Fonts.** Fonts may be limited to those included in the basic package. If fonts are not included, add in the price for the minimum number of fonts required.

Amortization. Rental and lease rates vary considerably between vendors and third-party lease companies. When we consider nonpurchased equipment, we use two-year lease rates from the equipment vendor. The comparison of purchased equipment is made at quantity one end-user list price, amortized over 60 months. We disregard the cost of money on purchased equipment. However, we recommend that you consider it in your evaluations as it will, in many cases, diminish the cost advantage of purchased equipment.

Supplies

Supplies prices are taken from the equipment vendors' catalogues. For quantity discount purposes, prices are taken generally at the one-month usage level or at the first price break, whichever quantity is higher. In the centralized environment, volumes are usually high enough to qualify for the greatest discounts.

Production yield of a supply item can vary significantly between end users, and some supply vendors are more sanguine than others in quoting yields. Therefore, this analysis uses the production yield figures quoted by the equipment vendors.

Paper. Paper, like other consumables, varies in price according to volume. In the centralized environment, with more than one million prints per month as an average volume, we use the lowest average paper price as follows:

- **Cut sheet.** Cut sheet measuring 8½- by 11-in. at $.00425 per sheet.
- **Continuous form.** Continuous form measuring 8½- by 12-in. at $.00525 per sheet.

Average monthly print volume (AMPV). The cost of ownership of each system is examined at four evenly distributed AMPVs within the general volume limits of the centralized environment. In most companies, print volumes grow over time. Examine the results of increased volume on your cost per print.

Print speed. Vendors' published print speeds are used throughout the model. The average page may be assumed to be 40 lines of 60 characters each, for the purpose of converting lines per minute to pages per minute. In instances where equipment uses continuous-form paper and print speed was quoted in inches or feet per second, the model assumes the use of 8½- by 12-in. form, running on the 8½-in. axis.

Shift and duty cycles. For the centralized environment, printers are assumed to be available three shifts per day, 25 days per month. These figures were obtained through end-user research.

Based on quoted print speed and the total shift time described above, duty cycles were calculated for each AMPV. As a rule, intelligent copier/printer manufacturers recommend AMPVs work out to low-duty cycles for workstation systems and higher duty cycles in the high-end environments. The duty cycle can be calculated by taking

Update

IBM marshaling resources for printer mart offensive

By Glenn Rifkin
Update Editor

"IBM is getting very serious about hard copy," states Maureen McManus, manager of the printer market program for Framingham, Mass.-based International Data Corp. Indeed, IBM is no stranger to the printer business. Big Blue's band printers have been staples in DP centers for years, and its ultra-high-speed 3800 laser printer ushered that technology into the DP shop.

But now, IBM is gearing up to enter virtually every area of printer technology — from the high end to the low end, from impact to nonimpact — and that will undoubtedly spell trouble for many in the printer business.

Those with perhaps the most to fear are the Japanese printer makers in the low end of the impact and nonimpact marketplace. IBM has fully automated two of its manufacturing plants, in Charlotte, N.C., and Lexington, Ky., and is ready to turn out commodity products similar to what vendors like C. Itoh Electronics, Inc., Epson America, Inc. and Okidata Corp. have done so successfully for the past five years.

"IBM is going after the Japanese with a vengeance," says Charles Pesko, president of C. A. Pesko Associates, Inc. "And if anyone can compete with the Japanese, it's IBM."

It is at this low end, the personal computer printer market, that IBM will have the most impact. After being an OEM for Epson printers for several years, IBM decided it would be more profitable to go into the market alone. "IBM views the personal computer-related printer business as one of opportunity," says Dan Perez, manager of peripherals marketing in IBM's National Distribution Division. "The fact that in the last six or eight months we have announced four printers, at least three of which are totally developed and manufactured by IBM, is a visual expression of our commitment."

Perez

In May, IBM introduced its $549 Proprinter, a serial dot matrix unit that operates at three speeds and can be used for single-sheet or continuous-feed paper, multipart forms or envelopes. The Proprinter was designed and is manufactured at IBM's Charlotte facility.

The company also introduced the $745 Color Jetprinter, a buyout from Canon U.S.A., Inc. that uses four ink-jet nozzles to create seven colors for charts, graphs, spreadsheets or high-quality text. At the low end, IBM also offers its compact printer for $250; the $1,396 Quietwriter, which uses thermal transfer technology; the $1,795 Wheelwriter, a fully formed daisywheel printer with an integrated sheet feeder device; and a $1,995 color graphics printer, an impact printer that also originates from outside the company.

According to Pesko, IBM will add to its strength with a tabletop laser printer in the near future. That product, when it appears, is expected by some in the industry to do for desktop laser printers what the IBM Personal Computer did for personal computers.

As IBM gears up for the low end of the market, consultants expect a bloodbath for many of the smaller printer vendors who will simply not be able to keep up with the volume pricing of which IBM will be capable.

"A lot of companies will fall by the wayside because of IBM," McManus says. "Price erosion is just beginning."

Price/performance driving the market

Perez points out that he expects price/performance levels to drive the market. "Implicit in price/performance is reliability," he states.

"People want machines that stand up over a long period of time and require minimal repair. . . . the printer is really nothing more than the output extension of a computer and what you don't want is to be impacted on the computer end because of the output device."

IBM also has a strong interest in middle and high ends of the printer business. According to Jack Smulovitz, IBM's impact printer products development planning manager, the company has migrated all of its impact machines into band technology.

Having recently introduced its 4245 band printers [CW, May 13], with Models 12 and 20

See IBM UPDATE/22

PRINT from UPDATE/16

to draw praise.

"Lasers will get a considerable amount of pressure and competition from ink jet as ink jet finally gets the bugs out of it," says Steiner of Dataquest. "It will offer color more easily and cheaply than laser [does]."

"It's a fabulous technology," Dower adds. "But I'm not convinced it is going to sweep the country by storm."

Although it has a high-level print quality and can run at fast speeds, ink-jet printing has had minimal market penetration to date. There is still a question about its sensitivity to the media on which it prints — on rag or ground-wood-type paper, the ink tends to spread a bit before it dries — and reliability continues to be an issue.

Nonetheless, ink-jet printing has mustered enough support from major vendors such as IBM, HP, Epson and Diablo Systems, Inc. that it cannot be ignored. The technology got a big boost in 1984 when HP introduced its Thinkjet printer, which was priced so low ($495) and had such good print quality that the industry sat up and took notice. IBM put its stamp of approval on the market this year with its $745 Color Jetprinter, which it purchased from Canon.

HP's Ulfers points out that his company has made a strong commitment to ink-jet technologies, even more than it has to laser technology.

Although ink-jet printing has been tried at every end of the market, its strength appears to be at the low end. Diconix, Inc., an Eastman Kodak Co. subsidiary, is marketing a 20 page/min machine called the Office Ink Jet, and Dataproducts just announced a joint development agreement with Exxon Enterprises Printing Systems to produce a business computer printer using ink-jet technology. But it is unlikely that the data center market will face a rash of ink-jet products.

"Ink jet could become a major player," Dower says, "but the jury is still out."

Thermal transfer

This technology has gained significant attention at the low end of the market because it is extremely inexpensive. Okidata, for example, offers its Okimate 20 for less than $300.

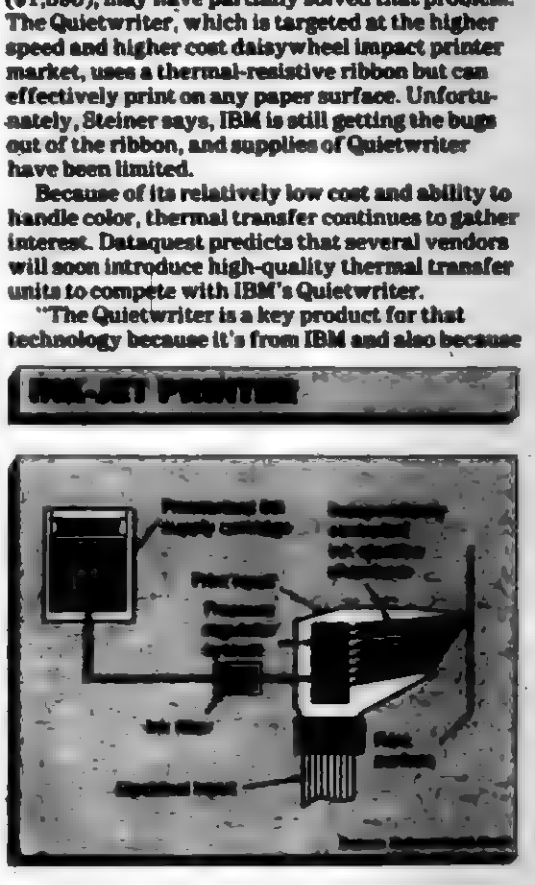
Unfortunately for thermal transfer technology, it generally requires the use of special thermal paper or, in some cases, a special thermal ribbon. That may be its biggest drawback. "One thing history has shown in the market is that users will do anything to avoid using special paper or supplies," Dower says. "They want to get paper out of the drawer and use it."

IBM, with its recently introduced Quietwriter ($1,395), may have partially solved that problem. The Quietwriter, which is targeted at the higher speed and higher cost daisywheel impact printer market, uses a thermal-resistive ribbon but can effectively print on any paper surface. Unfortunately, Steiner says, IBM is still getting the bugs out of the ribbon, and supplies of Quietwriter have been limited.

Because of its relatively low cost and ability to handle color, thermal transfer continues to gather interest. Dataquest predicts that several vendors will soon introduce high-quality thermal transfer units to compete with IBM's Quietwriter.

"The Quietwriter is a key product for that technology because it's from IBM and also because it can print on rougher surface paper," Steiner says. "You'll see more and more thermal transfer products like that in late '85 or early '86."

INK-JET PRINTER



Ion deposition

Ion deposition — another "new" technology that is actually 10 years old — has recently begun to win a small band of converts. Ion printing is a relatively simple procedure that uses an ion projection cartridge that produces an electrostatic image directly on a dielectric drum by projecting an array of charged particles. Characters are formed when the particles are projected in a dot matrix pattern to the rotating drum's surface.

Unlike lasers, there is no rotating mirror to direct the laser beam, and less heat is generated. There is also no toner recovery system (ion printing has a reported 99.7% toner transfer), and the drum is hard and durable (see chart Update/23).

With fewer moving parts and no need for a specialized environment, ion deposition printers have several advantages over lasers. Delphax Systems, Inc. of Westwood, Mass., which holds all proprietary rights to the technology, is trying to cash in on these advantages.

Delphax is an outgrowth of Dennison Manufacturing Co. of Framingham, Mass., and Canada Development Corp. and was set up to market ion printers and sell ion printer engines to OEMs. Several firms have bought into the technology, including Xerox, which recently purchased Canada Development's share of Delphax and plans to introduce an ion deposition printer in August.

Ion deposition currently targets the data center. Delphax markets its S6000 printer, a 60 page/min machine, to centralized environments and is ready to announce a 90 page/min version soon. Southern Systems sells the Mercurion 1, which uses the Delphax engine, to data centers.

"The response has been excellent," says Don Dooley, national sales manager for Southern Systems. "We've shipped 300 machines in two years, and we have the largest base of ion deposition machines out there."

Ion deposition printers — although incapable of duplex printing — are reportedly more

See PRINT UPDATE/19

PRINT from UPDATE/18

reliable than laser printers because they have fewer parts and procedures and cost less. The Delphax S6000 costs $60,000 to $80,000.

"[Ion deposition is] a potential player," Pesko says. "It can cover a broad range of applications in the centralized environment."

For Delphax, Xerox's interest has been a boon.

"Having Xerox as an investor certainly legitimizes the product," says Mark Casey, a product specialist at Delphax. "People realise that it's not some perpetual motion machine we cooked up in the garage."

Magnetographics

Magnetography uses magnets instead of lasers to create the image. These printers use a thin-film magnetic recording head to generate dot images on a magnetically coated drum. The head uses specially designed elements that let the printer place dots close together without magnetic interference.

As the drum rotates, it contacts dry monocomponent toner that adheres to the magnetic images. These images transfer to plain paper, and the printer heat fuses them to ensure that characters are sharp and distinct.

Consultants consider this technology, along with ion deposition, the most promising of the new printing techniques. Magnetographic printers have an advantage over other nonimpact machines in that they can store their own images and duplicate at faster speeds.

The market has been slow to accept this technology. Only Ferix Corp. in Sunnyvale, Calif., and Cynthia Peripherals, Inc., the U.S. subsidiary of Compagnie de Bull in France, sell magnetographic printers. Their products, like those of Delphax, are aimed at the high-speed market. Ferix, however, has encountered difficulties and recently laid off half its work force.

"They are at a stage a lot of start-ups get to. They are two steps from what might be success, but it gets very expensive," Steiner says.

The buying decision

Deciding what printer to buy used to be relatively simple for the DP manager. The technologies were few and clearly differentiated. Price/performance determined the selection, and like all peripherals purchases, the decisions were never considered high priority or critical.

Today, the buying decision is considerably tougher, and the lines between technologies have blurred. The questions that a buyer must

See PRINT UPDATE/23

COST from UPDATE/17

the recommended print volume and dividing it by the total number of prints produced theoretically if the machine ran constantly. The highest duty cycles are in the centralized environment and average about 35%. A few vendors go as high as 45%. Higher duty cycles are a feature of impact printers.

Multiple units. The end user's decision on how many units of a printer are needed is based on volume requirements, acceptable downtime and cost of ownership. In many cases, these price structures offer the intelligent copier/printer user a strong financial incentive to add units rather than to exceed a given AMPV.

Service/maintenance contracts and usage charges. The cost of the individual service contract on each specific system is included in the model. It is recognized, however, that many large end users have blanket contracts, with full-time, on-site personnel servicing a variety of equipment.

The highest level service/maintenance contracts available — guaranteed on-site within four or eight hours — were chosen on the assumption that these systems are used in locations where extended downtime is unacceptable.

Vendors approach usage charges in one of the three following ways:

- Flat rate per "click" regardless of volume.
- Graduated charge, based on volume increments.
- No usage charge. ■

Save the

Millions of IBM PCs and compatibles are fighting for their lives.

Because users are demanding more and more storage space.

For bigger programs. For more applications. For downloading from the mainframe to the micro.

It's really more than a little PC can cope with.

Which is why a lot of people are replacing their PCs with XTs.

But now you can put an end to this senseless economic waste.

And save your company the massive cost of buying all those XTs.

With Hardcard.

A 10 megabyte hard disk drive on a card that makes a PC* function exactly like an XT. In fact, the only difference is that Hardcard has a faster access time than the XT's built-in drive.

It's also faster to install than any other add-on drive. Because everything is compressed onto a single card that quickly plugs into any expansion slot inside the PC. Which means you can rescue hundreds, even thousands of PCs in a day.

And with Hardcard's special installation software, your users can load the operating system and be ready to install their programs in minutes. Which saves your technical staff a lot of support time.

Hardcard also saves all that money you've invested in software. Because it runs all the most popular programs exactly like an XT would. With no extra fuss or modification. And its built-in file directory lets users arrange their files anyway they'd like. So they can boot up any application at the touch of a key.

As for reliability, there's simply less to go wrong. Because Hardcard has fewer parts than other drives. And absolutely no cable connections. Which makes it twice as reliable as the XT's built-in drive.

And Hardcard is the only add-on drive that lets your users keep both their floppies up and running.

But perhaps the most reassuring thing about this revolutionary

PCs.

concept is that it is based on totally non-revolutionary technology: the Winchester hard disk.

In fact, Hardcard was created by some of the same people who pioneered the 8" and 5¼" Winchester drives. And their company has a long history of producing reliable drives for some of the biggest computer manufacturers in the industry.

Because of Hardcard's superior reliability, we can offer you a warranty that goes well beyond the usual 90 days. We give you a full year. Should anything go wrong within the year, take it to your nearby authorized service location, and you'll get a replacement Hardcard. Immediately. Which means little to no down time.

And the price? Affordable enough to turn all your PCs into XTs.

Hardcard will be available during October at your local computer dealer. In the meantime, write for more information:

Plus Development Corp.,
1778 McCarthy Boulevard,
Milpitas, CA 95035.

And do your part to save these friendly, intelligent little machines.

*Hardcard is compatible with IBM PC, IBM PC XT, Compaq Portable, Compaq Plus, AT&T PC 6300.

Plus and Hardcard are trademarks of Plus Development Corporation. IBM, IBM PC and IBM PC XT are trademarks of International Business Machines Corporation. Compaq Portable and Compaq Plus are trademarks of Compaq Computer Corporation. AT&T PC 6300 is a registered trademark of AT&T Information Systems, Inc.

Update

JAPAN from UPDATE/5

the Western markets could be served by the same head design.

Thermal transfer printer development was highly emphasized in Japan because of its potential to provide reliable, quiet, low-cost devices with a choice of color or monochrome printing. The U.S. market did not respond quickly to the thermal printer offerings because of the smooth paper required. IBM, however, responded to the challenge by introducing the Quietwriter printer.

The Quietwriter uses a different approach to thermal transfer printing called thermal resistive ribbon printing, in which the ribbon and not the head heats up. Also differing from the Japanese approach, IBM's thermal resistive ribbon, rather than the traditional waxed-base ink, transfers thermoplastic to paper.

IBM was able to use the thermal resistive ribbon approach, coupled with a complex head design, to print high-quality text on a wide variety of common office paper types. Japan is responding with several new products. Okidata has been successful in opening the low-cost personal thermal transfer printer market with the Okimate series offering color at a very reasonable price.

The latest Japanese influence on the U.S. printer market has been in the lower speed segments of laser printers. Canon U.S.A., Inc. certainly broke this market wide open with the introduction of the LBP-CX. The popular Laserjet printer from HP is based on the Canon print engine.

Prior to Japan's entry into the laser printer arena, there were no offerings less than $19,000. Now the price for 8-page/min laser printers averages approximately $2,800 for text-based devices. Dataquest expects these prices to drop to approximately $2,000 by mid- to late 1986.

Most of the Japanese influence on the U.S. printer market has been concentrated on the lower speed, high-sales volume devices. Japan has become a formidable competitor in this market.

Several U.S. vendors have successfully responded to the challenge, but Japanese firms claimed more than 70% of personal computer printer shipments in 1984. They brought cost-effective printing devices to personal computer and distributed processing users.

At the high end, Japan has had little or no influence on the higher speed electronic printer market in the U.S. To date, these market segments have not offered the opportunity for volume or mass-production cost savings.

The level of support required in these high-speed markets is also a barrier to entry, and Japanese vendors would have to have a much stronger U.S. presence to create a solid image in the market. Overall, however, there is no discounting the immense effect Japan has had on the electronic printer industry in the U.S. and in the world. ■

IBM from UPDATE/18

capable of speeds of up to 1,200 line/min and 2,000 line/min, respectively, IBM has a fully granular product line to offer.

At the top is the 4248, which operates at 3,600 line/min, and at the lower end, the 3262 and 5262, each with speeds of 650 line/min.

When announcing the 4245, IBM also announced a 25% price reduction on the 4248 and a one-year warranty on both the 4248 and 4245 models.

"That is a key point because we feel it is a statement of leadership and quality from our standpoint," said Smulovitz about the warranty.

In the middle and high-end areas of the nonimpact printer market, IBM continues to successfully sell its 3800 laser printer, a $315,000 machine with speeds up to 215 page/min, as well as its 6670, which operates in the 36 page/min to 80 page/min spectrum.

The company has announced, but not yet shipped, the $28,000 3820, a high-speed laser printer operating at 20 page/min.

Big Blue also markets its $21,000 4250 electroerosion printer for document processing and publishing applications.

For IBM, this blanket coverage of the printer market is aimed at providing application solutions for all its customers. Smulovitz indicated that IBM has no interest in taking sides in the impact vs. nonimpact debate. "The market is application driven," he explained.

"Different technologies address different applications. If you look at the total cost of ownership, nonimpact will have to exceed the price/performance [levels] of the impact printers in order to displace them, and we've just set some very aggressive numbers to shoot at. But there are applications that drive both sides."

Although no one at IBM will get specific, both Smulovitz and Perez acknowledged that IBM is looking into many of the alternative printer technologies. "IBM evaluates any technology that has potential," said Smulovitz.

For the competition, IBM's aggressive stance on printers is essentially no different from its positioning in virtually every other computer-related market. And as the market knows, I-B-M usually spells trouble. ■

We've Heard Rumors That The Guys At H-P Are Experimenting With A Way To Make Their LaserJet As Smart As Our SmartWriter.™

You can't blame them.

There's a chance their customers will think they've gotten the most intelligent, most versatile desk-top-size, nonimpact printer on the market.

When, in fact, they may not have heard about ours. The remarkable QMS® SmartWriter.™

Whoops! This could lead to some very embarrassing questions, such as:

"Will your LaserJet Printer support QUME,® Diablo,® Epson,® and ANSI X3.64 escape sequences? The SmartWriter will.

"Does it have more than the two standard fonts I already know about? The SmartWriter has seven.

"Does it support a parallel interface? The SmartWriter does.

"Will it intermix fonts on a line or a page without expensive options?

"Will it reverse image or boldface fonts?

"Will your LaserJet Printer support overlays, draw lines and boxes, subscript and superscript?"

We can hear their answers now: "Uh, no." "Not really." "Not quite yet." "Sort of." "Almost. Can you wait just a few years?"

Well, you could do that.

In fact, you could wait a long, long time for the guys at H-P® to come up with something that's got as much brain power as a QMS SmartWriter.

Or you could go ahead and get a QMS SmartWriter. Right now.

Call us at (205) 633-4300. Or write us at P.O. Box 81250, Mobile, Alabama 36689. And we'll give you a lot more information. No rumors this time. Just facts.

QUALITY MICRO SYSTEMS
WHERE IMAGINATION LEADS™

[illegible]

MCMANUS

from UPDATE/14

Kyocera Corp. offer cabinets smaller than a bread box.

Currently, laser technology dominates page printers, with desktop laser printers representing about 99% of the year-end 1984 U.S. shipments of about 38,000 page printers. But many alternatives — such as ion deposition, magnetographics, liquid crystal shutters, LEDs and CRT printers — are emerging to seek a market share in the next few years. At the heart of these machines, the resident controllers and software are becoming more plentiful and powerful, enabling printers of all technologies to perform advanced functions. Vendors are opting for a modular approach, externally sourcing components if necessary, at least initially, to meet their product's market window.

There are three basic components that make up the majority of page printers: the marking engine, controller and resident software. In the past, the market centered around the print engine. The Japanese dominate the low-end, print-engine market, which has essentially become a commodity.

Today the focus and driving forces behind the exploding page printer marketplace lie in the intelligent controller and the software or page generation languages. The raster image processor (RIP) controller houses the printer's intelligence and storage. This computer within the printer performs all the necessary computing — vector-to-raster conversion — and handles the massive amounts of storage requirements needed in generating graphics.

As evidenced in the QMS, Inc., Imagen Corp. and Apple Computer, Inc. controllers, based on the Motorola, Inc. 68000, these are hardy boards in their own right. These internal controller boards enable the host CPU to save its power and memory so that it does not become a slave to the output device. Controllers encompass a wide range of power and capabilities proportionate to price.

In addition to the printer and system makers involved in controller development, such as Xerox, Apple, HP, Imagen and QMS, there have been a number of independents popping up in the last few years such as EMC Corp., Intran Corp., Office Automation Systems, Inc. and Lasergraphics, a vendor that specializes in these rasterizing computers for color printers.

Another highlighted issue in page printers is the emergence of page generation languages. Currently, no real standard has yet been set in this arena, so this will be an interesting part of the market to watch.

The development and digitizing of the typesetting fonts these languages produce is extremely difficult and only two success stories have been written thus far. A few years ago, several former Xerox employees set off on their own and formed Adobe Systems, Inc. in Palo Alto, Calif. They wanted to pursue a purer vision of an interpretive programming language.

That pursuit has resulted in Adobe's Postscript language, which takes a font solution approach — storing its sets as a formula or outline. In this way, they are not locked into addressing every character or size change on a bit-by-bit level, thus saving time and money. Adobe Postscript is both device and resolution independent. Adobe's market is the same one Xerox has been targeting for its Interpress protocol.

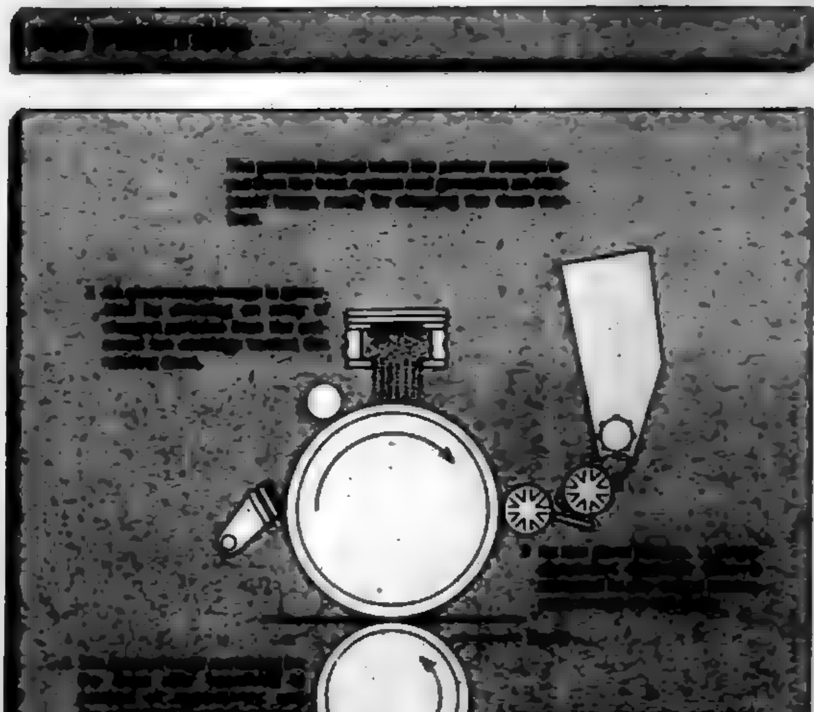
Currently, Apple is the largest Adobe Postscript user. Linotype and QMS have also signed agreements, and other major vendors are reportedly close to reaching accords as well.

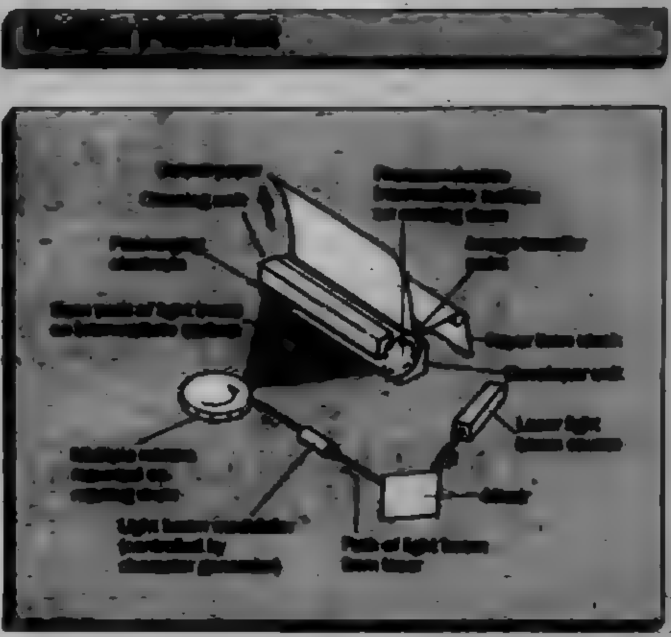
The Xerox Interpress Printing Architecture, introduced in April 1984, incorporates all of the Xerox Network Systems protocols required for printing documents on Xerox printers. The initial layer of these protocols has been publicly available since 1981, and the new Interpress architecture provides a way for different vendors to use common programs to link their products with each other and with a variety of electronic printers. It reportedly allows users to create documents in any layout and combines any number of line graphics, half tones, scanned images and text.

A key element in the Interpress architecture is the Interpress document format language. In the battle between Postscript and Interpress, Xerox has just won a major victory with the announcement of support from 19 companies, including such printer heavyweights as Digital Equipment Corp., Burroughs Corp., Siemens AG, Imagen, Dataproducts Corp. and Interleaf, Inc.

This sophisticated software and components, as stated, are truly the heart of the new wave of nonimpact printers. Depending on the price/performance target market, the wise vendor must carefully match the appropriate pieces at the right time. This requires a lot more understanding, commitment and support in the areas of software, services, distribution, training and marketing of these advanced-function page printers than is required for a volume commercial market of cameras or marking engines. This possibly explains why there has been such a long period of time between the debut of the concept and the shipment of products to the marketplace.

While the Japanese have the technology and marking engines, they do not have, nor do they seem to want, the distribution channels and all the software and support issues that are enveloped with it. Their strength and understanding lie in volume production. They can bring to market a mechanism but not the solution that is needed. Thus the focus on intelligent controllers and page generation languages brings, at least for the time being, the attention and money back to an American market.





It was Apple with its $6,995 Laserwriter that put all the pieces together with their 68000-based RIP controller and the adoption of Postscript. In a way, the Laserwriter may have already performed its most important market function by promoting user awareness and feeding off the business ego.

Once one end user distributes his presentation, generated on a Laserwriter-like device, to the board of directors, you can bet that is how fellow workers will prepare their reports next month. The Laserwriter is only the first step in a new generation of products that will be faster, more functional and capable of much greater volumes, which enables them to operate as shared resource printers. Nonimpact page printers will change the way business views and accepts its hard-copy output. ■

PRINT

from UPDATE/19

ask have not changed; there are just more of them on the list.

The No. 1 question, consultants and vendors agree, is, "What application do I have to fill?" The application, more than anything else, will dictate where the buyer looks. For the high end, price/performance along with speed continues to be the major concern.

Another question is whether to go with cut-sheet paper or continue with old-style fanfold paper. Currently, graphics and color are still considered luxuries, but according to HP's Ulfers, those features will become mandatory within a couple of years.

In decentralized environments and office settings, print quality, noise, ease of use, reliability and volume are paramount. A major concern for DP managers is putting the right machine in the right location. Overuse or abuse is a serious problem for users who are constantly frustrated by continuous downtime. Although vendors are pressing their sales representatives to point out the correct volumes and uses of their machines, abuse continues and often gives products an undeserved bad name. Temperamental machines, on the other hand, will inevitably begin to gather dust as users shy away.

Although impact printers are expected to remain a viable technology, most industry watchers anticipate that the next generation of computing will turn almost exclusively to the sophisticated, nonimpact offerings. If it comes to pass, it will require a lot of sociological changes, according to Ulfers. Until then, the paper chase will continue. ■

We've got thousands of micro communications problems your solutions can fix.

Micro communications is one of the biggest challenges that MIS/DP professionals face today. And that's the problem we'll be addressing in the September 25th Computerworld Extra!

We'll be dealing with all the issues corporate buyers must face. And answering their questions. On micro-to-mainframe links. PC networks and networking software. Gateway software for SNA and Ethernet. Service and support.

We'll take a look at how PCs can function as dumb terminals and intelligent terminals. And help the reader make an intelligent choice.

We'll have a global overview of how micros are fitting into the big picture.

And right in the middle of all this critically-needed information, you can place your ad. Where it will be seen by our 128,000 paid Computerworld subscribers. Plus all our extra pass-along readership.

So if you've got a micro communications solution, our Extra! can supply the people with the problem. And the money to buy a solution. The September 25th Computerworld Extra! on Micro Communications. But hurry, the closing is August 16th.

Call Ed Marecki, Vice President/Sales, at (617) 879-0700 or your local sales representative to reserve your space today.

IN DEPTH

Three views of voice/data integration

In the new world of voice/data integration, experience is crucial. These three have it. David Rappaport, a partner in Arthur Andersen & Co., is responsible for the firm's telecommunications consulting practice worldwide. Ralph Krichbaum, manager of technical consulting at Westinghouse/CSI Communications, provides corporate guidelines and consulting on networks and equipment. Roy Weber, director of the Systems Architecture Center at AT&T Bell Laboratories, oversees the user-interface layers of AT&T's evolving Systems Architecture.

The three were brought into dialogue by Intech, the integrated information technology conference to be held Aug. 26-29 in San Francisco. Rappaport, Krichbaum and Weber will be speaking on voice/data integration, one of five subject areas at this conference, sponsored by National Trade Productions, Inc., Suite 400, 2111 Eisenhower Ave., Alexandria, Va. 22314.

ILLUSTRATIONS BY ALAN HOPKINS

Rappaport: Integrating voice and data consists of three almost independent submarkets. I'll call them the workstation market, the office equipment market and the network market. What mix of markets a corporation decides to use is really triggered by the impetus it has in integrating voice and data.

The network market is probably the one that receives the most attention because there are tremendous savings available by integrating voice and data, either by putting in tie lines, sharing Wats lines, going to full digital T1 or the like.

The Consultant
David Rappaport
Arthur Andersen & Co.

The office equipment market is the local-area network or private branch exchange. The impetus there is reduction in wiring costs and increased flexibility in the office.

Then, finally, there's the workstation market. Here the benefit is productivity improvements and not so much hard dollar savings. We have coming on the scene integrated voice/data workstations — personal computers with special boards in them.

The User
Ralph Krichbaum
Westinghouse

Krichbaum: I can tell you where Westinghouse has done things. In the network area, we have implemented digital facilities wherever possible. We use T1s, microwave and CATV for up to 15 miles or fiber optics where we can get it from the local telephone company.

We're also doing a lot of work in the local sites. For a number of years, we have advocated the installation of six pairs of wires from the wiring closet to each workstation when we install a new PBX. These terminate in two miniature six-pin telephone jacks, one for voice and one for data.

Rappaport: In installing your systems at Westinghouse, where were the big paybacks?

Krichbaum: The T1 between Orlando, Fla., and Pittsburgh is a case in point. It eliminated 38 analog voice circuits, each using 32K bit/sec., and five 56K bit/sec. [AT&T Dataphone Digital Service (DDS)] circuits. The data lines cost more than $6,000 each, and the voice circuits cost a little more than $1,000 each. The T1 cost $28,000 per month, and termination gear, amortized over four years, came to another $2,000 a month. We ended up cutting costs in half.

The big advantage of the T1s is that if you need an additional 56K bits — in our case we're using 32K bits for voice — you get two analog private lines from the telephone company, and that's essentially your cost for 56K bits.

The Vendor
Roy Weber
AT&T Bell Labs

Rappaport: So you not only save money, but you increase your long-term flexibility?

Krichbaum: Absolutely; flexibility is key. This business is so volatile that we try to maintain as much flexibility as we can.

Rappaport: Roy, from the AT&T/Bell Laboratories perspective, where is integrated voice/data going?

Weber: I come at it from the networking perspective. Integration of voice and data can vary all over the place. The simplest form is a point-to-point, 1.5M-bit facility with a fixed-channel assignment of circuits. Currently, 32K-bit coding of voice is an important option. Such configurations are economically attractive when you have some data circuits to go along with the voice circuits. The concept of inventorying bandwidth for flexibility and disaster recovery is also important.

One can be a lot bolder. You can certainly integrate access to a long-haul carrier service node and fan out that access to various services in a static way, a reconfigurable way and ultimately, with ISDN [Integrated Services Digital Network], in a call-by-call way. Certainly, integration goes to the terminal level as well. It exists in pre-ISDN terminals and now with some advanced personal computer packages.

The key that everyone is searching for is the application-level integration of voice and data. Corporations shouldn't be concerned only with an individual facility or a single application. Many companies are doing the wrong thing when they build application-specific networks that turn out to be inflexible. These networks can't grow, and hence, the companies get themselves into trouble.

Integration networking is critical. The use of a 1.5M-bit backbone network with overflow to public networks, integrated operationally, makes a lot of sense.

Rappaport: Where are we in implementing that spectrum from T1s to full ISDN? What is the time frame? And where does the small user fit in? Doesn't the small user get integrated voice/data just by sharing his Wats line in a pure dial mode?

Weber: Absolutely. Wats and 800 service are used for data as well as voice. That's integration almost at a trivial level, but it's certainly important. T1 facilities are used extensively by major customers for integrating voice and data, certainly on a fixed, point-to-point basis. One can get a 1.5M-bit access facility and then fan out the access channels to a set of special services.

In addition, with customer control and reconfiguration capabilities, one can reconfigure the resulting networks. That's being planned by people who are very interested in things like disaster recovery, where you have a backup host computer to which you want to redirect your entire network in minutes.

This all exists today. What we're going to see is that kind of access technology being applied to the public switched services as well. In fact, it has all been developed and is in the tariff process right now. Within the next year or two, we're going to see the introduction of ISDN capabilities where you can do call-by-call assignment of channels. It's going to take awhile for that to penetrate and for people to start using ISDN protocols and the like. I think we'll see the introduction of ISDN within the next year or two, both in network and terminal-type products.

Rappaport: When we're talking about integrating voice and data, planning becomes critical. One has to take the broad view of the communications needs of the business, how we can fill those needs cost-effectively and even, to some extent, how we can use communications to give us a competitive advantage over others in our industry.

Most companies are just starting to become aware of this need for long-range planning and find they are suffering from the stumbling block of decentralized communications management, where data communications is managed in one group, voice communications is managed somewhere else and text somewhere else.

What do you see as the direction corporations should move in when they find this problem? How do we get around the organizational or political hurdle to use technology effectively?

Krichbaum: About five years ago, data communications was rolled in under corporate communications. When the Westinghouse Productivity and Quality Center was formed, the corporate telecommunications department became a part of the Corporate Systems Integration (CSI) department. As the name implies, CSI is responsible for promoting the integration of all technologies, especially electronic, as they are used in the factory and the office.

The plan that we are currently implementing — the installation of communications hubs at Westinghouse sites around the country, connected by T1 facilities to the Communications Service Center in Pittsburgh — was justified by the combined requirements of voice and data. Most of these hubs house a voice tandem switch, a corporate packet switch and data multiplexing equipment. Shared use of power transmission facilities, equipment rooms, backup power and support personnel permitted the required cost justification.

The corporate packet network permits us to combine the separate transaction networks that connect users to the computer centers supporting the many Westinghouse businesses. With small packet switches overseas and connections with the public networks, we are able to support our international users as well.

What we would like to see for local-area networking is every terminal tied into a packet assembler/disassembler (PAD). We would like to see that at 64K bits, but today those PADs aren't available. We really believe that would be an optimum network because addressing is a big

REST ASSURED
THE CERMETEK SECURITY MODEM
IS ON THE JOB!

Don't lose sleep worrying about an unattended computer. The CERMETEK SECURITY MODEM is the best guard for the job.

Communication and Security for only $695 is an unbeatable buy! The Security Modem offers a variety of security options to fit your specific needs. In addition to 4 levels of access security, the modem has originate (dial-out) security and will maintain an audit trail of all access attempts. Changing security options or codes requires a key.

Four Levels of Access Security
- No Security — an intelligent 1200/300/110 bps modem, fully compatible with the Hayes SMARTMODEM 1200™
- Password Only — requires a valid 8 digit password to access the computer
- Password and Call-Back — After receiving a valid password, the modem calls back to the phone number linked to that password in its memory.
- Password and Call-Back on Second Security Line — The modem can make the call-back call on a second secret phone line, preventing the interception of the call-back by a sophisticated security breaker.

Additional Modem Features
- 2 year limited warranty
- Auto-dial, auto-answer
- synchronous as well as asynchronous
- call progress monitoring
- 41 auto-dial numbers stored, 25 for call-back numbers in security mode

"Communication for your computer, Security for your peace of mind."

problem, in this corporation at least, and with a packet network, you have a built-in addressing scheme.

Weber: Packet switching is a very important technology to solve the application-specific network problem. Such networks usually consist of many multipoint private lines scattered all over the country. When the corporation tries to grow new applications, they find these networks are inflexible. Frequently we recommend packet-type technology. For intercorporate communications, packet is ideal.

Krichbaum: Another big advantage is that when you start an application, you don't have to connect it directly to a private packet network. You can use a public packet network to get to a private network.

Rappaport: Roy, what do you see the companies you deal with in the industry doing to get around the political barriers for planning and integrating voice and data?

Weber: Some are doing it effectively, and some are not. Some still play the territorial game of one person managing the computer center and another managing voice communications. They're losing out to their competitors, who have effectively gotten over that. People who have put telecommunications into the core of the company's business, as opposed to just using it as an auxiliary function, seem to do the best.

Rappaport: The ones who are successful today have attacked a business problem rather than using technology just to clean up here and there. What is the situation at Westinghouse in terms of getting over territorial problems? What plan do you have?

Krichbaum: We have the five-year strategic plan, which is to go as much as possible to digital. Early next year it's our plan to implement an essentially Class 4 office that will be ISDN-compatible. So we're looking at a central-office-type switch that will handle digital facilities in multiples of 56K or 64K bits under ISDN.

The plan is to provide dedicated circuits where we have some very high bandwidth requirements. In CAD/CAM, for example, the voluminous data that goes to the high-resolution screen doesn't lend itself too well to the packet, so we tend to do that by multiplexing.

Rappaport: What is driving this five-year communications plan at Westinghouse? Are there strategic business advantages that you see?

Krichbaum: We have a corporate electronic mail system, a voice mail system, and quite a few vendors and suppliers on that system. It really enhances our ability to communicate with our suppliers and customers. We are providing customers with a way to look at our inventories in our warehouses. We have customers that submit their orders to us by terminal. Good customers can find out for themselves when delivery could be.

Weber: That's exactly what I was talking about. That gives you an advantage over a competitor who is just trying to save costs and is not looking at those opportunities.

> ***Corporations shouldn't be concerned only with a single facility or application. Many companies are doing the wrong thing when they build application-specific networks that turn out to be inflexible. These networks can't grow, and the companies get into trouble.***

I have an example that might shed light on some of the opportunities strategically and technically. A large customer with many locations scattered through the country had a data network that was the essential to the running of its business. If there were any failures in the data network, the customer was out of business. The customer also had a significant need to manage incoming calls.

We designed for them a backbone Electronic Tandem Network (ETN) built out of 1.5M-bit transmission facilities. The voice load allowed a triangular configuration and left room for data to ride free.

The triangular design meant that every one of the hub locations had two ways to get to every other location. We therefore had a very reliable data network because of the integration with voice. Traffic from smaller locations and overflow from the large locations were served by a software defined network. We then integrated that network and the ETN operationally together.

Rappaport: As I understand it, in putting that network together, you created a PBX-based ETN with backbones using T1s. Do both voice and data flow through the PBX?

Weber: Data doesn't necessarily have to flow through the PBX. You can have a front-end system that separates the voice and data. Facility switching within the network provides an additional opportunity. We use a device called a Digital Access and Cross-Connect System to allow the customer to reconfigure its backbone network.

Rappaport: In this example, you integrate voice and data in a circuit-switched or circuit allocation style. Before, we were talking about packet switching as the optimum. How does one choose which to use?

Weber: It depends on the application. Packet switching is good for certain things, but this particular customer had a very big data need focused on a single host computer. For this customer, there were some auxiliary functions where packet switching made sense, but for the bulk of its needs, statistical multiplexing onto a reconfigurable channel network was ideal.

Rappaport: In looking at circuit switching vs. packet switching, voice drives us to channel allocation or circuit switching because we don't have packet-switched voice. Do you see a packet-switching environment whereby we would truly integrate voice and data in that type of environment?

Weber: Absolutely. We have some very aggressive exploratory work under way at Bell Labs to understand how we can become more flexible in the management of bandwidth. That implies you have to deal with voice, because voice uses a lot of bits.

We have prototypes of packetized voice equipment; we are certainly not using traditional packet switches and X.25 protocols. We integrate data and image with the voice. That kind of thing is working in the laboratories today — in fact, there is a field trial under way where we're tying several AT&T sites together.

We're taking a careful look at how we grow the ISDN capabilities and take advantage of this technology when it's ready. While I'm not promising that the service will be introduced within the next few years, we are looking aggressively at the technology.

Krichbaum: I think you can see the pieces of that in many places. First of all, we're using four times as many bits for voice as we need because we want to handle dial-up data on the voice network. If all you're talking about is faithful reproduction of voice, 16K bits is easily attainable, and Bell Labs has had that capability for a number of years.

You mentioned before having triangular circuits so that you always have redundancy. We do that in our packet network and, to a lesser extent, in our voice network. One of the advantages of packet is that the switches and the design of the system will automatically switch if you lose a circuit. In the voice and more conventional multiplexing world, you have to do that manually. You're talking about minutes to make the backup.

Rappaport: Until now, Ralph — with your example at Westinghouse — and Roy — with the example of your client — we've been talking about the big user. How does the smaller user get started?

Weber: Smaller users who don't need or want a big backbone network still have voice and data coming out of their particular buildings. The ability to integrate access to a long-haul carrier or to a local operating company using a 1.5M-bit facility will be important to them. You can break up the access and have one of those channels access a packet service, another channel be part of the private line, another be a Wats line and another an 800 line.

If you're much smaller, then we're talking about the basic-rate ISDN rather than the primary-rate ISDN. Centrex and key system-like services, with an ISDN interface, will also be an option. There are certainly some pre-ISDN capabilities now in things like local-area data transport that the divested Bell operating companies are deploying.

Rappaport: As a prerequisite for them to take advantage of this environment, are we saying then that they need to position themselves by selecting a voice/data PBX, one of the third- or fourth-generation PBX, as a basis to get started?

Weber: That's desirable. It depends on the size of the customer.

Krichbaum: My feeling is that ISDN is going to be very viable around 1990. We're going to have a corporate ISDN before that. Today you can buy a PBX, and while it might last more than five years, you certainly shouldn't plan for a life of more than five years. Within the next couple of years, anyone who buys a PBX without vendor commitment to support the ISDN capability is backing himself into a corner.

Rappaport: Are you talking about the commitment to support the I-series international standard? Are we going to see those standards implemented in the U.S.?

Krichbaum: We're seeing the international and North American standards coming together. We still have a difference in the standards on the size of the T1. The international uses 32 channels, 30 of which are usable. In North America, you use 24 channels, 23 of which are usable. It's a world market. The need is to communicate worldwide.

AT&T wants to sell internationally, and the Japanese, as well as Europeans and some others, want to sell here. As a matter of fact, I think it's part of the European plan to try to implement ISDN as quickly as possible so that their local supplier can perhaps get a step up on the North American suppliers. We may see an attempt in some foreign countries to get to all-digital ISDN service as quickly as possible.

It's my opinion that we're going to see a world of communications-rich areas and communications-poor areas. I don't think we can export digital technology to those places where we can't get DDS today.

Weber: You're going to see AT&T supporting those standards both from the customer premises equipment and the network sides and in the product side that we sell to other communications companies. That's a corporate commitment. We're very active in the international bodies that are shaping those standards. We're designing, building and defining services that make use of the ISDN standards.

Rappaport: We've talked about a lot of things in the late '80s or 1990s time frame.

Weber: I disagree. We've also talked about some here-and-now products and services.

Rappaport: Certainly the pace is picking up speed in this area. It's volatile, both from a technology and a regulatory perspective. The things people are doing today are cost driven and are therefore susceptible to the vagaries of the tariff structure. Could we be putting in things now that we're going to be stuck with in two years and that are no longer economical?

Krichbaum: One of our axioms is that we maintain a flexible position. There are alternatives. AT&T provided T1. MCI now provides it. There's a lot of fiber optics being designed to go into the ground. It's like satellites — I don't believe it all will be put in, because there's a lot of redundancy. Satellites are a viable alternative. We would prefer to stay terrestrial because satellites have delay problems that in voice you cannot get around and in data that you can get around only with extra effort.

The digital direction is driven by the fact that the price of memory comes down 30% a year and the price of logic comes down 25% a year. It's so inexpensive to make digital devices. The direct product cost is less than the design cost for some of the smaller vendors. We feel that the digital direction is going to take over. We believe that, standards aside, the basic environment is going to force it.

Rappaport: Are you saying you can move with changes in tariff structures and in the technology?

Krichbaum: Yes. Our basic objective is to maintain flexibility. Our long-range objective is to take advantage of the cost savings and capability offered by the new technology, and our short-range objective is to provide for the corporation's communications needs in a cost-effective manner.

Historically, we have invested in the people and tools needed to manage our networks. We have lived in a mixed-vendor environment for more than a decade.

We believe ISDN will be a fact. The desire of the communications vendors to get their users to spend more money is there. There's also the desire of the users to do things such as full-motion videoconferencing. It's a question of when, not whether.

Rappaport: So the needs are there, but we just haven't made it economical to implement?

Krichbaum: It's a chicken-and-egg situation. Packet-network PADs don't have 56K- or 64K-bit ports today. Most terminals won't communicate at 56K bits because those facilities haven't been available. But now there are PBXs at a site to permit you to communicate at that speed. It won't be too long until we'll see those speeds for IBM Personal Computers and many other devices. Transmitting at 56K bits doesn't take much more capacity than transmitting at 300 bits.

Rappaport: What about the workstation? Today we see terminals with certain telephone facilities or personal computers with telephones attached. These are made either by adding a board to a standard personal computer or by producing a new stand-alone unit. However, few applications exist to take advantage of that integration.

Krichbaum: While we plan rather far ahead, we're up to our ears trying to implement what people want today. We don't get a lot of requests for that. I'm on a number of committees where we look at those areas, but we don't see the payback; we don't see users even thinking in that direction.

Weber: There are some early forms of integrated voice/data applications, but certainly a lot more maturing is needed. Already in existence are applications such as unified messaging, where voice mail, electronic mail, station callback and message center services have integrated alerting and retrieval functions.

I see these things beginning, but clearly we have a long way to go. I believe there will be lots of integrated voice/data applications coming out of the woodwork once we have the technological foundation.

Why the time has never been better to get your own subscription to Computerworld:

FREE CLOCK WITH YOUR SUBSCRIPTION

Subscribe to *Computerworld* now, and we'll send you this miniature, personal computer clock. Free. The clock displays the date, the hour, minute and second, and makes a handsome desk-top piece for your office. And as we said, it's a gift from us to thank you for becoming a new subscriber to *Computerworld*.

51 ISSUES OF *COMPUTERWORLD*

In addition to the free clock, of course, you'll receive 51 issues of *Computerworld*. So you won't have to wait for a co-worker's copy to keep up-to-date on what's taking place in the computer field.

YOU'LL ALSO RECEIVE SPECIAL FOCUS ISSUES

As a *Computerworld* subscriber, you'll also receive our highly-acclaimed COMPUTERWORLD FOCUS Issues — at no extra charge. Published once a month (except July and December), these bonus issues focus on a single topic. Here is a sampling: UNIX™, Office Automation, Microcomputer Software, Business Graphics, Applications Software, Manufacturing, Networks, Systems Software, Microcomputer Hardware. COMPUTERWORLD FOCUS helps you plan, purchase, and save money. And these bonus issues are sent only to *Computerworld* subscribers — it's like getting a subscription to a second magazine FREE!

As you can see, there are plenty of reasons to subscribe to *Computerworld*. So don't rely on someone else to lend you theirs. Be well-informed — with 51 issues of *Computerworld* plus the COMPUTERWORLD FOCUS Issues — without having to wait.

Now you know why the time has never been better to subscribe to *Computerworld*.

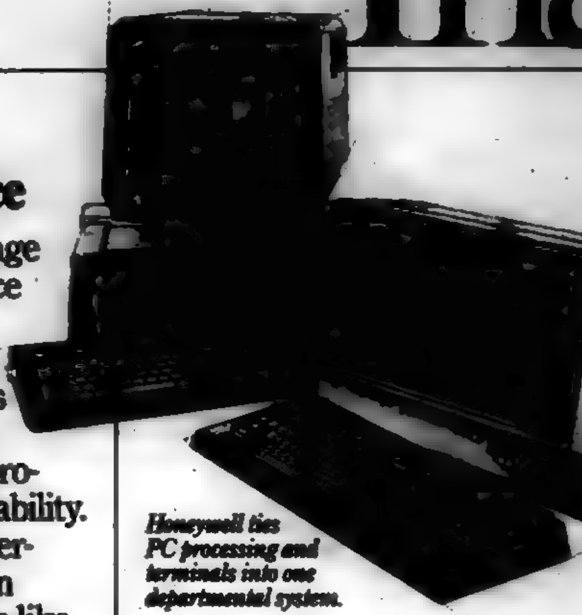
COMPUTERWORLD
THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

[illegible]

Honeywell has better office integration than Wang or IBM.

That's right.



Honeywell ties PC processing and terminals into one departmental system.

Introducing The Honeywell Office

Honeywell is about to change the way you think about office automation.

Because standalone and non-compatible product lines aren't enough to provide the most dramatic increases in productivity and corporate profitability.

The biggest increases in performance can only come from office automation capabilities like integration and networking that allow all systems to "talk" to each other—which is why we designed The Honeywell Office.

The Honeywell Office integrates office processing, data processing, networking and communications, and distributes these resources across a single, compatible product line of micros, minis, and superminis.

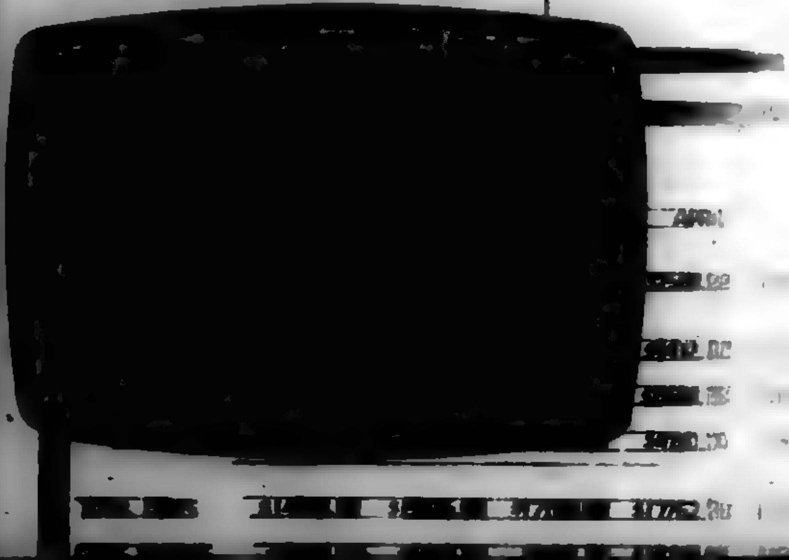
It's the reason why one customer credited our approach to office integration with helping to increase sales by 50%.

Here's how The Honeywell Office can help you manage and direct your information resources more efficiently.

Unsurpassed Office Processing

We started with competitive word processing in virtually every area and developed superiority in the crucial area of file management.

INFOCALC, our three dimensional spreadsheet, lets you merge financial data and text.



But we didn't stop there.

We integrated decision support tools and distributed networking capabilities so that your departments can transfer, share, and combine office and data processing information with simple commands. Without unnecessary steps. Without costly duplication of efforts.

InfoCalc, our integrated spreadsheet, lets managers access information from the department across the country as easily as the sales office from across the corridor.

There is also a database management capability that allows professionals to set up their own departmental databases.

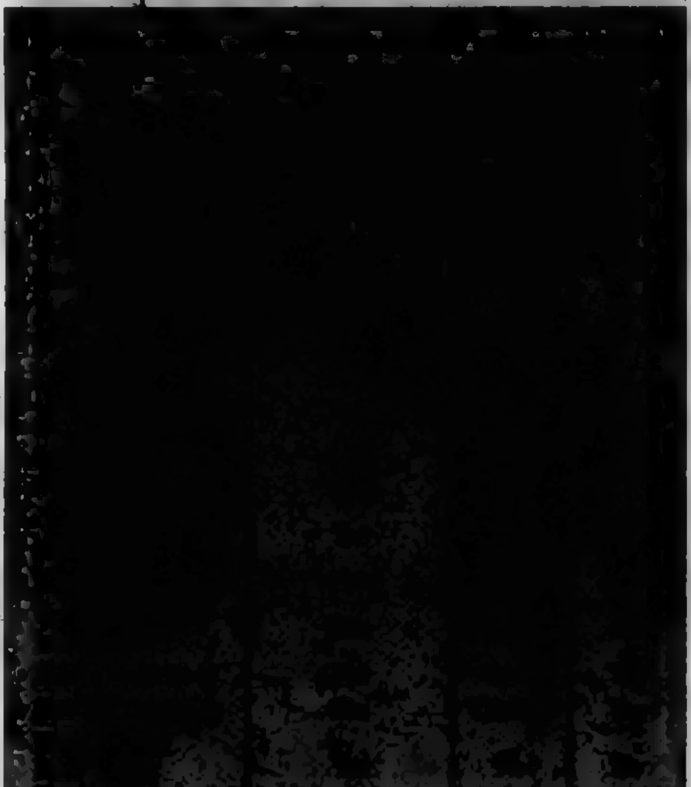
And that's only half of it. The other half is how *well* it integrates the office side of your business with the data processing side.

Flexible Data Processing

No word processing vendor can integrate the extensive array of data processing products you'll find with The Honeywell Office.

The Honeywell Office provides unrivaled flexibility by combining office and data processing into one distributed, departmental system. It supplies integrated transaction processing, database management, program development tools, query and report, data entry and specialized industry applications.

So now your accounting, marketing, and other departments can access and control their information.



*Over 2000 installations.

And when it comes to writing new applications, we offer a full complement of programming languages that include BASIC, COBOL, FORTRAN, ASSEMBLY, ADA, C, RPG, and PASCAL.

Quite simply, The Honeywell Office gives you a better growth path, stronger database management, and greater systems flexibility than our competitors.

Honeywell.

Advanced networking lets you connect all your departments.

Integrated Networking and Communications

Honeywell expertise in networking and communications helped the Metropolitan Life Insurance Company create one of the largest distributed branch office networks of its kind.

Over 1300 Met Life district sales offices in North America are automated using our DPS 6 minicomputers, linked through an SNA network that supplies reliable branch office-to-IBM host communications.

Unlike competitors who require mainframes for network control, we aren't limited to creating star networks. Our ISO based Distributed Systems Architecture (DSA), gives you the flexibility to configure ring, mesh, peer-to-peer, and other styles of networks.

For local and remote user-to-user communications, our integrated electronic mail helps minimize network costs by letting you route your mail and documents in economical quantities, and prioritizes transmission by time of day.

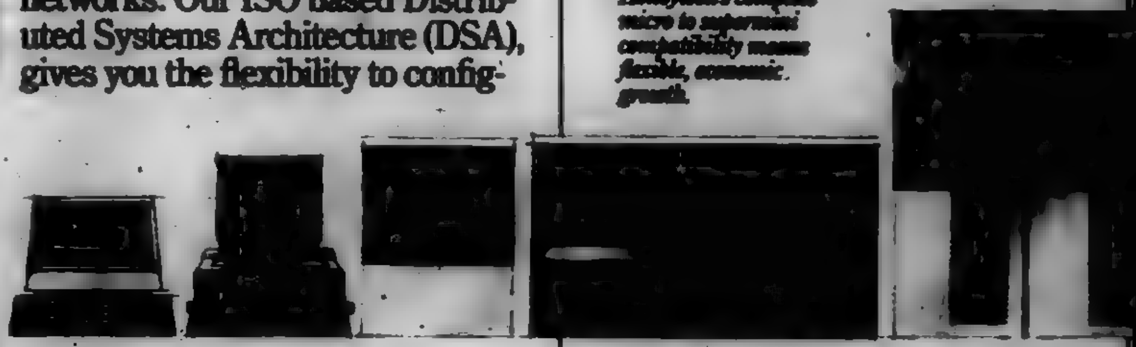
Finally, The Honeywell Office lets you access network services such as CompuServe, Dow Jones, The Source and Weslaw right from your desktop.

Complete Micro to Mini to Supermini Compatibility

From the very beginning, The Honeywell Office was designed for complete compatibility from top to bottom. Compatible hardware. Compatible software. And compatible communications facilities.

One consistent interface is presented to all systems, small and large, permitting the virtually limitless exchange of information. Standard menus and prompts provide major user training benefits. Upgrade options are more flexible and economical because all systems can be linked together.

Honeywell's complete micro to supermini compatibility means flexible, economic growth.



Service and Support that Make All Systems Go

The Honeywell Office is backed by TotalCare,™ our comprehensive nationwide support program.

Uptime, after all, is everything, and TotalCare™ provides everything you need in programs and services that can be tailored to help meet your requirements.

The Honeywell Office The Smarter Choice

The Honeywell Office reflects a strong commitment and adherence to a standard interface, state-of-the-art technology, and a modular, open ended design, so that your office can grow as your needs do.

For more information call 1-800-328-5111, Ext 2783. Or write:

Honeywell Information Systems,
300 Concord Rd., MS 810,
Billerica, MA 01821.

Together, we can find the answers.

Honeywell

TURBO

Why are SYBACK & SyncSort CMS the fastest things on no wheels?

(More technology in the tank!)

Call (201) 568-9700.

Arrange a test drive.

You say you've always had very simple tastes? All you ever wanted was the best?

Well, step into our showroom and kick a few tires! We'll show you two programs that are the Ferrari and Lamborghini of VM programs.

- **SYBACK — the world's fastest and most maneuverable backup, restore and copying program;**
- **Syncsort CMS — the world's fastest and most maneuverable VM/CMS sort program.**

What makes 'em so special? Well . . .

(1) TURBO PERFORMANCE: Have you ever stepped down on the gas in a dangerous driving situation and discovered . . . nothing? Well, that'll never happen to you with these two vehicles.

Both are equipped with our special brand of "software turbocharging." We call it FBT, which stands for Fluid Buffering Technique. Our competitors call it something else.

We discovered FBT one dark and rainy night when we were trying to find a way to speed up the movement of data in sort programs. After crying "Eureka," we applied it to our OS and DOS sort programs. The results were . . . wow!

Now we've carried that bright idea over into VM dump-restores and sort programs. And the results are still wow! Compared to any other backup or sort program clogging the nation's VM thruways today, SYBACK and SyncSort CMS will save you up to:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **55% in TTime;**
- **75% in SIOs.**

So who needs all that speed? You do. If you want to optimize your VM operations, stay out of needless DP traffic jams, and make the boss happy with your throughput.

Here's what happened to one large government agency: Their backup operations used to require a full 24 hours to complete. Then they installed SYBACK. Now their backup takes — are you ready? — one-half hour!

(2) EASY HANDLING: SYBACK and SyncSort CMS are among the most flexible, user-friendly programs ever produced by anybody anywhere. That's one reason programmers love 'em. And where does it say that backup and sort operations have to be hard to be good?

(3) "MISTER SOFTWRENCH" SERVICE: We've got the best pit crew in the business. More than 85% of all customer requests are resolved within 24 hours.

If you'd like to put a little high technology in your VM tank, give us a call. We might even take your used VM dump-restore or sort program as a trade-in!

syncsort INC.

Syncsort Incorporated 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

Mini software outlook mixed

Events in the microcomputer and mainframe software arenas tend to overshadow trends in minicomputer and supermini software. But, as two recent International Data Corp. (IDC) studies indicate, the minicomputer world is seeing plenty of software action. Even within IDC, however, there are contrasting viewpoints as to the future of mid-range processors — and the software that runs on them.

Recently, IDC's "Software Watch" newsletter pointed out that independent data base management system vendors are coming to see the minicomputer environment as a valuable source of revenue that has been left largely untapped. The IBM mainframe marketplace has been a hotly contested one for the DBMS makers, and observers are suggesting that, while the saturation point is still off in the distance, the IBM mainframe market has been deeply penetrated.

Thus, IDC said, some industry powerhouses have begun to port their DBMS products to the leading minis such as Digital Equipment Corp.'s VAX line or Data General Corp.'s MV 10000, both of which boast a large installed base. According to IDC, 35% of mini sites had installed a DBMS at year-end 1984. But, according to "Software Watch," that figure is deceptively high, because Hewlett-Packard Co. bundles its Image DBMS as part of its operating system. With Image sites filtered out of the sample, only 16% of mini sites had

Girish Parikh

Published to coincide with the opening of the recent 1985 National Computer Conference (NCC) in Chicago, Girish Parikh's study titled "There is a Fortune to be Made in Software Maintenance," (Shetal Enterprises, Chicago) sheds light on what its author calls the vast opportunities awaiting exploitation in the field of software maintenance.

Parikh, a Chicago-based independent consultant and president of the research and publishing firm of Shetal Enterprises, is an author on the subject of software maintenance. Parikh spent two years researching the study, subtitled "Opportunities in the $30 Billion Software Aftermarket," which he hopes will draw attention to the growing — and increasingly costly — problem of maintenance and the potential career and product openings that exist today.

Parikh discussed the study and maintenance issues in general with Computerworld *Software and Services Editor John Gallant during NCC.*

Do you think conferences like NCC devote enough attention to the subject of software maintenance?
I am disappointed that there were very few sessions at NCC devoted to maintenance. That reflects that the industry is more concerned with front-end, or new development, projects than it is with maintenance. Maintenance is a big subject, but it is not as glamorous as development and advances in areas like artificial intelligence and microcomputers.

It is important for that perception to change. Maintenance should be seen as continuous development. There is no analogy between appliances and software. Software is an intellectual work that should grow and evolve. We need methods and standards for maintenance and a way to transfer maintenance expertise from one professional to others. Maintenance costs industry so much — billions of dollars every year — that we have to come up with these things.

What is the major finding of your study?
I found that maintenance is a wide-open area in terms of research to be undertak-

SOFTLINE/FRANK SWEET

Understanding flow of records key to DBMS design

Data flows through files like water through an irrigation system. In parts of a data base, records race along in a rush, while in other places they pool into reservoirs with little perceptible movement. Yet everywhere they follow a set rule: Pool time times flow rate equals population.

Records follow a steady-state law. The length of time that records spend in any section times the rate at which records flow into the section is numerically equal to the number of records currently in the section. Data base designers apply this law in all steps of their work, from initial user interviews to physical file design.

Steady-state means that the flow rate of records entering a section eventually equals the rate at which records leave. Say that 1,000 new records are added to a file each month. The file would be in a steady state if, over a year, an average of 1,000 records were removed from the file each month. Some records might be removed soon after being added while others could stay on file forever. If more records were removed each month than were added, the file would soon disappear entirely, thus reaching a steady state with a population of zero. If the reverse were true, the file would quickly reach the capacity limit of the storage medium.

The data base should contain no unidentified data sinks or data sources. Consider a credit-checking procedure where credit applications are funneled into a department for review. If we know that their total backlog is more or less constant from year to year, we infer that just as many emerge each month as are sent in. The only way it could be otherwise would be if somewhere in the department applications were being entered into a data sink, never to be seen again, or if someone were producing new applications internally, which would constitute a data source. Both are unlikely.

Since records out will eventually equal records in, we can use either in computing the formula — whichever is easiest to measure. A typical vendor file may receive new records whenever the firm does business with a new supplier. Inactive vendors are purged once each year. In researching the system, it may be easier to estimate the purge rate than to estimate the number of vendors added each month. And unless the firm is withering away or is in a state of uncontrolled growth, the number of inactive records purged each year will be close to the number of new records added.

The importance of the formula is that given any two of the terms, we can easily compute the third. Given all three, we can cross-check them against each other. The following problem, the case of the pending work orders, illustrates how the formula works.

As part of a materials management project, we were designing a work order reservation system. New manufacturing jobs, represented by work

See SWEET page 40

Sweet is corporate manager of data administration for the Charter Co., a Fortune 100 firm in Jacksonville, Fla. He has worked with major data base management systems since 1970 and is a former president of the national (Cullinet Software, Inc.'s) IDMS User Association.

AVOID DOWNTIME, EQUIPMENT DAMAGE & LOSS!
WATER ALERT®
Surface Water Sensing Alarm Systems
• Produces a loud intermittent alarm when activated by water
• Early water detection (1/64" water film activates)
• provides maximum time for corrective action
• 9 Water Alert models, self-contained and remote powered
• 6 & 12 channel Remote Annunciators
RTS-400 Six Point Remote Temperature Scanner
• Display and trip preset to °F (0-199) or °C (0-100)
• AC line operated, rechargeable battery back-up
• Over or under temperature trip - relay and logic output
• Ambient or surface mount sensor - standard wiring to sensors

PARIKH

from page 33

on and careers to be pursued. No one has really given any attention to the problems involved or to the training that needs to be done.

As a result, we face all kinds of difficulties today. We spend at least 50% of our time on maintenance. Most programmers are not formally trained in maintenance, and our software documentation is poor.

IBM has estimated that maintenance personnel have to spend at least half of their time just trying to understand the programs before working on them.

All of that maintenance effort could be better spent on new development or other, more productive work. By training, providing better tools and streamlining the maintenance effort, we could pursue all kinds of interesting projects.

But we are trying to make advances in so many fields at once that we tend to overlook maintenance. We tend to think that new technology will solve the problem, but each generation of software has its own maintenance problems.

What do you mean by the term "software aftermarket?"
That is a term I have coined to describe any work done on software, whether it is modification, correction or enhancement, after the system has gone into use. By the $30 billion aftermarket, I am referring to James Martin's estimate of its size. I found that figure could be higher, but I went with the conservative estimate.

Are most companies sufficiently aware of the importance of maintenance?
Most managers are aware. But they don't know how to solve their problems. They don't express that because they think it will make them look bad. Thus, maintenance is often given only surface effort. But the problem won't go away until we address it and get to work on it.

Is awareness of the maintenance problem growing?
Yes. There are a lot of references to the problems in the press, and managers are increasingly aware of what needs to be done. But, as I said, the managers often don't know what to do or they don't have the resources to attack the problems.

What are the ramifications of fourth-generation languages on maintenance?
Fourth-generation languages spawn their own maintenance problems, especially if they are used to develop large programs. Even with a fourth-generation language, the programmer needs to think a system through carefully and design and document systematically. Many small programs or prototypes developed with a fourth-generation language grow into big systems. They start out small but become large applications without good design or documentation.

Is Cobol dying? What do the new Cobol 8X standards mean for maintenance?
Cobol is certainly not dying. We have billions of lines of Cobol code, and they won't soon go away. The Cobol 8X standards, because they embody modern programming techniques, will ease some of the maintenance problem . . . Languages are important, but good design and documentation are much more important in easing maintenance.

Are companies turning to modern programming techniques to ease maintenance work loads?
Very slowly. New ideas are not accepted quickly. If you check the personnel ads, you will see that very few companies are looking for people with structured design or modern programming skills. People are talking about the new techniques, but there aren't very many people using them or using them well.

Do you see a class of professional software maintainers arising?
Yes. Maintainers need different skills than developers, so you will see growing specialization in the future.

See PARIKH page 40

Selling systems software? In September Computerworld Focus targets your market.

When it comes to systems software, there are no easy choices. So in the September 18th issue of *Computerworld Focus* on Software: Systems, we take a good hard look at what's available now. And what's coming down the road in the near future.

Topics will include all the building blocks available for a fully integrated system. Like information center packages. Operating systems. Data base management systems. Productivity tools. Data dictionaries. Decision support systems. Even things like artificial intelligence and fourth generation languages.

We won't just look at the pieces. We'll also discuss how they work together to provide a completely integrated system for companies of nearly every size.

And we'll target right in on your market. 128,000 paid *Computerworld* subscribers. Plus thousands of attendees at the Software Expo in Dallas in September.

So if you've got systems software to sell, we've got the perfect place to do it. The September 18th issue of *Computerworld Focus* on Software: Systems. But hurry, closing is August 9th.

For more information, contact Ed Marecki, Vice-President/Sales, *Computerworld Focus*,
375 Cochituate Rd., Framingham, MA 01701.
Or call (617) 879-0700.

Accept the VMSORT challenge. Run the VMSORT race in your VM data center.

VM Software is now offering a special 30-day introductory free trial so you can benchmark VMSORT in your own environment.

And if VMSORT performs the way we bet it will, you'll have the optimum solution to your sort/merge needs.

REXX Appeal

In addition to being fast on your CPU, VMSORT is also fast and easy for your end users...with the ability to be called interactively from a terminal as well as user exits that can be easily coded in REXX!

With more user exits (and no exit required for data introduction) VMSORT is more flexible and powerful for your end users. VMSORT can be invoked from most program languages including PL/1, Cobol, and Assembler! It will even accept your existing OS and DOS sort statements without modification.

Fast in VM . . . Because It's The Only Race We Enter.

VMSORT is developed solely for the VM environment by VM Software, Inc.,...a recognized leader in software for the VM operating system. Because we concentrate 100% of our efforts in the VM environment (and not in OS or DOS)...all our software performs efficiently and dependably on your VM System...without modification.

Internal Documentation, Too!

VMSORT also takes the headaches out of reviewing and modifying sort statements with full control statement documentation ability...and statements can be kept in a file for easy retrieval.

Take Control of Your Data Center

VMSORT is available individually or as a component of VMCENTER, the most comprehensive data center management system for the VM environment.

Free 30 Day VMSORT Trial Run

Don't miss out on this exciting race. In fact, run it on your own course...and see for yourself how the new VMSORT is the ultimate sort utility...fast for you, and fast for the end user.

TELECOMMUNICATIONS AND

ONCE UPON A TIME THERE WAS A BABY WITH TWO MOTHERS.

It's a classic tale of trickery and deceit, of justice and love, of wisdom and as fine a piece of innovative thinking as you're apt to find anywhere.

Two women, as the legend goes, went to a washing place in the great desert west of the Jordan River. Neglecting their children, they began to wash their clothes—when tragedy struck with sharpened teeth. A wolf, seeing the two unattended infants, devoured one with awesome swiftness.

The women immediately fell into a violent quarrel, each claiming the surviving child as her own. After weeks of heated debate, the case was finally brought before King David.

"The baby is mine," wailed the first mother. "She lies," cried the second. Throwing his hands up in dismay, David dismissed the case for lack of evidence.

Enter Solomon, the King's teenage son, who had been listening from the next chamber. "Dear father," said Solomon, "give me leave to pronounce judgment between these two." Now it was known that Solomon, while young in years, was wise in the ways of people. So David consented.

"Let's chop the infant in two," said Solomon, "and give each woman a half." The first woman agreed to the division. The second, lamented. "Give her the child," she moaned, pointing to the other woman.

Solomon continued: "The child belongs to the one who weeps. She who would not see it harmed is the true mother."

Afterwards, it was said that King David, sitting on his golden throne, was so astonished by the originality and freshness of his son's decision that he wore a smile for days on end.

At BNR (Bell-Northern Research), we also appreciate innovative brilliance—whether it comes from our children or from our engineers and scientists.

Our R&D expertise has not only made us a world leader in the evolution of telecommunications, it has also enabled our parent company, Northern Telecom, to become the world's largest supplier of fully digital communications systems.

At BNR, we are committed to maintaining a two to three year lead over the competition. So come join the quest. Call our toll-free number 1-800-522-1500, ext. 145. And become part of a company where innovation is king and the quality is legendary.

BNR

WHERE FINE MINDS MANAGE INNOVATION.

An Equal Opportunity/Affirmative Action Employer

SAS Institute Inc. Announces

Lattice C Compilers for Your IBM Mainframe

Two years ago...

SAS Institute launched an effort to develop a subset of the SAS® Software System for the IBM Personal Computer. After careful study, we agreed that C was the programming language of choice. And that the Lattice® C compiler offered the quality, speed, and efficiency we needed.

One year ago...

Development had progressed so well that we expanded our efforts to include the entire SAS System on a PC, written in C. And to insure that the language, syntax, and commands would be identical across all operating systems, we decided that all future versions of the SAS System—regardless of hardware—would be derived from the same source code written in C. That meant that we needed a C compiler for IBM 370 mainframes. And it had to be good, since all our software products would depend on it.

So we approached Lattice, Inc. and asked if we could implement a version of the Lattice C compiler for IBM mainframes. With Lattice, Inc.'s agreement, development began and progressed rapidly.

Today...

Our efforts are complete—we have a first-rate IBM 370 C compiler. And we are pleased to offer this development tool to you. Now you can write in a single language that is source code compatible with your IBM mainframe and your IBM PC. We have faithfully implemented not only the language, but also the supporting library and environment.

Features of the Lattice C compiler for the 370 include:

- **Generation of reentrant object code.** Reentrancy allows many users to share the same code. Reentrancy is not an easy feature to achieve on the 370, especially if you use non-constant external variables, but we did it.
- **Optimization of the generated code.** We know the 370 instruction set and the various 370 operating environments. We have over 100 years of assembler language systems experience in our development staff.
- **Generated code executable in both 24-bit and 31-bit addressing modes.** You can run compiled programs above 16 megabytes in MVS/XA.
- **Generated code identical for OS and CMS operating systems.** You can move modules between MVS and CMS without even recompiling.
- **Complete libraries.** We have implemented all the library routines described by Kernighan and Ritchie (the informal C standard), and all the library routines supported by Lattice (except operating system dependent routines), plus extensions for dealing with 370 operating environments directly. Especially significant is our byte-addressable Unix®-style I/O access method.
- **Built-in functions.** Many of the traditional string handling functions are available as built-in functions, generating in-line machine code rather than function calls. Your call to move a string can result in just one MVC instruction rather than a function call and a loop.

In addition to mainframe software development, you can also use our new cross-compiler to develop PC software on your IBM mainframe. With our cross-compiler, you can compile Lattice C programs on your mainframe and generate object code ready to download to your PC.

With the cross-compiler, we also offer PLINK86™ and PLIB86™ by Phoenix Software Associates Ltd. The Phoenix link-editor and library management facility can bind several compiled programs on the mainframe and download immediately executable modules to your PC.

Tomorrow...

We believe that the C language offers the SAS System the path to true portability and maintainability. And we believe that other companies will make similar strategic decisions about C. Already, C is taught in most college computer science curriculums, and is replacing older languages in many. And almost every computer introduced to the market now has a C compiler.

C, the language of choice...

C supports structured programming with superior control features for conditionals, iteration, and case selection. C is good for data structures, with its elegant implementation of structures and pointers. C is conducive to portable coding. It is simple to adjust for the size differences of data elements on different machines.

Continuous support...

At SAS Institute, we support all our products. You license them annually; we support them continuously. You get updates at no additional charge. We have a continuing commitment to make our compiler better and better. We have the ultimate incentive—all our software products depend on it.

The competition...

If you would like to compare, the other vendors of 370 C compilers are: AT&T, Whitesmiths, Ltd., WATCOM Products Inc. (CMS only), Oracle Corp., Amdahl Corp. (UTS only), and IBM Corp. (VM/IX only). We think you will choose the Lattice C compiler from SAS Institute.

For more information...

Complete and mail the coupon today. Because we've got the development tool for your tomorrow.

SAS Institute Inc.
SAS Circle, Box 8000
Cary, NC 27511-8000
Telephone (919) 467-8000 x 280

I want to learn more about:

☐ the C compiler for MVS software developers
☐ the C compiler for CMS software developers
☐ the cross-compiler with PLINK86 and PLIB86

today...so I'll be ready for tomorrow.

Please complete or attach your business card.

MINIS

from page 33

installed a DBMS.

"Because it is a marketplace far from maturity, [we] expect the DBMS marketplace for minis to grow at much healthier rates than its mainframe counterpart. The business this year [1985] will grow some 40%," the newsletter predicted.

Another IDC study on AT&T Unix supermini implementations highlighted similar growth potential. In its report "Unix Migration Strategies of Supermini Users," IDC noted that roughly 10% of the sites surveyed are running Unix on at least one of their superminis. By the end of 1986, IDC estimated, that figure will grow to nearly 25%.

In addition, the study said that while only 25% of packaged software vendors currently offer programs running under Unix, nearly 50% of those vendors will offer Unix versions of their products by the end of this year. Not only will Unix be more widely installed in the mid-range world, IDC predicted, but a larger and more varied set of applications will be run under it.

Market heating up

It would appear from the IDC reports that the market for mini and supermini software is heating up. Vendors like DG, Wang Laboratories, Inc. and DEC are actively pursuing joint marketing and licensing deals with software vendors.

More important, it seems that software companies, many of whom have focused solely on the IBM world, are coming to recognize the extent — and potential value — of the installed base of minis.

But another messenger from IDC cast some gloom on the rosy predictions for the mini world. Commenting on the ongoing computer industry slump — which has been felt most keenly by the mini vendors — IDC Vice-President William Zachmann hypothesized that the "enormous expansion of the use of personal computers" has weakened overall demand for minis and superminis.

And, combined with micros, Zachmann said, multimicroprocessor systems will "ultimately pose a fundamental and eventually fatal challenge . . . to traditional small and mid-size systems."

Zachmann said the belief that microcomputer users' needs for access to corporate data bases or additional capacity would fuel demand for minis and larger systems is merely a myth. "The fact is that personal computers are perfectly capable of meeting many needs that would otherwise have required larger and more expensive systems," Zachmann said.

The incongruities among the IDC viewpoints seem to revolve around the fact that the Unix and DBMS studies investigated growth trends within the current installed base of minis and superminis. But Zachmann's paper pointed out what may be a longer term trend concerning the future growth of that installed base.

Zachmann's view is only one possible interpretation of the forces behind the slowdown stalling the growth of mini and supermini vendors. But, if he is correct and if growth continues to slow, software vendors are likely to look with a jaundiced eye on product development or migration projects aimed at mid-range machines.

And, without a rich and varied supply of software, prospective minicomputer users may turn to other hardware solutions, and current users could be left in the lurch.

ANYONE CAN TALK NETWORKING. BUT ONLY CODEX CAN PUT IT IN YOUR BUSINESS.

Many companies can offer a T1 multiplexer. But to fully benefit from T1 technology, you need a company that can offer a state-of-the-art mux along with advanced networking products for switching, concentration and routing.

Only Codex can do both.

First of all, we can provide you with a superior line of time division multiplexers for T1 applications: Our new Codex 6240 Series lets you merge simultaneous voice, data, and video transmission for significant savings in line costs.

The 6240 Series can combine 64 voice channels, or 64 synchronous data channels, or any mix of these, transmitting at speeds of 1.544 or 2.048 Mbps. And you can instantly reallocate channel bandwidth right from a central console to meet your changing needs. What's more, the Codex 6240 Series offers a range of advanced voice capabilities with 64, 32 and 16 Kbps digitization rates so you can pack even more channels over the same line.

Secondly, and most importantly, as you progress to more sophisticated configurations, we can provide everything needed to continue reducing line costs and improving network throughput.

You can select from a broad array of advanced networking products. And, as needed, rely on Codex Applications Engineers for design and technical support. It's all backed by one of the most comprehensive service programs in the industry.

T1 technology. To explore how much it can really do for your business both today and tomorrow, call us at 1-800-426-1212, ext. 243. Or write: Codex Corporation, Dept. 707-243, 20 Cabot Boulevard, Mansfield, MA 02048.

WESTWOOD COMPUTER CORPORATION

SOFTWARE & SERVICES

PARIKH from page 34

Some of the job titles I have pointed out in my study include software package maintenance specialist, maintenance tools expert and maintenance analyst.

The specialization is coming, but it is important that all software professionals have at least an overview knowledge of maintenance. There are specialists in the health field, for example, but they all have a general knowledge of medicine.

What are some common mistakes companies make regarding maintenance?

When developing systems, designers don't take the time to see potential maintenance problems. Very few managers can see two or three years down the road. Also, management usually emphasizes speed in development and maintenance. The emphasis should be equally on quality and clear documentation.

SWEET from page 33

orders, had their component requirements checked against available inventory before being issued to the shop. The idea was to avoid starting any job for which parts were missing. Instead, the job would be held while needed parts were expedited.

It was obvious that a file of pending work orders would be needed —those held awaiting parts — and that it would be necessary to know just how long to expect pending orders to stay on file. A study of the manual system found 200 work orders scattered around awaiting parts arrivals.

Although individual orders came and went, the total pending backlog had been constant at about 200 for as long as users could recall. Further, about 40 new work orders were issued to the floor each month and, on average, each waited for about 10 days for parts to arrive before being released.

Wait time?

How long will orders wait on file, on average, before the parts for each one are found?

The answer is five months, no less. Our challenge, to estimate the wait time, involved deciding whether to accept the numbers as given or to cross-check them with one another.

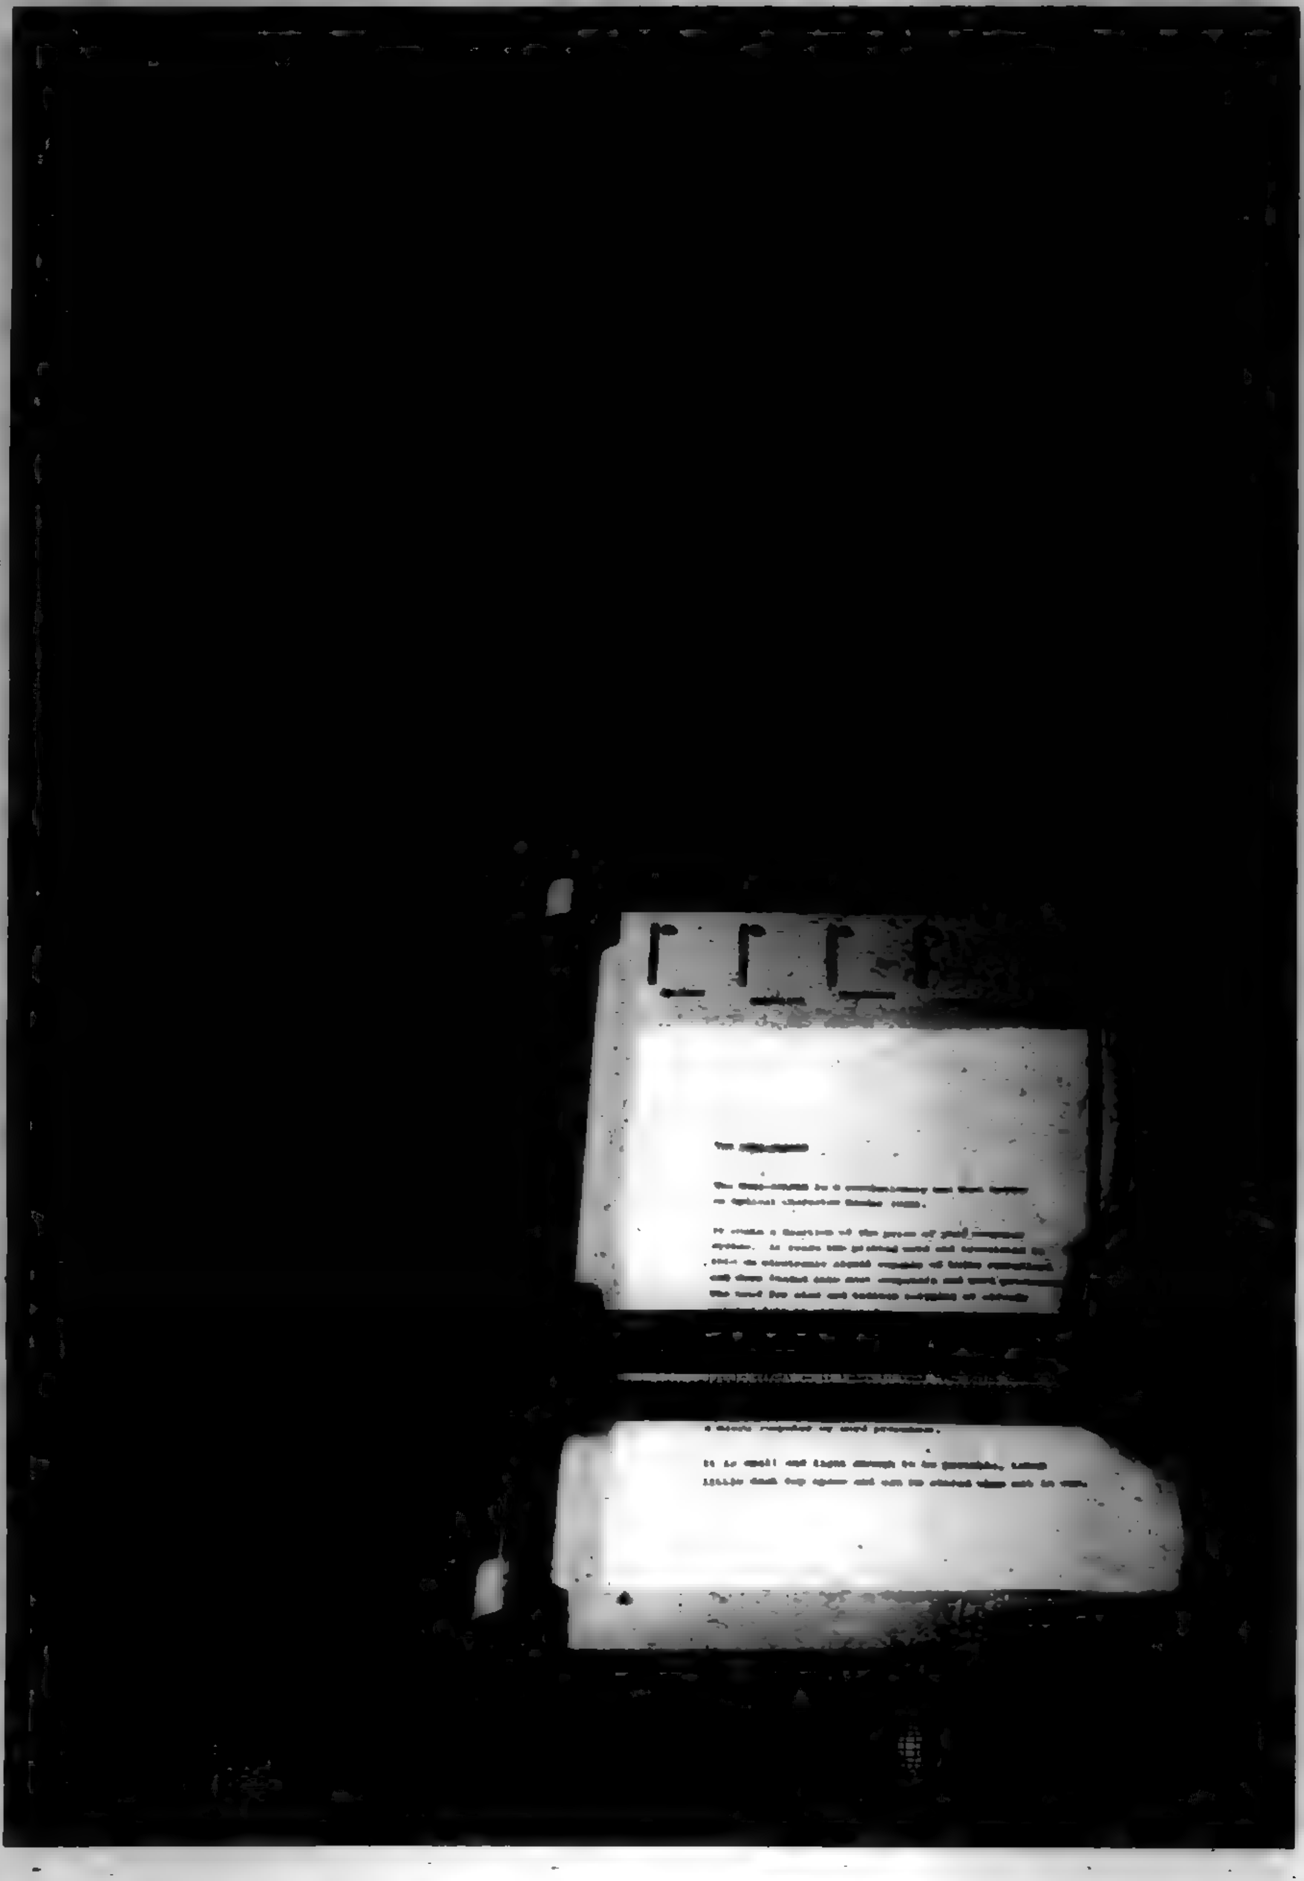
The interview-given pool time, in months (0.3), times the flow rate (40) is by no means equal to the observed population (200). The three figures we collected (flow rate, pool time, population) are contradictory. We must decide which one is wrong.

No challenge

The 200 orders sitting around were our observation, so that figure cannot be challenged. The 40 new orders per month would be easy to verify and thus were unlikely to be misstated. Besides, what motive would there be for understating the figure? It is more likely to be overstated ("See how hard we work?").

By elimination, this leaves the 10-day wait time. The number is suspect for two reasons: First, verifying it would seem impossible, so our informant could say anything at all with impunity. Second, it is the sort of thing higher management puts into goals or management objectives ("Orders must be processed within 10 days.").

When this happens, many will unconsciously adopt a convenient fiction rather than admit an unpleasant truth. Discarding the fishy 10-day figure, we compute average pool time to be population (200) divided by flow rate (40 per month), or 5 months.



Q. IF A MODEM IS A MODEM IS A MODEM, DOES IT REALLY MAKE A DIFFERENCE WHICH ONE I BUY?

A. The fact is, all modems are not created equal. For example, some modems are better signal processors than others. And these superior modems can make an important difference in your total network performance. A difference that can lead to important savings in telecommunications costs.

Q. How can a modem make a difference in my telecommunications costs?

A. The primary purpose of a network is to move information to and from end users and thereby improve their productivity. And a superior modem can improve the performance of your network in at least four areas: It can make your network more reliable. Give your end users faster response times. Minimize the time you and your people spend on network management. And a superior modem can also save you money in line charges.

Q. What makes a superior modem?

A. As you know, a modem converts a data stream into a signal that can be sent (usually over a phone line) from Point A to Point B.

Now that may sound simple enough, but there are a number of variables in that seemingly simple scenario. Such as, what's the distance between Points A and B? What's the line between the points? What's the condition and stability of the line? And many, many more. The point is, each variable carries technical implications that affect the design of the modem. And simply stated, a superior modem enjoys a superior design.

Q. Be specific. How can a superior modem save my company money?

A. Let's face it, modems are not the most expensive part of your telecommunications network. Chances are, line charges are. If you design a modem that can send data more reliably, then that modem can begin to affect your line charges. Every time a modem has a "hit," or an unsuccessful transmission of data, the data must be retransmitted, slowing down response time. The net effect is a reduction in the amount of information carried by the network.

If you use superior modems that give fewer hits, you'll have lower line costs per data unit transmitted and better throughput. Better throughput translates into time and cost savings.

Q. Can a superior modem correct the problem of faulty lines?

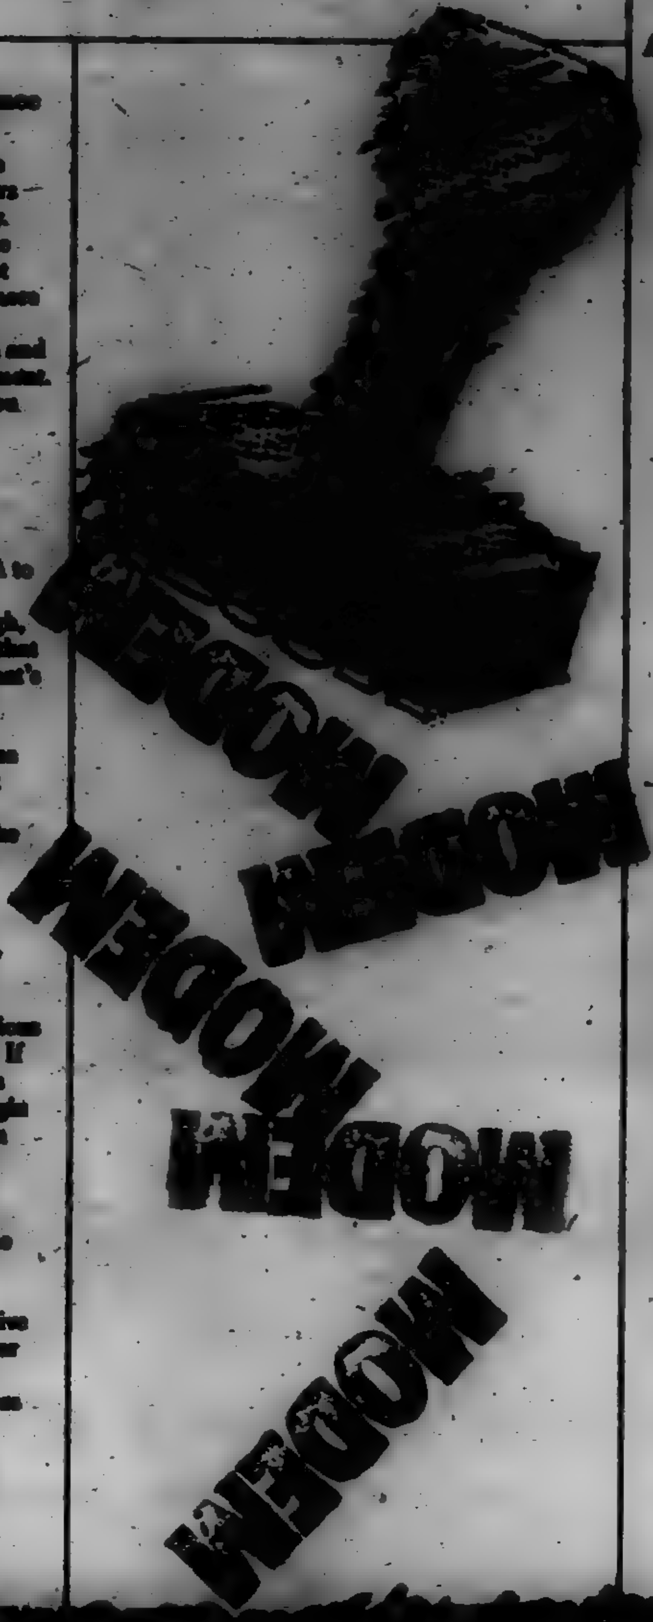
A. A superior modem can go a long way toward compensating for poor line conditions—and thus make marked improvements in the hit rate.

Take the IBM 3865 Modem, for example. It contains a custom microprocessor with an advanced algorithm that in effect enlarges the target area of acceptable transmissions. The result is that this reliable 9,600 bps modem can operate very effectively over unconditioned lines. Now imagine all the line conditioning charges you won't have to pay your common carrier.

Q. How can I go about proving the superiority of IBM modems?

A. Take your most troublesome line and put IBM modems on it. We believe you'll see an impressive improvement. Which leads us to another benefit of superior modems—you'll spend less time troubleshooting your network simply because line conditions that once were considered problems aren't really problems any more.

There are a number of other good reasons why you should consider IBM's line of 2,400, 4,800 and 9,600 bps stand-alone and rack-mounted modems. Not the least of which is that we've recently announced two new modems—the IBM 3833 and 3834—which feature lower prices, smaller packaging and improved serviceability. And like all IBM modems, they can fully utilize IBM's Communication Network Management capability.



The New IBM Modems

	IBM 3833	IBM 3834
Transmission Speed (bps)	2400 (full speed) 1200 (half speed)	4800 (full speed) 2400 (half speed)
Compatibility	3833, 3863-1,* 3868-1	3834, 3864-1,* 3868-2
LED Diagnostic Indicators	standard	standard
Communication Facilities	4-wire, point-to-point or multipoint	

Both modems operate over unconditioned telephone lines that can be leased (common carrier or PTT) or private.
*Must be in native mode. For full diagnostic capability, must be equipped with the Extended Diagnostic feature.

What's more, we've also recently lowered the prices of the IBM 3863, 3864, 3865 and 3868 Modems by as much as 29 percent. And there are also volume discounts available. If you're looking for modems that offer reliability, can improve end user productivity and are competitively priced, talk to your IBM marketing representative.

If you would like to receive a free brochure on IBM modems, call 1 800 IBM-3468, Ext. 90. Or use the coupon below. After all, it pays to be informed, because not all modems are created equal.

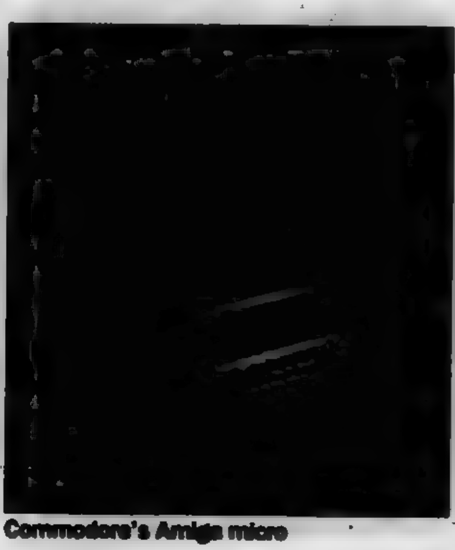
MICROCOMPUTERS

Graphics-oriented Amiga debuts



Commodore's Amiga micro

NEW YORK — Commodore Business Machines, Inc. late last month took the wraps off the much-discussed Amiga, a $1,295 machine that boasts leading-edge color graphics features and is designed for home and graphics-oriented business use.

Built around a Motorola, Inc. 68000 microprocessor and three proprietary chips that handle graphics and I/O functions, the Amiga provides a palette of 4,096 colors, available on-screen simultaneously in a "hold and modify mode," and with a maximum resolution of 640 by 400 pixels.

Scheduled to ship in September, the base system is said to include 256K bytes of internal memory — expandable to 512K bytes — and an internal 3½-in., 880K-byte floppy disk drive.

The micro also features an 89-key keyboard, parallel and serial ports, a system expansion port with full access to the 68000 bus, a mouse, two joystick ports, two stereo audio jacks and built-in text-to-voice and music synthesis capabilities, Commodore said.

The base system weighs 12½ lb and does not include a monitor. A red-green-blue (RGB) monitor is available for $495. Three video ports are provided: analog RGB, National Television Standards Code (NTSC) for a standard TV via a radio frequency modulator and NTSC composite video. An external floppy disk drive port supports up to three additional drives, including a mix of 3½- and 5¼-in. drives, the company said.

The Amiga comes with the Amiga DOS multitasking operating system, Amiga Basic and Amiga Tutor. More than 20 software applications will be available from Commodore when the system ships, and

Nestar to unveil Plan 5000 multifunction micro server

PALO ALTO, Calif. — Nestar Systems, Inc. is scheduled today to introduce the Plan 5000, a multifunction server for the firm's microcomputer local-area networks that can be expanded to provide 1.1G bytes of disk capacity.

The server, available immediately, is aimed primarily at large corporations with existing local-area networks "[that] understand the need for the kind of storage they have on the mainframe," commented Peter Hertan, Nestar vice-president of marketing.

Depending on the application, up to 254 workstations can be supported by the Plan 5000, which typically handles 25 to 50 workstations per server, Nestar said. Multiple servers may be configured on the network.

The starting configuration of the Plan 5000, priced at $25,000, is said to offer 275M bytes (formatted) of end-user storage capability, a 60M-byte streaming tape drive for backup, Nestar Shadow support for a secondary file server providing fault-tolerant capability, an integrated print server coprocessor that can drive three printers simultaneously and the server console.

The base system also features the Planpak starter library of network applications, including Software Connections, Inc.'s LAN:Datastore and LAN:Mail Monitor and Sorcim/IUS Micro Software's Supercalc and Superwriter packages, Hertan said.

A Plan 5000 with 550M bytes of storage costs $35,000, a version with 825M bytes costs $45,000 and the top-end model with 1.1G bytes costs $55,000. A second 60M-byte tape drive costs $2,000.

The server is compatible with Nestar's Plan 3000 and 4000, the company said. The Plan 5000 will support the IBM PC Network in two ways, Hertan said. A version of the Nestar network interface card that emulates the PC Network card is scheduled for commercial release in the fourth quarter. A network software up-

MICRO BITS
Thomas Madron

Memory needs still expanding

How much memory does a micro need? As much as it can get.

From the very beginning of modern computing in the 1940s, industry observers and participants have misjudged end-users' needs and their capacity to make use of computer resources.

From the beginning of the micro revolution in the 1970s, commentators have expressed doubt that users' needs justified

WHO IS THE WORLD LEADER IN IBM/38-36 BACKLOG REDUCTION?

FUSION

The world's most successful companies have made Fusion Products International the leading supplier of query/report-processor, PC interface and spreadsheet software for the IBM System/34/36/38.

Why is Fusion number 1, worldwide? Because we fully support the PC. Because we're one of the few S/38-36 vendors who actually answer their customer-service telephones. Because we offer on-site training. Because *easy-to-use* means never having to read your manual. Because selected Fusion products are available in many languages. Even Japanese.

That's why the leading software company in Japan selected Fusion as their *only* S/38-36 report processor. The *best and brightest*, everywhere, choose to spend their valuable time on business issues, not on computer issues.

You probably know our name. Isn't it time you made a most important phone call? Isn't it time you used Fusion power to obliterate your backlog?

FUSION

Fusion Products International 900 Larkspur L.C. Suite 295 Larkspur, California 94939 Telephone 415 461-4760 Telex 176880. Also in New York and Newport Beach.

Supercalc3 version out

SAN JOSE, Calif. — Sorcim/IUS Micro Software has announced Release 2.1 of its Supercalc3 integrated spreadsheet for the IBM Personal Computer line. The enhanced version, priced at $395, allows users to access memory of up to 8M bytes offered by Intel Corp.'s Above Board expanded memory capabilities.

According to the vendor, Supercalc3 2.1 also supports AST Research, Inc.'s Rampage expanded memory board and IBM's Enhanced Graphics Adapter and Enhanced Color Display.

Enhanced capabilities have been added to Sorcim's Fastmath recalculation functions, which now support the Intel 8087 and 80287 math coprocessors, the vendor said.

Supercalc3 incorporates the integrated graphics, data management and macro file capabilities introduced in earlier Supercalc releases, the vendor said.

Supercalc3 requires two floppy disk drives, or a hard disk and one floppy drive, and 96K bytes of random-access memory.

The product comes with Sorcim's Sideways printing utility that can permit horizontal report printing, the vendor said.

Sorcim/IUS Micro Software is located at 2195 Fortune Drive, San Jose, Calif. 95131.

Zenith Data Systems cuts prices on line of micros

GLENVIEW, Ill. — Zenith Data Systems Corp. recently announced price reductions on its Z-158, Z-148 and Z-138 personal computers, which were scheduled to ship last month.

Suggested retail prices for the Z-158 personal computer have been adjusted from $2,499 to $2,199 for the single-drive 128K-byte version.

The dual-drive, 256K-byte version was reduced from $2,899 to $2,499, and the 10M-byte Winchester hard disk drive version has been cut from $4,099 to $3,699.

Pricing for the entry-level IBM-compatible Z-148 personal computer dropped to $1,499 from $1,899 for the single-drive system and to $1,799 from $2,199 for the dual-drive version.

The Z-138 transportable personal computer with a 5¼-in. floppy disk drive was reduced to $1,699 from $1,999, the vendor said.

The Z-138 dual-drive model is now priced at $1,999, down from $2,299, Zenith Data Systems said.

Zenith Data Systems is located at 1000 Milwaukee Ave., Glenview, Ill. 60025.

Bluebird compiler allows mini applications to run on IBM micros

CARLSBAD, Calif. — Bluebird Systems announced a compiler that creates IBM Personal Computer versions of minicomputer applications.

DBComp/286 enables applications written with Bluebird's Databus programming language for Datapoint Corp. minicomputers to run on microcomputers with Bluebird's Superdos operating system, according to the vendor. The compiler converts source code directly into machine code so it can be compiled on a microcomputer.

An IBM Personal Computer AT with Superdos reportedly can support as many as 24 users and supply up to 840M bytes of disk storage.

The compiler costs $795 for an IBM Personal Computer or Personal Computer XT version and $1,495 for a Personal Computer AT version.

Bluebird is located in Suite A, 6352 Corte Del Abeto, Carlsbad, Calif. 92008.

Pop-Up out for IBM line

BELLEVUE, Wash. — Bellsoft, Inc. has added Pop-Up Word to its line of background utility programs for the IBM Personal Computer line. The software functions as a full screen editor and notepad suitable for schedules, "to-do" lists and telephone lists.

Pop-Up Word includes an Ascii file editor that can be used to read and write text portions of other file formats, according to Bellsoft.

The editor works with any Ascii file, including batch and word processing files.

The package's word processing features include block operations, search, replace and delete functions. Text can be cut and pasted from the editor to an on-screen application, Bellsoft said. Lines can be inserted or deleted by a single keystroke.

Pop-Up Word accepts commands from Micropro International Corp.'s Wordstar, in addition to offering its own command set.

The package can store from 4K bytes to 23K bytes of text. Text resides in a virtual area that can be unformatted or formatted in columns, according to Bellsoft.

Pop-Up Word requires 40K bytes of random-access memory and costs $39.95.

Bellsoft is located at 2820 Northup Way, Bellevue, Wash. 98004.

Announcing Masterpiece:™ A Powerful Mainframe Application Software Product Built Upon A Simple Idea Called Intelligent Architecture.™

What do you call a mainframe application software product designed with such patient attention to detail that it will register the effects of one transaction on every other business transaction in a company?

What do you call software architecture so artfully conceived it will someday enable a person using an application to move from one database management system to another, or from one teleprocessing monitor to another, without a single change in his work style?

What do you call query and reporting tools so simply and powerfully rendered that even a novice will find them no more difficult to work with than a personal computer spreadsheet?

Only one name fits…

Introducing Masterpiece.

The Masterpiece series is a family of mainframe business software products—a classification and a category which may lead you to conclude that it is like other mainframe software products.

Don't leap to that conclusion.

The Masterpiece design is so clean and uncluttered that it makes current and future applications efficient to develop and easy to use. Masterpiece comes with none of the excess baggage, inherent short-comings or system limitations that have traditionally plagued the people who need business information and the people who manage it.

Masterpiece is, in every aspect, a new family of software products.

And, in every aspect, an *improvement* over the software packages you may be used to.

Or are, in fact, now using.

Intelligent Architecture Design: The Fundamental Difference.

Previous software designs have been developed to better utilize the power of the computer.

Masterpiece was designed to mirror the methods and styles of the work place and to anticipate the *inadequacies* of the computer.

Masterpiece design is called Intelligent Architecture. It's a new term. And a new way to build software. Now, Intelligent Architecture brings new meaning to concepts like "modularity," "borderless integration" and "event-oriented processing."

Only application-specific code is contained in the application…other coding (system code, interfaces, code common to multiple applications) is separated out and coordinated by the Intelligent Architecture itself.

This means that ultimately a user can adopt a new database management system without the slightest change in either his way of working or in the application code itself.

Only software built in this manner, is software that will endure.

The Intelligent Architecture design means that all menus and screen prompts become common to all Masterpiece applications. It means that the way users interact with an application will be the same from application to application—a significant factor contributing to greater ease-of-learning and ease-of-use.

It is this capacity, present now in the Masterpiece Intelligent Architecture design, that lifts Masterpiece beyond the promise of other software products in its class.

And *that* is the fundamental difference.

Masterpiece is a trademark of Software International Corporation. Intelligent Architecture is a trademark of Software International Corporation. MasterQuery is a trademark of Software International Corporation. MasterSecurity is a trademark of Software International Corporation.

Masterpiece: Common Functions.

The reason Masterpiece works so well is because each of its pieces work so well together.

And apart.

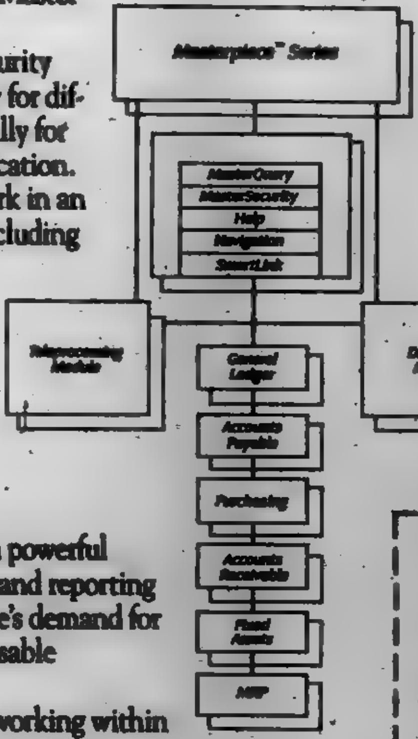
The MasterSecurity™ system, Online Help and Navigation features work across (and are common to) all Masterpiece applications.

But because they are separate from all applications, Online Help, for example, can be custom modified or even translated into different languages.

The Navigation feature lets you move from screen to screen with direct access from one Masterpiece application to another.

Levels within the MasterSecurity system can be determined not only for different applications but set specifically for transactions within the same application.

Everything is designed to work in an intelligent and modular fashion including what may now be the industry's most advanced query tool… MasterQuery.™



MasterQuery System.

The MasterQuery system is a powerful fourth generation borderless query and reporting tool designed to satisfy an executive's demand for instantly accessible and instantly usable information.

MasterQuery gives a person working within one application the ability to access information from another (accounts payable while working on general ledger, for instance) and to merge information from separate applications in a single report.

It also gives that person the ability to arrange his information in whatever form, format, or fashion he chooses. In whatever sequence or order. With whatever computations or projections he wants to make. With only the barest bit of computer know-how.

Masterpiece Integrated Applications.

The Masterpiece series will include these fully integrated, functionally rich business applications: General Ledger, Accounts Payable, Purchasing, Accounts Receivable, Fixed Asset Accounting, and MRP software products.

Masterpiece: The Promise The Future Holds.

The Masterpiece series is truly "built from the ground up" software. Because its architecture is so well thought through it anticipates future enhancements and applications. Because it's a product designed to be completely modular and infinitely *improveable* it represents a real value over the long term.

It won't, in short, fall prey to technological or design shortcomings. Won't dead-end at some point. Won't fail to perform as your needs expand.

For a Masterpiece demonstration, clip the coupon below or call toll free 1-800-343-4133 (in Massachusetts, call 1-800-322-0491) and arrange to attend a Masterpiece executive briefing.

The sooner you call, the further ahead you'll be.

Microsoft offers compiler for micro Basic interpreters

Boasts faster execution speed

BELLEVUE, Wash. — Microsoft Corp. has introduced Microsoft Quickbasic Compiler, a $99 Basic compiler said to be compatible with the Basic Interpreter sold with IBM Personal Computers, Compaq Computer Corp. systems and other IBM-compatible microcomputers.

Quickbasic reportedly executes at an average of three to 10 times faster than the Basic Interpreter. The software also supports structured programming features, large programs, extended MS-DOS functions, boosted graphics capability and local-area networking, the company said.

More than 3.5 million microcomputers have been shipped with some version of Microsoft Basic, and the company estimated that between 500,000 and 750,000 personal computer users write Basic programs.

"There's an immense amount of code which Quickbasic will compile," said Steven Snyder, director of language systems.

Programming features

Among the new structured programming features, Quickbasic provides alphanumeric labels and does not require line numbers, removing Basic's "single most-talked-about liability" on the IBM Personal Computer, Snyder said.

Lines are executed in the order listed, permitting Quickbasic to work with more powerful editors and making the code more readable, and users can avoid the GOTO and GOSUB commands disparaged by many programmers.

Additionally, users now can break up large programs into subprograms, which can be called by name and passed parameters (by reference or value).

Subprograms can work with either their own local variables or share global variables with the main program, according to Microsoft. Subprograms can be compiled separately and then linked with the main program before it is run, speeding development time, according to Snyder.

Users can create libraries of separately compiled modules, he noted. Multiline functions and standard Basic control structures also are available.

While the Basic Interpreter requires code and data to fit within 64K bytes, Quickbasic permits data to take up to 64K bytes, with code restricted only by the amount of random-access memory (RAM) available, said Rob Dickerson, group marketing manager.

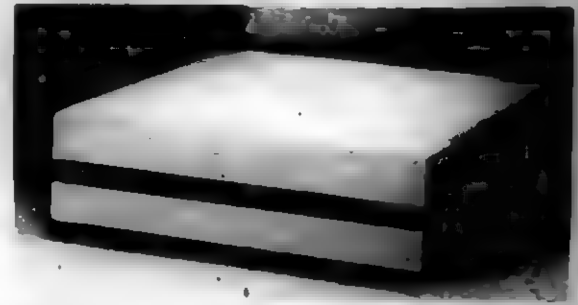
Quickbasic reportedly also supports the IBM Basica Interpreter's graphics and sound statements, along with additional MS-DOS features including SHELL, path names and subdirectories. Additionally, hooks for MS-DOS 3.1 networking are provided, including file and record locking and file access control.

Quickbasic runs on the Personal Computer, Personal Computer XT, Personal Computer AT and compatible machines. The software is scheduled to ship early this month. It requires PC-DOS or MS-DOS 2 or higher and 128K bytes of RAM (with a recommended minimum of 256K bytes).

Microsoft can be reached through Box 97200, 10700 Northup Way, Bellevue, Wash. 98009.

"This is not the way you were taught to cope with stress!"

THE NIU-180 LOWERS COST-PER-CONNECTION.



Announcing the NIU-180: the first of an extraordinary new family of Network Interface Units that represents a direction everyone's been waiting for in local area networking. *Much higher performance. Much lower cost.*

In terms of cost-per-connection, the eight-port NIU-180 is the lowest ever.

In areas where equipment is concentrated, the NIU-180's eight RS-232 ports bring per-connection local area network costs to a new low.

With 16-bit architecture and advanced VLSI, we've packed more memory, more functionality, and more flexibility than ever before into a single unit. At substantially reduced costs.

Because these are Net/One® NIUs, the connections can be with the medium of your choice. Broadband, baseband, optical fiber.

And because these NIUs® are Net/One products, they are a compatible extension of Net/One. The only difference is even higher performance than you've come to expect from what was already the high performance standard. More speed. More power. Less money.

Use of CAD tools on micros to double by 1990: report

Of CAD users, 32% run tools on micros

By Edward Warner
CW Staff

SUDBURY, Mass. — The installed base of computer-aided design software running on personal computers will double in five years, according to a recently released report from Technology and Business Communications, Inc., a firm here that specializes in the computer graphics market. Presently, the report said, only 32% of firms that use CAD are running it on personal computers.

The report, titled "Doing CAD on a Personal Computer: A Market Study," also predicts that in five years mechanical designers will be the primary users of CAD, taking 38% of the market, though they today claim only 24% of the market.

The use of personal computer-based CAD for electrical design makes up the largest share of the market today at 26%, but will decline to 20% of the market by the decade's end, the report said.

The report, according to Technology and Business Communications President Stanley Klein, summarizes data from about 260 questionnaires returned in a mail survey of personal computer CAD vendors and from individual interviews with personal computer CAD vendors and researchers in the personal computer CAD market.

No potential personal computer CAD users, such as manufacturing or electronics firms, were surveyed, Klein said, because "users don't really assess market growth. [They] are just aware of their own growth."

Klein said his prediction of a surge in the growth of personal computer-based CAD is due to "two things: [the spread of] the distributed processing concept and the stand-alone going into places that heretofore couldn't afford such systems."

Technology and Business Communications also released recently a report that offers background on personal computer-based CAD and advice on whether new users should purchase personal computer CAD as a turnkey system or in piecemeal fashion. That report, "Doing CAD on a Personal Computer," also notes the advantages and disadvantages of using personal computer-based CAD.

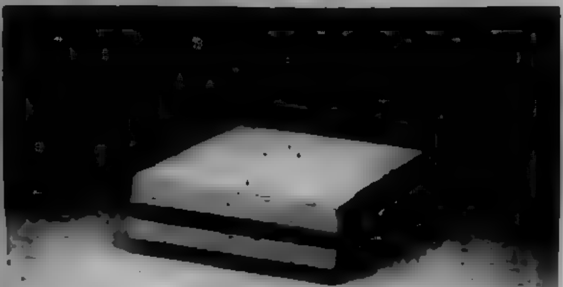
Among personal computer-based CAD's advantages, the report said, are ease of use of many of the personal computer CAD programs, desktop access and generally low cost when compared with minicomputer-based CAD.

The disadvantages are said to lie in scaled-down performance. Personal computer-based CAD offers slower speeds and more limited applications than minicomputer-based CAD.

"Doing CAD on a Personal Computer" is priced at $179. The personal computer CAD market study costs $329.

Technology and Business Communications is located at 730 Boston Post Road, Sudbury, Mass. 01776.

THE NIU-130 LOWERS COST-PER-LOCATION.



Announcing the NIU-130: a two-port NIU that can follow you anywhere at a cost-per-location so reasonable that network connection is feasible where it hasn't been before—particularly in broadband applications.
A one-person station on the production floor. An isolated office. A surveillance site.

The NIU-130 unplugs and moves with you easily, and is, like all Net/One products, media-independent.

It takes full advantage of VLSI as well as 16-bit architecture to do more than a single NIU has ever been able to do before. More features. Higher performance. At a cost that keeps the total system cost way down, even when you have to make connections way out.

Give us a call. Ungermann-Bass, Inc., 2560 Mission College Blvd., Santa Clara, CA 95050, (408) 496-0111. Western Region (408) 496-6464. Eastern Region (703) 448-1117. International Offices: Lausanne, Switzerland (021) 267733; Tokyo, Japan (03) 585-5485; Toronto, Canada (416) 494-4426.

costs down and
ere you want them.

PLAN

from page 43

grade for Nestar servers, permitting networks to run either Plan or PC Network software, also will be delivered by year's end.

In addition, Hertan said, Nestar expects to provide an upgrade to its networking products allowing them to work with IBM's forthcoming token-ring network within the next 12 months.

More information is available from Nestar at 2585 E. Bayshore Road, Palo Alto, Calif. 94303.

"I knew it wasn't working properly when it wouldn't work."

AMIGA

from page 43

more than 75 developers are writing for the system, according to the vendor.

An optional software emulation package available in October reportedly will allow the machine to run off-the-shelf IBM Personal Computer software, although performance will not be as good as it is on the IBM machine. Additionally, an accelerator plug-in module will increase the speed of the IBM software on the Amiga.

Each option will cost less than $100, the company said.

Future options will reportedly include a variety of printers, a color digitizer and a genlock unit for synchronizing the Amiga with an external video device such as a laser disk or videotape player.

When these become available, developers will be able to "intertwine such standard features as four-channel audio, digitized images, animation, video synchronization and a palette of [more than] 4,000 colors," Commodore said.

Third-party options reportedly will include a 20M-byte hard disk drive, a 20M-byte tape backup, a 1M-byte multifunction card, a 2,400 bit/sec. modem and a graphics tablet.

Additional information is available from Commodore Business Machines, which is located at 1200 Wilson Drive, West Chester, Pa. 19380.

BYTES

from page 43

the increases in memory from 64K bytes to 128K bytes and finally 256K bytes, offered by vendors. Next they downplayed the Intel Corp. 80286 microprocessor's ability to address 16M bytes of real storage and up to 1G byte of virtual storage.

Not surprisingly, the critics are now contending that Intel's forthcoming 80386, expected to address 4G bytes of real storage and 64T bytes of virtual storage, represents overkill.

Few applications currently make use of the 80286's capacity to handle 16M bytes of real storage. Of course, there is no widely accepted multitasking operating system yet available for machines such as the IBM Personal Computer AT that use the 80286.

IBM's PC-DOS 3 and 3.1, which some observers once thought would have multitasking capabilities, turned out to be a single-tasking operating system.

AT&T's Unix, which might be a contender, has little end-user appeal, in part because little applications software exists to run on it, and for a business environment, Unix is so actively user-hostile as to be useless without a custom shell. Perhaps PC-DOS 4 will be a multitasking operating system.

Digital Research, Inc. offers Concurrent DOS, but because the vendor does not have the imprimatur of IBM, the product has not met great commercial success.

A multitasking operating environment could bring forth a new generation of applications for personal computers. To do the job well, however, such an operating system must run on a processor with sufficient speed and power to keep everything moving at an acceptable performance level.

As operating systems for micros become more sophisticated and complex, we can expect system overhead to continually take more space. IBM demonstrated this trend with its mainframe systems.

When the 360 series of computers was first introduced, memory of 64K bytes was not uncommon and the operating systems could run in such machines. OS/MFT actually required a bit more to leave enough for applications. The successor to OS/MFT on today's IBM mainframes, OS/MVS, requires 1M byte or more of storage but provides more services than its predecessors.

This trend is visible with microcomputer operating systems; one illustration is the difference between the memory requirements of PC-DOS and Unix.

The development of low-cost laser disk storage will likely provide the external media necessary to make use of the virtual storage capacity inherent in both the 80286 and the 80386. Low-cost read-only laser systems have already been announced for the personal computer market for introduction in mid- to late 1985.

High-cost, high-performance micros are precursors of the larger, faster machines of the near future. Those who question the need for more memory and faster processors simply don't understand modern computing.

UNIX SYSTEM V. SOFTWARE THAT STACKS UP.

High-quality application software written for UNIX System V is available now. And new business programs are continually being developed.

That means increased market opportunities for VARs and ISVs. And end users can be certain their investment in a UNIX System V-based computing system is a smart, sound one.

Quantity and quality

The market for products that are based on UNIX System V has grown significantly over the last two years. There are now hundreds of packages written for UNIX System V. And this growth will continue.

Quality applications—general business packages and development tools—are now available for the AT&T UNIX PC. And AT&T is putting together even more hardworking, industry-specific software to run on AT&T 3B2 and 3B5 Computers.

With so many packages available, VARs can offer more turn key systems based on UNIX System V to an ever-growing customer base. ISVs can sell software to even more customers. And end users can invest in a UNIX System confident there is plenty of quality software available.

Software you can bank on

UNIX System V has gained acceptance as a powerful, versatile computing standard. More hardware vendors like NCR, Altos, Motorola, Perkin-Elmer and Sperry are joining AT&T in offering products based on UNIX System V.

And we've introduced the System V Interface Definition. Software written under the Interface Definition can run on current and future releases of AT&T's UNIX System V, as well as various System V derivatives offered by AT&T licensees. So there will be an even larger, more comprehensive base of portable software from which to choose.

Our comprehensive UNIX System V Software Catalog lists a full range of packages that run under UNIX System V. For end users it's a reference guide to the programs available. And for developers it's a smart way to ensure packages will have even greater exposure to the growing UNIX System V market.

To learn more about UNIX System V market opportunities, order the UNIX System V Software Catalog—at $19.95 plus tax. Call 1-800-432-6600 and ask for Operator 387.

UNIX System V. From AT&T. Consider it standard.

AT&T
The right choice.

Panel lauds fiber-optic net benefits

By John Dix
CW Staff

High data rates, immunity to electrical interference, low bit-error rates and small size are all factors that will fire the acceptance of fiber-optic local networks, according to a panel of experts at the National Computer Conference last month.

Obstacles to that acceptance remain, however, according to James Bryce of Netserve, an Austin, Texas, communications consulting firm. Bryce, who chaired the session called "Fiber Optics in Local-Area Networks," said it is still hard to splice and tap fibers, and further work is needed in the area of transceivers. The most dire need is for standards, Bryce said.

However, the inherent benefits of fibers shine through these present shortcomings. Although initial local network data rates will be around 30M bit/sec., the medium has the potential to exceed 1 billion bit/sec. while sustaining bit-error rates of 10 to the negative ninth or 12th, Bryce claimed. These capabilities, coupled with fibers that are immune to electrical, magnetic and radio frequency interference, make fiber optics attractive for certain applications.

Michael See of IBM's Research Triangle Park in North Carolina, explained how fiber optics can be used in token-ring networks like the type the mainframe maker is reportedly developing. Initially, fibers will be used between distribution points, See said. Eventually, however, fiber can be extended from these hubs to workstations in a star topology. Although the network will physically resemble multiple interconnected wagon wheel hubs with spokes, data will flow in a logical ring, running from one device back to the distribution center and to the next workstation. The wire centers enable workstation spokes or lobes to be bypassed in the event of a loop problem, See explained.

When installing fiber, it is important to ensure that the cable can accommodate future growth, See cautioned. He said the data rates of early fiber nets will be roughly 30M bit/sec., but the medium should be able to handle three generations of information processing equipment, each with a life cycle of five years.

See predicted that LEDs instead of lasers will be the primary light source for use with fibers and that the industry will standardize on the use of photo diode detectors to interpret the light signals and

M/A-Com tool joins Ethernet, broadband nets

GERMANTOWN, Md. — M/A-Com, Inc.'s Telecommunications Division has announced Etherplus, a system that enables an Ethernet-type network to be implemented on a broadband network.

Etherplus is said to be compatible with Ethernet and IEEE 802.3 controllers, protocols and software. Etherplus products include transceivers for single- and dual-cable systems and head end frequency translators.

The Etherplus EP-8100 series of broadband transceivers are used on mid- or high-split single-cable broadband systems, and the EP-8200 transceivers are used with dual-cable implementations. Single-cable systems also require use of the EP-8900 frequency translator, a head end that converts signals from the transmission band to the reception band.

Both types of Etherplus broadband transceivers replace the typical baseband Ethernet transceiver and emulate their function, although there is a delay between transmission and reception because of the inherent characteristics of broadband systems, the company reported. The Etherplus transceivers connect to IEEE 802.3-type controllers with the same multipair cable used to connect baseband transceivers.

The transceivers transmit at 10M bit/sec., with a low bit-error rate and 100% collision detection, a spokesman said. The EP-8100 and 8200 are compatible with the proposed IEEE 802.3 broadband 10M bit/sec. carrier-sense multiple access with collision detection standard.

When used with the EP-8900 frequency translator, the single-cable EP-8100 transceivers will operate over a distance greater than 3,600 meters. The dual-cable EP-8200s boast the same capability. Any node may be up to 1,800 meters from the broadband head end.

The EP-8900 has I/O attenuators that allow adjustment of the translator gain for optimum system operation with different inbound and outbound path losses. The devices include ports for an external monitor and switch-over unit and a test port that allows direct connection of an Etherplus single-cable transceiver for operational checkout.

The EP-8900 mounts in a standard 19-in. rack with 5¼-in. panel height.

The EP-8100 costs $3,975; the EP-8200 costs $3,625; and the EP-8900 costs $4,500, the vendor said. All products are available eight weeks after ordering.

M/A-Com Telecommunications Division is located at 11717 Exploration Lane, Germantown, Md. 20874.

Firm offers NCR-IBM link

System provides path to host CPU via SNA

MIAMI, Fla. — Innovative Electronics, Inc. has announced the Retail Netmaster system for interfacing NCR Corp. point-of-sale (POS) terminals to an IBM host through IBM's Systems Network Architecture (SNA).

The Netmaster system consists of the Netmaster/AP and Netmaster/IS. The Netmaster/AP is a host-resident Cobol applications program that performs configuration, control and monitoring of the network.

The Netmaster/IS is an in-store multifunction computer that supports NCR terminals and provides the interface to IBM or Amdahl Corp. SNA hosts equipped with IBM CICS/IMS software.

Network backbone

The Netmaster/IS processor allows the retailer to establish a network backbone for the authorization of credit cards and functions involving data collection.

The central Netmaster/AP and the remote Netmaster/IS together act as a real-time regulator to maintain the quality and flow of data from the in-store terminals to the host computer, the company reported.

The products are said to free the host and enable it to process individual transmissions more quickly.

Netmaster is said to carry out general merchandising functions, to eliminate the need for IBM 3270 and 721, 724 and 725 processors and to provide SNA/Synchronous Data Link Control to NCR or Burroughs Corp. Poll/Select protocol conversion.

Preprocesses POS terminal data

Netmaster is also said to preprocess POS terminal data, to reduce mainframe processing and to store remotely POS data to maintain mainframe efficiency during peak hours.

The price of the Netmaster system ranges between $8,000 and $10,000 for each store, according to the vendor.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

AT&T satellite-based data transmission service debuts

BASKING RIDGE, N.J. — AT&T recently began offering a private digital satellite service for data communications applications ranging in speed from 56K bit/sec. to multiples of 1.54M bit/sec.

Skynet Digital Service is offered over AT&T satellites with earth stations provided through a comarketing agreement with Vitalink Communications Corp. of Mountain View, Calif.

The service will enable users to establish private digital multipoint networks using the earth stations that are installed on the customer's premises.

On a 5-year lease, these 6-meter earth stations cost $3,810/mo for speeds ranging up to 384K bit/sec. and $5,500/mo for stations capable of supporting speeds from 768K bit/sec. to 1.54M bit/sec.

Cost varies by speed

The space segment of the service varies in cost by speed. The monthly costs of simplex, one-way channels are $900 for 56K bit/sec., $1,000 for 64K bit/sec., $1,800 for 128K bit/sec., $2,500 for 192K bit/sec., $3,200 for 256K bit/sec., $4,800 for 384K bit/sec., $6,000 for 786K bit/sec. and $9,000 for 1.54M bit/sec. channels.

The highest speeds are also available with a usage-sensitive billing alternative — 786K bit/sec. costs $50 per half-hour/simplex channel, and 1.54M bit/sec. costs $70 per half-hour/simplex channel.

Customers using Skynet Digital Service can interconnect these private networks with AT&T's Accunet Reserved 1.5 Service.

AT&T offers this digital 1.54M bit/sec. service between 42 U.S. cities and with links to the UK, France and Canada. This would enable a location that does not have its own earth station to participate in a videoconference, AT&T said.

The service is available now.

AT&T Communications is located in Basking Ridge, N.J. 07920.

Datastream slashes prices on BSC, SNA controllers

SANTA CLARA, Calif. — Datastream Communications, Inc. has reduced prices on its family of IBM-compatible Binary Synchronous Communications (BSC) and Systems Network Architecture/Synchronous Data Link Control (SNA/SDLC) 3270 controllers by an average of 25%.

The 774 line, formerly ranging in price from $7,900 to $15,000, will be priced from $6,500 to $12,900, depending on configuration. These controllers come with 128K bytes of memory and support one or two host links and up to 24 Ascii device ports.

The 776 line of BSC 3270-compatible controllers, formerly priced from $4,500 to $7,000, are now available from $1,950 to $2,950, depending on configuration. The 776 line supports one BSC host link, up to nine Ascii device ports and up to 64K bytes.

The 874 line of SNA/SDLC 3270-compatible controllers, formerly ranging from $10,950 to $16,950, are now available from $8,900 to $14,400. The 874 line supports one or two SNA/SDLC host links, up to 16 Ascii ports and 512K bytes.

Datastream is located at 2520 Mission College Blvd., Santa Clara, Calif. 95050.

Western Union discounts

UPPER SADDLE RIVER, N.J. — Western Union Corp. has announced Operation Bigpipe, a volume discount program for business customers with 10 or more analog or 24 Western Union Digital Optimized Wats lines.

A typical 24-line Digital Optimized Wats service is estimated to cost 40% less than AT&T's Wats service, a spokesman said. Optimized Wats is Western Union's wide-area long-distance telephone service for nationwide calling. Rates are based on the distance of a call.

For Operation Bigpipe, customers within a half a mile from a Western Union service center will be supported with local facilities procured from other carriers. On orders of 10 or more analog lines, the use of Western Union's interconnect facilities eliminate local facility charges, the company said. Customers who purchase 24, or multiples of 24, Digital Optimized Wats lines will save $31.64/line per month in port charges.

Where Western Union has existing connections between the customer's building and the local Western Union switch location, interconnect facilities are provided free of charge.

Western Union is located at One Lake St., Upper Saddle River, N.J. 07458.

FIBER

from page 51

convert them back into electricity. Although many types of fibers can be used, See recommended using fully graded 100/140 micron fibers, the first number representing the size of the fiber core and the second a measure of the fiber cladding.

Today most fibers of this type use light that has a wavelength of 850 nanometers. However, to support future generations of fiber-optic equipment, it is important to make sure the fiber being installed can support or is optimized for light with a 1,300-nanometer wavelength.

Howard Salwen, chairman of Proteon Corp., a Natick, Mass.-based manufacturer of a token-passing local network, said maintenance of fiber networks is a major concern. "Users are most interested in rapid fault isolation. Network modules should have enough intelligence to bypass faults."

> *'Users are most interested in rapid fault isolation. Network modules should have enough intelligence to bypass faults.'*
>
> **— Howard Salwen Proteon Corp.**

Salwen said the importance of fault isolation encourages use of a ring topology with fiber nets.

Access methods

Another concern dictated by characteristics peculiar to fiber optics is the access method used, Salwen said. Although many types can be used, the high speeds possible with fibers limit the use of methods like Ethernet-type carrier-sense multiple access with collision detection (CSMA/CD).

Token passing and CSMA/CD perform similarly at 1M to 10M bit/sec., Salwen said, but the Ethernet-type protocol collapses at 100M bit/sec., he maintained.

If 100M bit/sec. is not needed, a product from Siecor Corp. that uses CSMA/CD may fit the bill, according to Jay Cunningham, a Siecor product line manager. Siecor markets a passive star coupler that acts like a hub for interconnected workstation links. Within this hub, fibers are, in essence, tied together so that a light signal entering on one fiber will exit on all the other fibers.

Wrapping up the session, Michael Coden, president of Codenoll Technology, Inc., tried to leave the audience with the conviction that fiber-optic local networks are already a reality.

Codenoll, which markets fiber nets, has reportedly sold 20,000 interface transceivers and installed a number of large nets. A former Bell operating company, for example, has reportedly installed a 2,200-node fiber net that will eventually support 5,000 nodes.

DOS/VSE and CICS/VS Frustration?

BIM gets it out of your system.

BIM presents a line of proven programs that maximize your system's capabilities, saving you time, labor and expense. These program products help get the most out of your system and people.

BIM-EDIT — the editor with more than 25 significant features that ICCF can't match.
BIMSPOOL — Prints output in POWER/VSE spooling queue on local or remote 3270 terminal printers. (Received ICP Million Dollar Award 1983).
BIMSPOON — On-Line to Batch Print Spooling. Prints data passed from CICS application programs into the POWER spooling queue.
BIM-PDQ — POWER Dynamic Queuing performance enhancement. Eliminates 89% of the I/O to heavily used POWER queue.
BIM-ODIS — Comprehensive problem analysis and display of operational CICS system. DOS and OS.
BIMTEXT — Word processing, document composition system. Create formatted documents from free-form input.
BIMWINDOW — Multiple terminal sessions concurrently at CRT under DOS or OS VTAM.
BIMSWAP — Switch local 3270 BTAM terminals between multiple CICS partitions without special hardware or additional ports.
BIMCMPRS — CICS 3270 data compression system. Reduces response time for remote terminals significantly. Available for OS/VS1 and MVS also.
BIMECHO — Copies one CRT's output to another or printer for problem determination and demonstration.
BIMP3270 — Comprehensive CRT screen image print facility. Copy to terminal printers or spool queue for system printer.
BIMSERV — On-line display of library directories and entries, VSAM Catalog entries, disk VTOC's, etc.
BIMCNSOL — Multiple/Remote System Console function for CICS. Display-only or full input/display versions available.
BIMMONTR — DOS/VSE System Status, Performance Measurement, and POWER Queue display.
BIMSUBMT — On-line Job Edit and Submission facility.

BIM programs are cost-efficient, many less than $900, highest $4000. You can save even more with our group package offerings. Products are available on permanent, annual, or monthly licenses, and shipped on a 30-day free trial basis. Product documentation is available on request.

BIM also performs systems programming consulting, with consultants based in Minneapolis and Washington, D.C. Computer time services are also available on our 4331-2 system, on-site or remote.

Reach 20,000 computer professionals in Mexico.

Advertise in CW Communications' Mexican publications and sell your products directly to Mexico's burgeoning computer community. According to International Data Corporation (IDC), the world's leading information industry research firm, there are over 21,000 computers in Mexico. CW Communications covers the Mexican market with two important publications; *Computerworld Mexico* and *CompuMundo*.

10,000 DP professionals in government, banking and industry read *Computerworld/Mexico*. Modeled after *Computerworld*, its sister publication in the U.S., *Computerworld/Mexico* is considered an excellent way for advertisers to reach a broad range of influential industry leaders. Twice each month, *Computerworld/Mexico* reports developments in hardware, software and terminals as well as industry trends.

CompuMundo covers one of Mexico's fastest growing market segments — microcomputers. Microcomputer growth is expected to jump 15% annually from its current base of 17,000. Each month 10,000 micro users and potential users turn to *CompuMundo* for the latest information on micros, programming and all the latest industry developments. Telecommunications and electronics specialists also rely on *CompuMundo* for up-to-date industry information.

CW International Marketing Services makes advertising your products in Mexico, and around the world, easy. We have over 50 publications in more than 25 countries around the world. For more information on our wide range of services, complete the coupon below and mail today.

Apollo laser printer out for Domain

BOSTON — Apollo Computer, Inc. has released a laser printer for use with its Domain workstations.

The Domain/Laser-26 prints up to 26 page/min of integrated text and graphics at a 300 dot/in. resolution, the vendor said. The printer is said to support the company's Domain local-area networking environment, and it can be configured as a shared resource anywhere on a transparent Domain network.

An integrated graphics processor contains an interpreter for Postscript from Adobe Systems, Inc. of Palo Alto, Calif. Postscript converts commands into images of text and graphics that the laser then transfers to the print engine drum.

The printer can be configured with an RS-232 serial interface or with a Centronics Data Computer Corp. parallel interface.

The Domain/Laser-26 costs $34,900 for the Centronics parallel interface version for Multibus connection and $31,900 for the RS-232 serial interface version. An upgrade kit to change from serial to parallel versions costs $4,000.

Apollo is located at 330 Billerica Road, Chelmsford, Mass. 01824.

Intel ships first five IPSC processor systems

By Donna Raimondi
CW Staff

BEAVERTON, Ore. — Intel Corp. has announced that it has shipped the first five systems of its Intel Personal Super Computer (IPSC) family of concurrent processors, based on multiple Intel 80286 microprocessors.

The initial customers — MIT; Oak Ridge National Laboratories; the Research Institute for Advanced Computer Science in Moffett Field, Calif.; the Supercomputer Research Center in Lanham, Md.; and Yale University — will use the IPSC to explore applications and algorithms in concurrent processing, Intel said.

The architecture of the IPSC family is based on the hyper-cube interconnect structure developed at the California Institute of Technology. The hyper-cube consists of multiple, independent computational nodes, each with memory, linked to other nodes by dedicated communications channels.

The ability of the nodes to do their work concurrently is said to provide the processing power necessary for computationally intensive scientific applications. Very large-scale integration components are said to lower the costs of computing and to provide familiar programming environments for researchers.

MIT plans to conduct research in numerical analysis and numerical methods, Intel said. It will use an entry-level IPSC D/5, which contains 32 computational nodes and 16M bytes of distributed memory. An MIT spokeswoman said the machine has been delivered but will not be officially accepted until a promised C compiler arrives.

Oak Ridge National Labs will use the IPSC D/5 in its mathematical and statistics research section to perform basic research for the U.S. Department of Energy.

According to Bob Ward, head of the mathematical science section at Oak Ridge, researchers there will test parallel algorithms in computational and numerical analysis such as sparse matrices and partial differential equations. Specific applications will include chemistry, solid-state physics, environmental modeling and artificial intelligence and robotics, Ward said.

The Research Institute for Advanced Computer Science will use an IPSC D/5 with 32 nodes to develop parallel programming methodologies for problems in computational fluid dynamics and computa-

HARD TALK

Jumping into the scientific minicomputer act

By Tom Henkel
CW Senior Editor

Aside from the big slump in computer sales, 1985 may well be remembered as the year that scientific-oriented minicomputers made an indelible mark on the computer industry. Everyone seems to be getting into the scientific act, either by bolstering the number-crunching performance of commercial systems or by developing innovative architectures that some believe will eventually replace the file-oriented von Neumann architecture that has been the mainstay of the computer industry for the past 20 years.

A major reason for users' voracious appetites for scientific-oriented systems is the increased corporate reliance on simulations and modeling, particularly at companies that design and manufacture products. The demand for computer-aided design and manufacturing systems will most likely remain brisk. But CAD/CAM is only the beginning. The next strong market for powerful minicomputers will be for artificial intelligence applications, such as expert systems and decision support systems.

For AI applications, an emerging class of systems that use multiple microprocessors seems to show a great deal of promise. These multimicrocomputer systems typically operate either as parallel processors or concurrent parallel proces-

Oracle announces portable version of IBM SQL/DS and DB2

Any application written for IBM's SQL/DS or DB2 relational database management systems will now run without modification on DEC, DG, AT&T, HP and several other manufacturers' minis, and a wide range of micros, including the IBM PC/XT and PC/AT.

Oracle Corporation introduced the first relational DBMS in 1979. Today ORACLE is the only relational database management system that is completely compatible with IBM's SQL/DS and DB2. Programs written for SQL/DS or DB2 will run unmodified on ORACLE.

Originally designed for IBM mainframes and DEC superminis, ORACLE is now available on a wide range of machines, from mainframes to PCs. And ORACLE includes an integrated set of 4th generation software tools not available with either SQL/DS or DB2.

● **Why not Cullinet, ADR or Focus?** There is a clearly defined standard for relational database systems. It's called SQL, and it's from IBM. Both ANSI and the US Government are in the process of adopting SQL as *the* standard database language. The Cullinet, ADR and FOCUS software packages each implement their own unique database language - each one painting the user into its own corner. Since its inception, Oracle Corporation has provided total IBM SQL compatibility.

Few shops nowadays run only IBM mainframes. Why, then, even consider a database solution that runs *only on IBM mainframes?* Applications written with ORACLE run identically on mainframes, minis, and PCs. Because all versions of ORACLE *are* identical.

FOCUS, Cullinet and ADR offer either a limited subset, a completely different product or nothing at all (respectively) for the PC. And none have minicomputer products.

● **Why not just go with DB2 or SQL/DS?** A relational DBMS simplifies but does not by itself eliminate application programming. Additional tools are necessary if users are to create and maintain their own applications.

DB2 and SQL/DS are relational systems, period. ORACLE is a relational DBMS plus integrated 4th generation software tools for application generation, report writing, color graphics and network communications.

Furthermore, SQL/DS and DB2 run only on IBM mainframes (and are somewhat unlikely ever to run on another vendor's system). ORACLE runs on more IBM hardware and operating systems than do IBM's relational products.

● **What about Goldengate, dBase III, Symphony or Framework?** PCs need more than PC software if they are to be usefully integrated with corporate data processing. Incompatibility with SQL, while serious, is not the only major problem with these micro packages. None provides an acceptable level of data security, integrity or recovery facilities. And their PC-to-mainframe links are functionally primitive and difficult to use.

To effectively link computers, all machines in the network should run the same software. Only ORACLE provides standard software on mainframes, minis and micros. Data and programs can then be shared among users of different machines, distributing the workload.

ORACLE is currently installed on over 1000 mainframe and supermini systems around the world, as well as on thousands of PCs. Oracle's customers include 8 out of the 10 largest U.S. corporations, as well as major foreign companies and government agencies.

For further information, contact Oracle Corp., Dept. C2, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350.

SCIENCE

from page 53

sors, giving users the ability to work on many different tasks at once. But the problem faced by vendors of such systems is a glaring lack of applications software specifically geared to the parallel, concurrent operating environment.

The right team

It is no secret that hardware and software are inseparable. Teaming up with the right applications software developer could easily push a vendor of a multimicroprocessor-based system into the forefront of the emerging AI business. A mistake could be disasterous.

Intel Corp., for example, has been very careful in selecting the first users of its Intel Personal Super Computer (IPSC) hyper-cube. It has chosen well-respected universities and government institutions that it hopes will do a credible job of investigating the properties of concurrent processing.

It is also clearly Intel's hope that in the process, these institutions will develop some highly desirable software for the IPSC. In the long run, the move will probably prove to be a good one. But it also seems to fly in the face of the traditional marketing techniques used to sell new systems.

> ”
>
> *The next strong market for powerful minicomputers will be for artificial intelligence applications.*

Intel seems to be deliberately holding back the number of IPSC systems it can deliver to users, even though Intel executives claim the demand for the system, especially among AI software developers, has been stronger than expected. The move is risky, because holding back deliveries poses the threat that the IPSC could be surpassed by a more innovative architecture from another company before it ever gets off the ground.

But at the same time, the move smacks of wisdom because a substandard AI system developed around the IPSC could damage the machine's — and Intel's — reputation.

The marketing technique being employed by Intel reflects the growing complexity of software and the profound impact it can have on a new hardware product. The effectiveness of programs used to be fairly easy to verify. If the program fulfilled its intent, and did so efficiently, it was probably acceptable for most applications.

Now, software not only performs a series of commands, it also analyses data and offers users advice.

The question that requires a great deal of scrutiny is whether that analysis and advice is correct. Some software experts are now urging that giving advice be constructed in such a way that the software can also tell the user how conclusions were reached.

But even with such explanations, it is clear that artificial intelligence software will have to be closely scrutinized not only by the user who must live with his chosen package, but also by the hardware developer whose reputation as a systems supplier can be affected by the companies that develop specialized packages to run on that system.

"He's a hacker all right — we brought him in to get our department some time on the mainframe."

System Industries unveils cache processor for VAX

MILPITAS, Calif. — System Industries, Inc. has launched a disk cache processor for use with all Digital Equipment Corp. VAX series superminicomputers.

The processor costs $15,000 and was designed to cache the most frequently and most recently used blocks of data to reduce data access time.

The unit, which is driven by the Motorola Corp. 68000 microprocessor and has its own 2M-byte cache, is said to eliminate head movement for up to 95% of all disk I/O. Average access time is less than 2 msec.

According to the vendor, the VAX's primary bottleneck, especially in I/O-intensive multiuser applications, is the VAX's ability to handle heavy data loads and disk access. The disk cache processor is said to result in up to a tenfold decrease in average access time.

The disk cache processor is said to be compatible with all System Industries Winchester, removable Winchester and removable media disk drives.

More information is available from System Industries, 1855 Barber Lane, Milpitas, Calif. 95035.

Meet the Members of
The INTERFACE '86

The leaders of an industry create the industry-leading show. This select board of outstanding professionals assures that INTERFACE '86, for the fourteenth consecutive year, will advance the state-of-the-art as the world's foremost industry forum for information/communications systems.

The INTERFACE '86 Program Committee, and more than 100 other leading experts, will present over 40 conference sessions on the vital issues facing today's management and professionals. Plus, the INTERFACE '86 exhibit floor will feature over 300 of the world's leading computer and communications-related companies.

SYSTEMS & PERIPHERALS

tional chemistry, said Mike Raugh, chief scientist at the center.

"We'll experiment with it and use it for learning to write parallel programs," he said. The National Aeronautics and Space Administration's Ames Research Center is sponsoring the research, he said.

The Supercomputing Research Center is said to be doing supercomputer research for national security purposes, a spokesman said. It will develop and evaluate parallel processing on the IPSC D/6.

Yale is planning research on multiprocessors in order to develop algorithms that make maximum use of the architecture. It will develop new programs and languages and determine what kinds of problems can be developed with the new equipment.

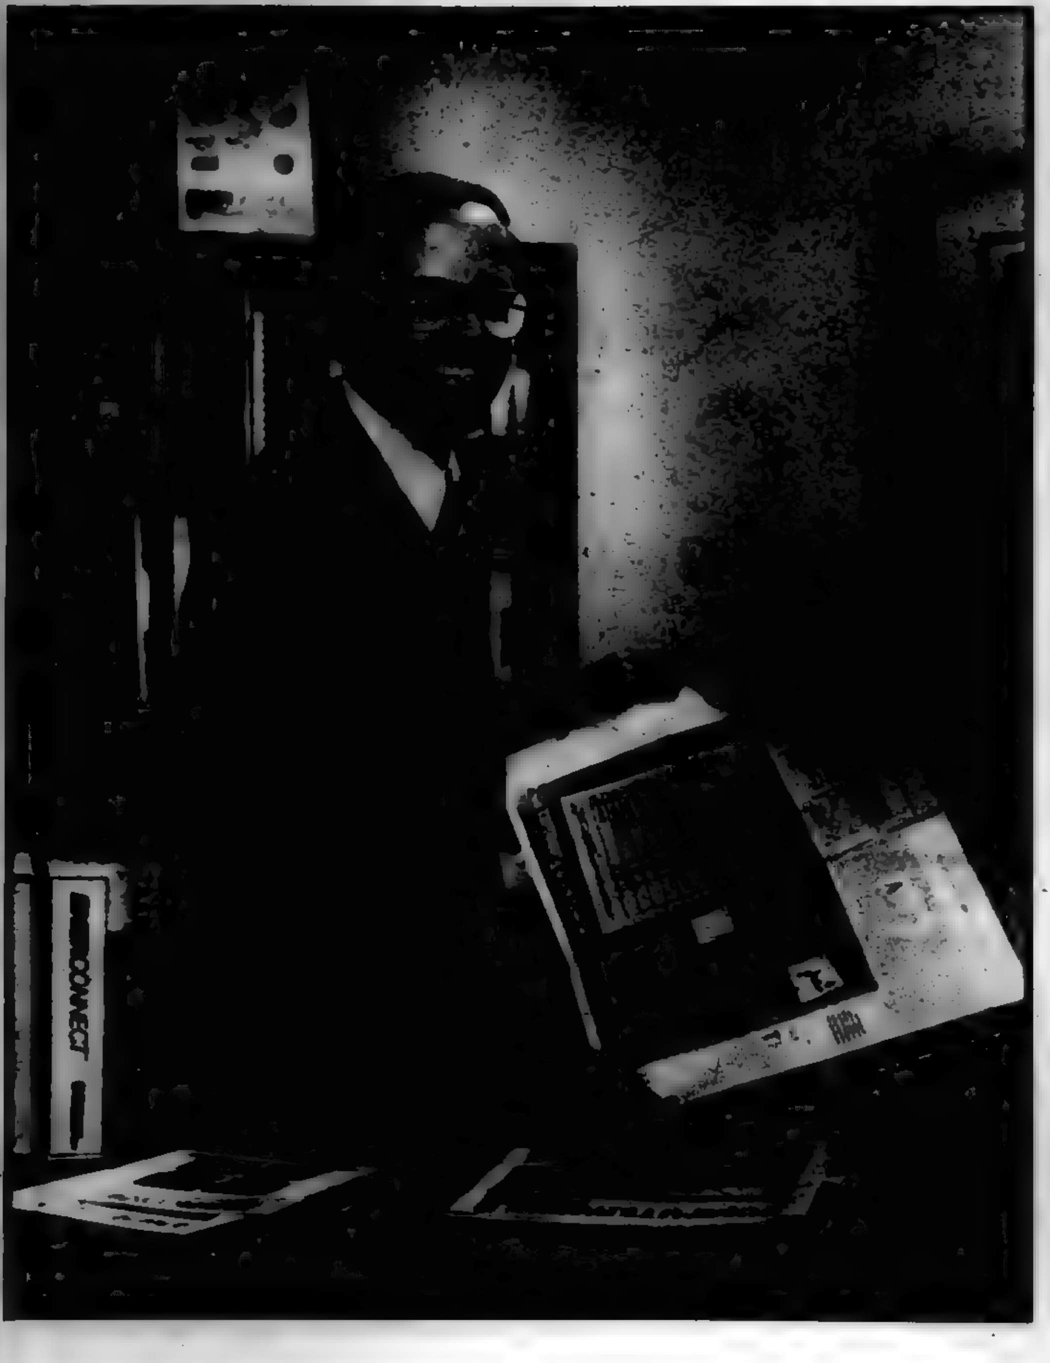
“Two ads in Computerworld Focus flooded us with inquiries on our new micro product, EnerConnect.”



EnerConnect is the second major micro product from Enertronics, developers of the successful EnerGraphics package. As the ad for EnerConnect says, it is “. . . the first software package that puts mainframe graphics capability into the hands of anyone with an IBM PC . . . or 3270 PC.”

When it came time to announce EnerConnect, Randy Andes decided to use *Information Week*, *Business Week*, and *Computerworld Focus*. As Randy puts it, “. . . we knew *Computerworld* reached the people we need to talk to from past ads for EnerGraphics, and we decided to test *Focus* because, as the name says, each issue focuses on a topic. So, we could select an appropriate editorial environment.”

The results? “*Computerworld Focus* has produced the most response of any of the publications used and, by far, the best response. In fact, total response (via the 800 number) has far exceeded expectations. We further intend to continue to tie into *Computerworld's* editorial calendar where appropriate.”

The moral? Well focused advertising in a well focused medium will produce the best results every time.

Call your *Computerworld* advertising representative for more details on upcoming issues of *Computerworld Focus*.

Randy T. Andes, Director of Marketing,
Enertronics Research, Inc., St. Louis, Missouri.

COMPUTER INDUSTRY

Amidst shakeout, firm seeks growth via buyout

MOUNTAIN VIEW, Calif. — The much-heralded shakeout in the microcomputer software industry brings with it aggressive growth opportunities for a few companies, and Software Publishing Corp. intends to be one of the big survivors.

Last month [CW, July 8], the company announced it would acquire Harvard Software, Inc. of Littleton, Mass. The move gives the publisher of the popular PFS product series its first corporate-oriented product, Harvard's best-selling project management software, Harvard Project Manager and Harvard Total Project Manager.

In a recent interview, Fred Gibbons, president of Software Publishing, said the company must address new markets if it is to reach the $100 million revenue mark he has targeted for 1987. Last year, the company's annual revenue was $23 million; in the first nine months of the current fiscal year, revenue was $26.5 million, and profits were $4.3 million.

No further acquisitions are planned, but Gibbons did not rule out future activity. "Mergers are seductive," he said. Gibbons envisions his company in the same revenue category of mainframe software vendor Cullinet Software, Inc. within three years. "And it's all available through acquisitions like this one," he added.

But his immediate priority is "to make this acquisition work first." The merger must still be approved by the boards of directors of both companies, and neither company would comment on whether the Harvard operation would be moved to the West Coast or if its management team will remain intact. The price of the acquisition was not released, but sources said it is approximately $7 million.

Both Gibbons and Harvard Software said they believe the merger provides each with access to the other's high-growth markets.

"We need Software Publishing just like

TI reports more losses, staff cuts

DALLAS — Continuing to feel the brunt of the semiconductor industry slump, Texas Instruments, Inc. recently announced a second-quarter loss and its third round of layoffs in eight months.

The company said its chip business operated at a loss during the quarter ended June 30. TI also reported that sales of data systems equipment declined from the year-earlier period. TI reported a net loss of $3.9 million, or 16 cents per share, compared with year-earlier profits of $85.9 million, or $3.57 per share. Revenue declined 16% to $1.23 billion, compared with $1.46 billion a year earlier.

In a prepared statement, Chairman Mark Shepherd Jr. and President and Chief Executive Officer Jerry R. Junkins said the company plans to lay off 1,800 workers and continue reduced work sched-

- No news is good news these days, with three vendors of communications products recently chiming in with less than glowing financial reports and Perkin-Elmer dismissing workers in a consolidation move/58
- Despite the imminence of commercially viable optical storage products, Eastman Kodak is confident that demand will increase for computer-integrated microfilm applications/59

Software mart: Mixed results

As anticipated [CW, July 15], Applied Data Research, Inc. (ADR) recently reported a second-quarter loss of $3.1 million, or 48 cents per share, its first quarterly loss in two years.

However, two other software vendors, Computer Associates International, Inc. and Computer Sciences Corp. (CSC) continued their growth, posting earnings gains for the quarter ended June 30.

ADR of Princeton, N.J., posted a slight revenue gain to $30.1 million from $28.5 million a year ago. But Chairman and Chief Executive Officer John R. Bennett said the increase did not keep pace with expenses. ADR had earned $1.7 million, or 30 cents per share, in the comparable quarter last year.

See ADR page 61

Move to smaller drive not easy

INDUSTRY INSIGHT

By Edward Warner
CW Senior Writer

In a move that holds the potential to cost users a bundle, IBM late last month announced that it has ended research and development on 5¼-in. diskette drives and plans to cease their production in its sole U.S. diskette drive manufacturing facility.

The move, according to analysts such as James Stone, vice-president for research at Shearson Lehman/American Express, Inc. in New York, is a leading indicator of Big Blue's intent to shift emphasis to the rival 3½-in. diskette format in its future personal computers, beginning with its much-rumored laptop. For the user, this all might appear to be a small matter, something akin to a decision to offer a smaller keyboard. If only that were the case.

In actuality, users of Personal Computer software may find themselves boxed in a few years down the line as they attempt to replace their older Personal Computers with newer IBM desktop machines that use the 3½-in. drives. Confronted with the difference in size between the diskettes of their existing software and the tiny mouths of 3½-in. drives, users will try to copy their programs to blank 3½-in. diskettes.

In the case of non-copy-protected programs, like Multimate International Corp.'s Multimate word processor,

See STOP page 60

Seequa Computer ailing; others to handle production

By Clinton Wilder
CW Staff

ODENTON, Md. — One of many victims of the IBM-compatible micro shakeout, Seequa Computer Corp. now hopes to survive by having its computers built by other companies 3,000 miles away.

The 8-year-old vendor has endured reportedly massive debt, the closing of its one production facility and the layoff of almost 90% of its work force.

As recently as one year ago, Seequa employed more than 250 people, many of whom assembled machines like the IBM Portable Computer-compatible Chameleon at the production facility here. Now Seequa employs just 30 marketing, sales and management employees, and its computers are built in California's Silicon Valley and Guadalajara, Mexico.

Late last month, a local auctioneer sold off Seequa's production plant assets in a two-day liquidation. According to Seequa officials, the firm felt it was more cost-effective to farm out all of its production to outside suppliers.

"We're looking for a new location for our offices in the near future," said Seequa sales support representative John Hughes. "There's a lot of unused space here."

In recent months, Seequa has signed agreements with three firms to handle its production. Sunnyvale, Calif.-based Televideo Systems, Inc., manufactures the portable Chameleon XL, Prime Circuit Technology builds the Chameleon in San Jose, Calif., and the Mexican firm of Fabremex will assemble a new Seequa product in Guadalajara.

"We made the decision to shut down here six to nine months ago," said Jim Hoffman, Seequa's marketing director. "We've been gradually phasing out production, and for the last six months we've only done final assembly here. We're keeping a few production people to oversee the subcontractors, but most of [the 30 remaining employees] are in technical, sales and marketing positions."

Televideo's relationship with Seequa is tied to a $100 million U.S. Navy computer systems contract awarded to Federal Data Corp. of Chevy Chase, Md., earlier this year. Seequa was to be a prime subcontractor for up to 1,000 Chameleons, but the firm later sold its manufacturing rights to Televideo through Federal Data and one of Seequa's creditors, the Bank of Maryland.

"Our production costs were too high to support our manufacturing facility," Seequa's Hughes said.

Officials at closely held Seequa declined to reveal financial information, but consultant Terry Miller said the company told its creditors earlier this year that it had $4 million to $4.5 million in assets and $14 million in debts. "They've been in a world of hurt," said Miller, president of Government Sales Consultants, Inc., of Annandale, Va., a firm that advises both the federal government and its computer contractors. "I think the creditors are willing to play along," Miller added.

Second-quarter losses hit leading vendors

The effect of the computer industry slowdown was reflected in the recently announced second-quarter financial results of three leading communications vendors. Intecom, Inc. and TIE/Communications, Inc. posted substantial losses, while Ungermann-Bass, Inc. reported an 11.5% decline in profits from the year-earlier quarter.

Shelton, Conn.-based TIE/Communications posted a loss of $40 million, or $1.12 per share, as second-quarter revenue of $70.2 million was less than half of the company's revenue a year ago. In the second quarter of 1984, TIE/Communications earned $507,000, or 2 cents per share, on sales of $145.1 million.

TIE/Communications blamed the losses on $40 million write-downs of the value of slow-moving inventories, $8 million in restructuring and consolidation costs and the liquidation of some inventories. The firm's President and Chairman Thomas L. Kelly Jr. said an anticipated increase in sales and a lowered bottom line are expected to make the company profitable by the fourth quarter.

Intecom also wrote down backlogged inventories in its older S/40 and TSX product lines, a $7.6 million charge that contributed to a second-quarter loss of $6.8 million, or 21 cents per share. The Allen, Texas, communications switch maker earned $1.8 million, or 6 cents per share, in the comparable quarter a year ago. Revenue declined slightly from $28.2 million to $27.9 million.

Despite a 48% increase in sales, Ungermann-Bass reported an earnings decline from $1.5 million, or 9 cents per share, a year ago to $1.3 million, or 8 cents per share. Second-quarter revenue was $18.6 million, up from $12.6 million in the same quarter in 1984.

The Santa Clara, Calif., local-area network vendor reported that second-quarter operating expenses soared 62%, from $10.9 million in 1984 to $17.7 million in 1985. Outlays for research and development climbed 80% to $3.3 million, or 18% of sales during the quarter.

PE cuts work force by 2%

NORWALK, Conn. — Perkin-Elmer Corp. recently announced it had reduced its work force by 240 people, or 2% of its 15,700 employees, and will shut down in early 1986 its Oak Brook, Ill., Instrument Department.

The company said the work force reduction would primarily affect Connecticut facilities and affected employees will receive full benefits for the 1985 fiscal year.

Horace G. McDonnell, chairman and chief executive officer, said the reduction followed a number of reorganization and restructuring steps made this year to strengthen the company's ability to respond to changing business needs.

McDonnell said the extent of the reduction was lessened somewhat by efforts to transfer employees to other divisions where their skills could be used.

DEC fuels Emulex suit

MAYNARD, Mass. — The ongoing legal battle between Digital Equipment Corp. and Emulex Corp. heated up recently with both firms making additional charges.

DEC amended its pending multimillion-dollar patent infringement lawsuit [CW, July 15] to charge that Emulex induced a former DEC employee to spill trade secrets, while Emulex threatened counteraction to protect itself from harassment.

In its original suit in federal court in Concord, N.H., July 5, DEC charged Emulex with using proprietary DEC technology in its DEC-compatible port protocol, bus and interconnect products. DEC added the trade secret theft charges against the firm July 22 and filed a separate trade secret theft lawsuit against former DEC senior engineer Charles Hess in federal court in Denver on July 19. Separately, DEC sought and was granted an injunction in New Hampshire on July 18 preventing Hess from participating "in any matter relating to the lawsuit."

DEC based its request on a charge that Hess, while employed by DEC in Colorado Springs, Colo., participated in a confidential meeting with attorneys discussing legal action against Emulex. DEC alleged that Hess was secretly discussing employment with Emulex at the time and "related information he learned at this meeting to Emulex." Emulex later hired Hess as director of engineering.

Emulex attorneys have 20 days to file a formal response to the July 18 injunction, but Emulex Chairman Fred B. Cox immediately issued a statement. "We believe that the primary purpose of DEC's inflammatory allegations is to strengthen its position by trying to discredit Emulex in the press," Cox said. "[The charges] that we willfully induced an employee to steal trade secrets and violate terms of an employment contract are absolutely false."

Study belies 'two-tier work force'

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — A study said to dispute the theory that office and factory automation creates a "two-tier work force" of a small number of high-paid executives and a large number of low-paid menial workers was released recently by a computer trade association.

The Computer and Business Equipment Manufacturers Association (Cbema) said the study was commissioned to respond to critics who say that computers and robots have displaced many middle-income jobs, particularly in high-technology industries.

Statements such as these have been made by the AFL-CIO and MIT Professors Harley Shaiken and Lester Thurow.

At a press conference here, Cbema released a report by James L. Medoff, a Harvard University economist, and Paul A. Strassmann, a former MIS executive at Xerox Corp.

Medoff said his study of hourly earnings by U.S. nonagricultural workers showed that "during the past decade inequality in hourly earnings among all wage earners in this country has remained remarkably constant." This finding, Strassmann said, contradicts the two-tier work force theory.

In a previous Cbema-sponsored study done by Strassmann, he said that the computer industry "is the most middle-class industry I have found."

Cbema President Vico E. Henriques said the trade association "is pleased to help demonstrate that the fears some people have about the negative effect of computers are inconsistent with the data."

Zenith names new president

GLENVIEW, Ill. — Zenith Electronics Corp. recently announced the promotion of Robert P. Dilworth to the position of president of Zenith Data Systems Corp.

Dilworth succeeds interim President Carl A. Michelotti, who remains corporate senior vice-president and group executive with the parent company, Zenith Electronics.

Michelotti, who announced Dilworth's appointment, had served as interim president of Zenith Data Systems since May 1984.

Inteq subsidiary

Michelotti recently assumed responsibility for Zenith's recently acquired Inteq subsidiary.

Dilworth is the former president of Morrow Designs, Inc., a privately held microcomputer vendor.

Before coming to Zenith Data Systems, Dilworth was president of Ultra Magnetics and held senior positions with Varian Associates and Sperry Corp.

Exec sees growing demand for microfilm

By Peter Bartolik
CW Staff

Despite the increasing development pace of optical disk storage technology, Eastman Kodak Co. is confident that demand for computer-integrated microfilm applications will continue to grow.

During a recent interview with *Computerworld*, John A. Lacy, general manager for marketing and vice-president of Kodak's Business Imaging Systems Division, said he sees little likelihood that technological developments in magnetic and optical storage will override the cost and duplication advantages of microfilm.

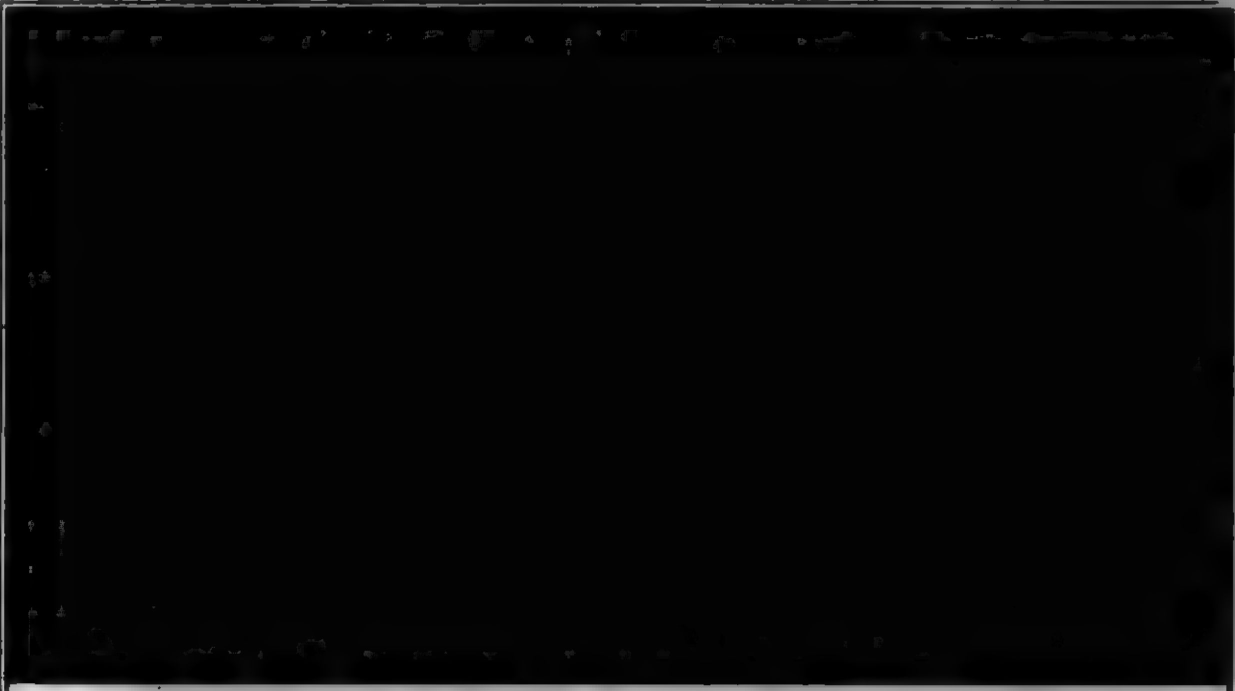
"There is a tendency for people to feel that higher capacity magnetics or optical storage is going to replace film, but we don't believe it for a second," Lacy said. During last month's National Computer Conference, Kodak's recently acquired subsidiary, Verbatim Corp., demonstrated a prototype read-write optical disk drive system using a 3½-in. format.

In recent months, Business Imaging Systems announced a number of computer-assisted microfilm retrieval and computer output microfilm imaging systems. Also, the Kodak Copy Products Division unveiled an electronic publishing system.

Lacy predicted that interest in optical storage developments will spur interest in alternative document storage technologies. He said the situation may be analogous to the introduction of magnetic disk technology, which at one time was incorrectly predicted to signal the demise of magnetic tape demand.

"We are well aware of the disadvantages of microfilm," Lacy said, noting a slower access time for retrieving microfilm. But he noted that technological developments such as the company's autoloading retrieval device has greatly improved access time. "Microfilm still is the least expensive storage medium," he said.

Kodak's strategy is to develop systems capable of using all storage alternatives and allowing customers to make their own selections, according to Lacy.



It's more than just a name.

Introducing Sperry CUSTOMCARE™ service. It combines the right people with the right technology to give you fast, personal service.

Sperry has always believed that providing first class customer support is as important as providing first class equipment. And as a result, we have one of the most professional, most sophisticated service organizations in the world.

Now, to further express our dedication to customer service, we are bringing together the total resources of our nationwide services under one name: CUSTOMCARE.

CUSTOMCARE service is more than just a name. It's a total commitment to personalized service on the part of the more than 5000 support personnel who make up the Sperry CUSTOMCARE service team.

They care about your business. They'll take the time to select a service plan that's right for you; a plan that can combine a wide variety of support programs including:

Innovative customer education programs that include both videotaped instruction and specialized seminars at nationwide Sperry Learning Centers…

On site applications, network design and performance analysis expertise; plus readily available centralized technical software assistance…

And a choice of flexible on-site and off-site hardware maintenance options. Plus the new third party services that let you apply the benefits of CUSTOMCARE service to non-Sperry equipment.

Together, we'll find the total service plan that gives you maximum efficiency from your computer and information processing equipment, and maximum value for your service dollar.

With CUSTOMCARE service, you're never standing alone. You're supported by an experienced, dedicated service organization that has been getting the job done for over three decades.

STOP from page 57

that should be no problem. A Multimate spokesman said that the firm does not view such duplication as a license violation.

In the case of such software as Lotus Development Corp.'s 1-2-3 and Symphony, however, the user is in for a surprise. Both programs are copy protected and are already available in versions for the 3½-in. format.

Though there is a trend toward nonprotected software, Lotus has yet to join it, and, if it and other software vendors do not, users will find themselves compelled to buy 3½-in. versions of programs that they already own just so that they can run those programs on new Personal Computers.

Impact on 1-2-3 users

As an illustration, analyst Stone noted the impact this might have on those who want to use 1-2-3 on an IBM laptop, a machine being referred to by some as the Clamshell. As Stone put it, "my price just went up $600 in the Clamshell to buy it in 3½-in. [drives]."

The potential cost to corporate users, who could own hundreds of copies of a copy-protected program like 1-2-3, might be outrageous.

This is not IBM's fault; the Giant of Armonk, though much enamored of standards, has every right to move to adopt a format that uses media that is more ruggedly packaged and has the capacity to hold more data than the floppy diskette. The Personal Computer that IBM sells in Japan, in fact, uses 3½-in. drives — each holding 1M byte of data.

The software vendor, it could also be argued, has every right to make another buck or two by selling the same program twice to users, once for the Personal Computer and again for the Personal Computer's 3½-in. diskette successor.

Additional software costs

That argument is not likely to sit well with those who are facing several thousands of dollars in additional software costs when their corporations want to upgrade their existing stock of Personal Computers.

This may be a nightmare scenario for the corporate personal computer manager, but it is not one they will likely face in the coming year unless they buy a quantity of Clamshell laptop units, should that machine debut soon.

In the view of analyst Jim Porter, president of Disk/Trend, Inc., IBM will use 1M-byte, 3½-in. diskette drives in the Clamshell, if it uses them at all next year — provided, that is, that the Clamshell is introduced.

By 1987, though, users might begin to see 2M-byte 3½-in. diskette drives in use in IBM desktop machines — and at that point, a new standard will be set. When that happens, Personal Computer software in the 5¼-in. format might become as scarce as software in the rival format is today. As Porter rhetorically asked, "You have trouble buying 78 rpm records today, don't you?"

TI from page 57

ules, primarily in semiconductor operations. "It is clear that the world semiconductor industry is in its deepest recession since 1974 and possibly the most severe in the history of the industry," the executives said.

Last December, TI dismissed 2,000 workers, and an additional 1,000 workers were dismissed in April.

The TI executives warned that conditions are not likely to improve soon. "The declining shipment trend is expected to continue, with further adverse effect on the financial performance of this business in the third quarter," the statement said.

Following the operating losses posted by Intel Corp. and Advanced Micro Devices, Inc. [CW, July 29], TI's deteriorating semiconductor operations indicate that the prolonged semiconductor slump is far from over.

from page 57

they need us," said Shakeel Mozaffar, vice-president of marketing at Harvard Software.

Future Computing, Inc., a market research firm in Richardson, Texas, is predicting that the market for project management software will grow from $50 million in 1985 to $265 million by 1990. However, most of this growth will occur in sales to smaller companies, while the bulk of Harvard Software's present business comes from Fortune 1,000 customers, Mozaffar said.

According to Mozaffar, with its current product line, Harvard Software expects to post sales of $6 million for the year, up from $3.3 million in 1984.

According to Gibbons, "the Harvard product line will serve as a path to more sophisticated business applications for Software Publishing. This is the direction we want to target, because the capabilities of personal computers are increasing, and we need to match this with more software capability and power."

More memory and windowing capabilities are the most important new developments affecting his products, Gibbons said.

Software Publishing's PFS product line has an installed base of 1.6 million units, Gibbons said. During the third quarter just ended, revenue was $7.9 million, up from $5.9 million a year ago. The company posted a third-quarter profit of $892,000, down from $1.06 million a year earlier.

"Both partners will gain from the merger," said Paul Cubbage, an analyst with Dataquest, Inc., a market research firm in San Jose, Calif. The merger will give Software Publishing access to Harvard Software's installed base in the corporate environment, while Harvard Software will gain financial clout and marketing expertise, Cubbage said.

But the marriage may not be completely smooth, according to one analyst. "It will be difficult for Software Publishing to create more complex programs, yet still maintain the ease-of-use reputation which is the company's hallmark," said Richard Matlack, a vice-president at Infocorp, a market research firm in Cupertino, Calif.

Software Publishing will face a horde of competitors when it targets complex applications for the corporate user, according to Matlack, who said there are more than 100 vendors producing project management packages for personal computers.

Gibbons said the company will remain basically unchanged. "We'll keep our products simple. We won't become suddenly feature crazy, adding lots of bells and whistles to our new products," he said. Since both companies sell through retail channels, the merged company will have an advantage over Harvard Software's competitors, most of which market products through OEMs, he said.

ADR

from page 57

"We have always made significant investments in maintaining, enhancing and developing new software products," Bennett said. "While we will moderate our expenses in response to what we think is a cyclical slowdown in the computer industry, we will continue our commitment to building ADR's future. Bennett predicted a $2.1 per-share profit for ADR for the full year.

Jericho, N.Y.-based Computer Associates reported earnings increased 36% to $1.4 million, or 13 cents per share, up from $1 million, or 9 cents per share, in the second quarter of 1984. Sales grew 42%, from $22 million to $31.2 million. The results represented the firm's 15th consecutive quarter of 30% or higher growth in both sales and earnings since going public in December 1981.

"All of our operations performed essentially according to plan," said Computer Associates President Anthony W. Wang. The company also announced that the name of its recently acquired Sorcim/IUS Micro Software division has been changed to Computer Associates Micro Products Division.

CSC of El Segundo, Calif., reported more modest earnings growth of 12%, from $4.6 million, or 34 cents per share a year ago, to $5.2 million, or 38 cents per share, in the quarter ended June 30. Revenue increased 8% to $187.5 million, up from $173.9 million in the comparable 1984 quarter.

Two-for-one special.

Tired of the perplexing decision about which desk-top computer to buy?

We don't blame you. Many people are familiar with the sophistication, power and advanced technology of the Macintosh. Others admire the IBM PC and its library of almost 10,000 software programs.

So which computer should you buy?

Well, now MacCharlie from Dayna Communications gives you an easy answer. Because with MacCharlie, your Macintosh becomes compatible with IBM PC software—and you benefit from the best of both worlds.

MacCharlie actually enhances IBM PC software. Your Macintosh menu bar and window sizing are still active with the mouse. So now you have use of options like the clipboard, calculator and notepad with IBM PC software.

And through MacCharlie, you can link Macintosh to IBM serial networks and mainframes. Data files are also transferable from Macintosh to IBM and vice versa. Even if you have already taken the plunge into the IBM PC world, you now have the means to advance to Macintosh and still keep your software library intact.

So have your Macintosh and IBM PC software too, with MacCharlie, and enjoy the best of both worlds.

POSITION ANNOUNCEMENTS

Information Processing Professionals

Overcome the obstacles in your career

Now is the time to move ahead and win the recognition you seek. Electronic Data Systems (EDS) Corporation can help you overcome your career hurdles through our dynamic growth and our dominance in the information processing industry. We employ more than 35,000 people, generated over $947 million in annual revenues in 1984, and have an amazing growth rate of 25% per year. Our network of more than 50,000 on-line terminals, the third largest of its kind in the country, processes over six million transactions daily.

The rewards of joining the EDS team are many. But most important to you is opportunity — the opportunity we want to share with those who can help us meet tomorrow's challenges today.

Our recent alliance with General Motors has signaled the beginning of a new era for EDS, which includes worldwide expansion of our markets. As an independent GM subsidiary, we are continuing to serve our existing national and international customers in banking, government and military services, health care, insurance, manufacturing and utilities.

Throughout our company, EDS encourages creativity, skills enhancement and advancement based on performance rather than seniority. If this sounds like the atmosphere you have been looking for, consider the career options with EDS. Currently positions are available for experienced professionals with 3 or more years experience in the following areas:

- **Mainframe Applications Programmers**
- **IMS/IDMS Specialists**
- **CAD/CAM Specialists**
- **Network Specialists**
- **EDP Auditors**

D.P. PROFESSIONALS

UP TO $68,800 P.A.* TAX FREE PLUS BENEFITS

ESTIMATED EQUIVALENT VALUE IN U.S. EARNINGS UP TO $100,000 P.A.

Saudia's headquarters is located in Jeddah, Saudi Arabia, on the Red Sea. It has a large on-line data network growing towards 3,000 terminals in 70 cities worldwide. It is an operation which offers the challenge of state-of-the-art technology to support its dynamic growth and expansion plans which are based on large-scale IBM mainframes using MVS/XA, ACP/TPF and JES 3.

A GENEROUS BENEFITS PACKAGE

In addition to your tax-free salary, you can also expect:

- Automatic annual increase
- Annual performance and merit bonus
- Completion-of-contract bonus
- Free furnished housing
- Free and reduced rate air travel
- Kindergarten to 9th grade school provided — financial assistance to other grades
- Paid medical and life insurance
- 30 days annual leave
- 9 annual paid holidays
- Household shipment from domicile and back

To help us with our next stage of growth, we are looking for additional high-caliber professionals to work on a 2-year renewable contract basis in the following areas:

MANAGERS — $44,900 to $68,800 P.A.*

Senior Managers with a degree and 10 years related experience are required for:

- **ACP Marketing Systems** — including reservations, departure control and fares ticketing systems
- **Computer Operations** — with proven experience in an on-line realtime MVS/CICS/IMS/TOTAL/ACP environment

PROJECT MANAGERS — $40,800 to $60,400 P.A.*
SYSTEMS ANALYSTS — $37,200 to $54,900 P.A.*

Professionals with 5 to 6 years experience in a large-scale on-line IBM environment (preferably with a degree) to develop:

- ACP Marketing Systems
- Financial Analysis Systems
- Information Center
- Flight Operations Systems
- Administrative Control Systems
- Training Specialists
- Technical Services Systems
- Data Base Administration

SOFTWARE SYSTEMS PROGRAMMERS
$34,000 to $52,900 P.A.*

At least 4 years of generation and maintenance experience in one of the following operating systems:

- VM
- ACP/TPF
- MVS/SP
- IMS
- TOTAL
- CICS
- VTAM/NCP

COMPUTER OPERATIONS STAFF
$32,500 to $46,900 P.A.*

Senior console operators with extensive experience in a multi-CPU environment and large on-line terminal network are needed to support operations of ACP, MVS and VM operating systems.

In addition to the earnings and benefits package, Saudia provides excellent accommodations in their own private community, Saudia City, which contains: a shopping center, auto services station, central park, swimming pools, tennis courts, recreation centers and sports center. Other recreational activities such as snorkeling, scuba diving, wind surfing and camping are also within easy reach at the Red Sea.

***The salaries quoted are based on the current rate of exchange, Saudi Riyals 3.62 = $1 U.S. Dollar, and are subject to change with rate fluctuation, and are dependent on qualifications and experience. They include base salary, standard allowances and a factor for overtime usually worked.**

You've got the experience. We've got the opportunity. Let's talk.

We're looking for someone who talks our language. ADABAS. NATURAL. COM-PLETE. These are the kinds of forward-looking products that have made Software AG the leading supplier of advanced information system development software.

But we didn't get where we are by resting on our laurels. We need experienced mainframe software professionals to continue our reputation for anticipating industry software needs and meeting them with innovative solutions.

Like ADABAS. One of the first relational database management systems. Proven by over a decade of use.

Or NATURAL. The world's most widely used, fourth generation programming language.

And COM-PLETE. Our on-line teleprocessing system that monitors on-line transactions in a multi-user environment.

Do you have three or more years' experience with mainframe software and IBM operating systems? Are you ready for a fast-growth company where you'll play a key part in an innovative development team? Can you handle an attractive salary, lots of room to put your ideas to work, and growth potential limited only by your ability and your imagination? Then we want to talk to you.

An Affirmative Action Employer.

UCLA

Taking the Long-Range View

You probably have many years of EDP employment before you. One of the most important questions you can ask yourself now is, "Do I want to spend all the rest of my working years living in this area?" Think about it. Many of us have secret yearnings to live in a favored part of our country. Yet, most of us are deterred by all the problems involved in relocation. Still, if you were to devote a few days or even weeks to solving those problems... you could spend all the rest of your life where you really want to be. Certainly, you'll agree, that such a desireable achievement is well worth the effort required.

NCA cannot, of course, solve all the problems of relocating... but we can help you with the biggest one... EDP employment. Through our national network of firms we can find you an ideal EDP position... and before you move. Also, you'll be glad to know, many of our company clients will pay both interview and relocation expenses.

Your first move is to NCA. Come in. Call. Or mail your resume to the NCA firm nearest to you. Confidentiality is assured. There is no charge to you whatever for any of our excellent services because company clients assume our fees.

SYSTEMS REVIEW ANALYSTS

DATA SYSTEMS DEVELOPMENT REVIEW

The Chase Manhattan Bank, one of the world's premier financial institutions, is significantly expanding the use of data processing on a world-wide basis. Our Data Systems Development Review function has a significant responsibility in this area in the USA and extending to fifty locations around the globe. We offer a wealth of unique opportunities to high calibre data processing professionals as systems review analysts.

We are currently seeking individuals with the following qualifications:

- **Three to five years data processing experience with an emphasis on the analysis and design of relatively complex systems. Experience in data processing management and/or project leadership would be very beneficial.**
- **Bachelors degree. MBA or MS highly desirable.**
- **Knowledge of state-of-the-art computer concepts and technology including data communications, data base and systems software.**
- **Appreciation of security, control and auditability in advanced systems.**
- **Excellent written and oral communication skills, as well as the ability to deal with senior management.**

We offer an excellent salary commensurate with experience, along with liberal benefits, including tuition reimbursement. Qualified and interested individuals are urged to send resumes, including salary history and requirements, in complete confidence to: **Kathleen Kirrane, Second Vice President, General Auditing, Human Resources, Chase Manhattan Bank, One New York Plaza, 16th floor, New York, N.Y. 10081. An Equal Opportunity Employer F/M/H**

(ONLY resumes with salary history will be considered. No phone calls or agency inquiries, please.)

CHASE

DIRECTOR OF COMPUTING RESOURCE DEVELOPMENT

The Board of Regents invites applications and nominations for the position of Director of Computing Resource Development. The Massachusetts Board of Regents of Higher Education, located in Boston, is a state-wide governing board with oversight responsibility for twenty-nine public college and university campuses, including budget allocation, academic program review, research and planning, affirmative action, collective bargaining, a [illegible] scholarship program, and major policy development for higher education.

Applicants for the Director's position must have a Master's degree in Computer Science or related field and five to ten years of relevant programming, communications, and systems development experience. A sound knowledge of [illegible] technology and strong managerial and communication skills required. Familiarity and experience with Cyber and/or IBM mainframes, minicomputers and local area networks is desirable.

Major responsibilities include assistance in the development of long range plans for system-wide computing and responsibility for working with campuses and other state agencies on various joint hardware and software acquisition plans. The Director will serve as the primary liaison for technical assistance to campuses on systems' issues and problems. Salary range from $[illegible] - $47,[illegible].

Applications and nominations, including current resume and list of references, should be received no later than August 30, 1985. Minorities and women are encouraged to apply.

SAUDI ARABIA DP CAREER OPPORTUNITIES

The Computer Department at the Ministry of Planning is seeking highly motivated individuals to play a major role in the definition, design, programming and implementation of business, planning and socio-economic systems.

The Ministry of Planning of the Kingdom of Saudi Arabia is responsible for the preparation of the national 5-year development plans and the monitoring of their implementations.

The mandate of the Computer Department in the Ministry of Planning is to provide computer support to its different departments by developing necessary models and systems, and maintaining existing ones.

These systems are being developed on an IBM 4341 VSAM/TSO/ISPF using mainly ADABAS/NATURAL but also COBOL, FORTRAN and SAS.

A number of immediate opportunities are available for DP professionals in the following areas:

OFFICE AUTOMATION MANAGER

MS required in Computer Engineering or Computer Science or equivalent. At least 8 years experience in Data Processing out of which at least 4 years must be in managing and implementing office automation technology. Must have the experience of using the microcomputer software (DBASE II, WP, Spread-sheet etc.). Ideal candidate will also be familiar with the Arabic language business systems and development software. Interpersonal skills and ability to train users.

SYSTEMS ANALYSTS

BS/BA required as a minimum. Must have at least six years experience in DP and a proven track in the following areas: Requirement analysis, project responsibilities from inception through completion, excellent written and verbal communication skills, familiarity with conventional languages, hands-on experience in ISPF, knowledge of data base concepts, experience in using systems development methodologies and in preparing documentation for all phases of the systems development life cycle, experience in statistical modeling is a plus.

PROGRAMMER/ANALYSTS

BS/BA required in CS or related discipline, must have at least four years experience analyzing, designing, programming, testing and maintaining business application systems on IBM mainframe, good knowledge of COBOL and/or PL/1 essential, familiarity with FORTRAN and NATURAL is a plus, good communication skills. Familiar with systems development methodologies and documentation of application systems.

COMPUTER PROGRAMMERS

BS/BA or equivalent diploma required. Must have at least three years experience in preparing program design and specifications, programming and testing business application systems on IBM mainframe, experience in using different access methods including VSAM and data base management systems, good communication skills.

TRAINING INSTRUCTOR

BS/BA required in CS or related discipline. Must have at least five years experience in DP two of which in computer teaching and preparing training materials, excellent written and verbal communications skills.

For all positions, bilingual applicants (Arabic, English) are preferred. All positions are offered on a 2-year contract basis. Excellent benefits package includes free medical care, housing and furniture allowances, education allowances for children, transportation and maintenance allowance, 45-day annual leave and a yearly round-trip ticket to the location of the present residency.

Applicants should immediately send resume including telephone numbers, references, recent passport-size picture, salary history and desired position to:

Computer Department, Ministry of Planning
P.O. Box 358
Riyadh 11411, Kingdom of Saudi Arabia

Telephone: (966) 01-401-[illegible]
Telex: 2[illegible] PLAN SJ

Last date for submission of applications is September 4, 1985.

Computer Professionals

Reynolds Aluminum has multiple openings for Computer Professionals, at its Richmond, Virginia corporate headquarters. The environment consists of multiple large systems utilizing MVS/XA, JES2, TSO/ISPF, ACF/VTAM, CICS, DB2, CMF and IMS/DB. Also interested in System/38 applicants with experience in CL language, RPG III and screen design aid to support manufacturing and technical applications. Successful applicants will possess a college degree or compensating experience, and enjoy working with a team of highly skilled and motivated professionals in an atmosphere of challenge and growth provided by a Fortune 125 company.

Positions are open in the following disciplines:

- APPLICATION SYSTEMS ANALYSTS
- APPLICATION PROGRAMMERS
- CICS SYSTEMS PROGRAMMERS
- MVS/XA SYSTEMS PROGRAMMERS

Applicants in the above disciplines require a minimum of 2 years experience in the applied area of interest. Analytical and leadership skills are desired.

Competitive salary commensurate with experience includes outstanding fringe benefit package. Our Richmond location offers excellent educational, cultural and recreational opportunities. Please send resume in confidence, outlining work and salary history (no third party inquiries, please) to: P.A. Bowman, Personnel Manager, Information Systems, Reynolds Metals Company, P.O. Box 27003, Richmond, VA 23261. Equal opportunity employer.

PhD's SABBATICAL OPPORTUNITY

(Take Leave To Take Charge With Hughes)

Hughes Corporate Communications & Data Processing has an exemplary opportunity for a motivated Educator who can take on a 1-2 year assignment evaluating and selecting Data Processing tools.

This position provides the chance to determine the latest technology, assess needs, select optimum productivity, and project management tools, and initiate them in the organization.

The individual we seek will be a PhD presently teaching at the University level, able and interested in taking a sabbatical or leave of absence of 1-2 years for this challenging and highly visible position. Solid expertise in structural methods and programming is essential, with proven leadership abilities. Effective evaluation and administrative skills are also prerequisites.

This unique position affords the opportunity to be a direction-setter in an exciting environment of industry innovation and excellence. The compensation package, on a 12-month basis, is substantial, befitting the demands of the position.

If you possess the qualities we seek, we'd be most interested in hearing from you. Please send resume/responses to: Dr. Thomas H. Athey, Assistant Director System Planning, Hughes Aircraft Company, Corporate Communications & Data Processing, P.O. Box 9399, Bldg. C5, M/S 2009, Long Beach, CA 90810-0465. INTERNAL TRAINING/ MARKETING

DATA PROCESSING

OPPORTUNITY IN STATE-OF-THE-ART INFORMATION MANAGEMENT

Hughes Corporate Communications and Data Processing is advancing information management technology. Our challenging and growing involvement with sophisticated computer systems has created an excellent position for a professional with a broad base of marketing and training expertise.

Based at our major data processing center, you will work closely with senior management personnel analyzing/evaluating vendor systems and requirements for internal training programs. Your ability to package specific solutions, effective marketing solutions, and work independently is essential.

Your background should include a Bachelor's degree and significant knowledge of up-to-the-minute data processing technology. Our preferred candidate will have at least 10 years experience in training or consulting in data processing or similar technical/business area. Effective interpersonal skills are important.

In return for your qualifications, Hughes offers a competitive salary and an outstanding benefits package that includes medical, dental, and vision-care coverage for you and your eligible dependents. We also provide our employees with a tax-deferred savings plan.

Please send your resume to: Dr. Thomas H. Athey, Assistant Director System Planning, Hughes Aircraft Company, Corporate Communications & Data Processing, P.O. Box 9399, Bldg. C5, M/S 2009, Long Beach, CA 90810-0465. U.S. Citizenship Required. Equal Opportunity Employer

CORPORATE COMMUNICATIONS & DATA PROCESSING

Programmer/ Analyst

Animal Health Research

As a worldwide leader in the pharmaceutical, health care and special chemicals industries, Pfizer is committed to keep pace with advancing systems technology. This means your role is of high corporate importance in our totally information-dependent field.

Right now, our Animal Health Research facility in Terre Haute, Indiana has an excellent career opportunity due to expanding research efforts. Interfacing with the Discovery and Development project teams, you will assist in the design, development, and improvement of information management systems and the planning, coding and testing of these systems. You will evaluate and recommend equipment and software requirements and modify existing software to implement approved specification changes. Position reports to the Project Analyst, Animal Health Research.

You must have a BS (MS preferred) in Computer Science with 2 years of experience programming in third and fourth-generation languages and in commercial database management systems support. VAX experience and knowledge of SAS and System 1032 or equivalent is desirable. Knowledge of FORTRAN is a plus. Acquaintance with systems analysis and design techniques and software for processing biological research is also desirable.

Pfizer offers exceptional opportunity for professional recognition and career growth with competitive compensation and excellent benefits package. Our modern facility is located in Terre Haute, home to three institutes of higher learning and offering many recreational and cultural activities. Housing and cost of living are reasonable. Indianapolis and Bloomington are nearby, and Chicago and St. Louis are only a few hours away. If interested, send your current resume to: Daniel L. Stahl, Senior Personnel Supervisor, PFIZER INC., P.O. Box 88, Terre Haute, IN 47808.

THE SCHUMANN CONSULTING GROUP

We are a well respected consulting group with about 300 employees. For the past 13 years, we have been providing a wide variety of services in the fields of management, organization and data processing on behalf of important clients in West-Germany, Italy, Spain and abroad. Within the field of EDP, especially system consultancy, we are among the leading companies in Europe. We are now considerably expanding our Systems Consulting Section and are therefore looking for several new members of staff.

WE REQUIRE:

SYSTEM SPECIALISTS

to handle interesting and demanding system-related assignments using IBM equipment.

You should have the following qualifications:

- detailed knowledge and several years of experience in one of the following fields:
  - Networks, especially SNA and VTAM
  - MVS system programming and tuning
  - DOS/VSE system programming and tuning
  - Migration: DOS to MVS
  - Data communications, especially CICS
  - Capacity planning
- sound theoretical training with an academic degree or equivalent in mathematics, computer science or engineering
- wide experience in system programming and generation
- practical experience in installation and management of DB/DC systems
- good knowledge of English and at least basic German

WE REQUIRE:

SENIOR PROGRAMMERS

with several years of experience in IMS-DB/DC, PL/1 or COBOL for application development. We expect good knowledge of the German language.

Successful candidates will not only have the necessary professional experience, but also the ability to apply their particular experience as skilled consultants. They will also need flexibility, willingness to expand their professional knowledge, as well as the drive and ability to work as team members.

We are offering attractive salaries and results-oriented bonuses. Please write, quoting the above reference, and enclosing all relevant credentials. For further information contact Mr. Tuschter. Tel.: Cologne: 0221/48 90 90

All applications will be treated confidentially.

ALASKA ALASKA ALASKA

If a 5,000 mile communications network linking 13 major sites with 8 computer systems sounds challenging the University of Alaska Computer Network would like to hear from you. We have openings for programmers and analyst/programmers to do administrative applications development and enhancements on an IBM 4381-2 running MVS/SP, ISPF, and PanValet. Our data base is Cullinet's IDMS/R release 10.0 and support software consisting of ADS On-Line, Automatic System Facility, On-Line Query, and Culprit. Programmer and user workstations are IBM PC's running micro-to-mainframe interactive communications and advanced Decision Support Systems software. We are looking for experienced people who have the demonstrated ability to be productive quickly in this environment in support of the installation and substantial enhancement of Information Associates' Student Information System and Human Resource System, and in migrating existing financial systems to the IBM 4381 mainframe. If the challenges of working on the frontiers of business application technology are what you seek, address a letter of application describing your accomplishments in data base or on-line applications, your resume and three references to us.

MINIMUM QUALIFICATIONS

Candidates for both the Programmer and Analyst/Programmer positions must have a demonstrated proficiency with IBM 4381 or equivalent mainframe running OS; OS JCL; IBM system utilities; programming on-line applications and COBOL.

PROGRAMMER (annual salary $32,448 to $37,858):

General knowledge of systems analysis and a strong working knowledge of programming; ability to independently test and debug programs and prepare documentation; to translate detailed logic flow descriptions into coded computer program instructions; to modify existing programs to accommodate changes in system requirements for equipment configurations; to design detailed record and form layouts; to prepare comprehensive computer functional descriptions; and to communicate well verbally and in writing.

ANALYST/PROGRAMMER (annual salary $37,316 to $43,492):

Knowledge of applications analysis and programming methods to utilize languages, hardware and tools in developing, coding and implementing applications; ability to work with client personnel to determine solutions and type of data to be processed; to analyze solutions in terms of operating system requirements and modify design to get maximum advantage of existing equipment; to establish efficient and effective procedures in support of automated systems; to work under limited supervision; to write, test and maintain computer programs; to devise data verification methods and standard system operational procedures; to prepare problem definitions and recommendations of equipment needed; to prepare detailed logic flows and machine instructions; and to communicate verbally and in writing.

Send application material to:

Statewide Office of Human Resource Development
University of Alaska
Room 1, Bunnell Building
Fairbanks, Alaska 99701

UNIVERSITY of ALASKA COMPUTER NETWORK

Closing date: August 16, 1985

Systems Engineers/Data Communications Engineers

THE OPPORTUNITY TO BUILD THE FACTORY OF THE FUTURE BEGINS TODAY

The alliance of Electronic Data Systems (EDS) and General Motors has combined information processing, engineering and manufacturing expertise to make the factory of the future a reality. Today, this team is conceptualizing and designing factory automation projects that are among the most advanced the world has known. Our total commitment to computer integrated manufacturing systems has created tremendous ground-floor opportunities. We are looking for "hands-on" professionals with manufacturing or systems engineering background — individuals interested in keeping abreast of today's leading technologies.

Currently, we have immediate openings at our new facility in an attractive Southeastern Michigan suburb for the following individuals:

SENIOR SYSTEMS ENGINEERS

- 5+ years experience in systems integration
- Application experience with plant scheduling, material handling, flexible machining systems, part fabrication, or automated assembly systems
- Ability to conceptualize and synthesize functional solutions based upon proven state-of-the-art technologies

DATA COMMUNICATIONS ENGINEERS

- 5+ years experience in local area and wide area network data communications
- Working knowledge with SNA, MAP, DECNET, and programmable device communications such as data highway and modbus
- Ability to architect communication local area networks using computers (DEC, IBM, HP, etc.) and devices (GMF-CM robots, AB — Modicon programmable controllers, etc.)

In addition to the technical challenges, you will find the suburban area of Southeastern Michigan to be a country/contemporary lifestyle that warms the senses. From the vastness of the Great Lakes, with the beauty of Canada as your next door neighbor, to the wildflowers of Cranbrook. You'll have the Bluegrass Festival, the excitement of Tiger Stadium and some of the best fishing anywhere.

EDS has one of the most supportive relocation programs available. We also offer a unique benefits package to complement our competitive salaries, such as employee discount programs, a health and fitness program, in-house leisure/travel department, discount stock purchase plan, credit union/savings/loans/free checking and company paid retirement programs, just to name a few.

Let EDS give you the opportunity to revolutionize manufacturing by building the Factory of the Future today. A limited number of positions are also available at our Indianapolis facility. Forward your resume in confidence to:

Electronic Data Systems Corporation

An Equal Opportunity/Affirmative Action Employer

PROGRAMMER IBM VM/CMS

The Computing Services Office of the University of Illinois has a Research Programmer position available (full or part time) in the support group for our IBM VM/CMS systems.

The group is responsible for installing and maintaining an expanding base of VM systems, evaluating application packages as needed, configuring hardware and communications gear, developing procedures for operations and, for those systems for which CSO serves as facilities manager, interfacing with the campus units owning and using those systems.

Depending on qualifications and experience, the successful applicant can be given responsibilities across all systems in specific areas of expertise or be responsible for all aspects of a specific system.

Applicants for this position should have experience with an IBM operating system, preferably VM/CMS, must be able to communicate effectively, and must have the ability to deal with large systems. Previous experience as a systems programmer is a strong plus.

The starting date is flexible and the salary range is from [illegible] to [illegible]. In order to ensure full consideration, applications must be received by September 3, 1985. Send applications to Robert [illegible], University of Illinois, 173 Digital Computer Lab, 1304 W. Springfield, Urbana, IL 61801. Phone (217) 333-[illegible].

The University of Illinois is an Affirmative Action/Equal Opportunity Employer.

BE A COMPUTER ENTREPRENEUR

The AMI Certified Agent Program puts you into business for yourself selling powerful AMI accounting software on the IBM PC-AT. There are no franchise fees, inventory or accounts receivable, only a small initial investment in the tools to get your business going. AMI trains you for success. Call Gary Gammon today at 1-800-[illegible], or ([illegible]) [illegible].

COMPUTER ENGINEERING OVERSEAS

Telemedia, Inc. an international training services company, is seeking individuals for assignment to a post-secondary educational institution in Egypt. This is a unique opportunity to be involved in the implementation of a new program leading to a BS degree. The positions are:

COMPUTER ENGINEERING DEPARTMENT HEAD

To manage instructional staff and insure that the instructional process proceeds within established guidelines. We require a minimum of 5 years experience in program management. MS in computer science mandatory. PhD is desirable. Experience in computer electronics with a background in circuit theory, digital systems, and logic circuits highly desirable. Previous overseas experience desirable.

COMPUTER SCIENCE EDUCATION SPECIALIST

To develop curriculum materials and provide instruction. We require a minimum of 4 years experience in a similar position. BS in computer science is mandatory, MS is highly desirable. Strong background in BASIC, PASCAL, and FORTRAN required. Previous overseas experience desirable.

COMPUTER ENGINEERING EDUCATION SPECIALIST

To develop curriculum materials and provide instruction. We require a minimum of 4 years experience in a similar position. Expertise in computer electronics, circuit theory, and logical systems. Familiarity with micro-computer operations. Programming ability in BASIC and FORTRAN desirable. BS in Electrical Engineering/Electronics Engineering is mandatory. MS highly desirable. Previous overseas experience desirable.

All positions will be on initial one year contract basis with possibility of renewal, and are to be filled between August 1985 and January 1986.

We provide a comprehensive foreign assignment salary and benefits package including transportation, housing and travel plus the opportunity to qualify for the Section 911 exclusion from Federal tax. For immediate consideration, please send resume to:

MICRO-TO-MAINFRAME and DATA COMMUNICATIONS

DIGITAL COMMUNICATIONS ASSOCIATES, INC., is a leader in the design, manufacturing and marketing of highly sophisticated products for high-speed multi-host to terminal networks and for micro-to-mainframe communications.

Strong growth dictates extensive needs in several key areas of software engineering, technical support, technical writing, and computer operations. DCA needs people with 2+ years experience in the following areas of expertise:

- **SOFTWARE DESIGN ENGINEERS:** protocols, packet switching, modems, multiplexors, or other C language programming for real-time communications systems; experience needed in initial design, enhancements and modifications, or in software verification and diagnostics of hardware design; appropriate degree.
- **HARDWARE DESIGN ENGINEERS:** will design circuit boards, create firmware, and purchase components (power supplies, chips, etc.), to create modules or complete products. Some software knowledge required. Need solid experience in printed circuit board design; appropriate degree.
- **APPLICATIONS ENGINEERS:** customer interface, systems specifications, site planning, overseeing installations, and network troubleshooting; need experience with voice/data networks (both hardware and software), solid understanding of distributed DP, routing, etc., and ability to work with multi-vendor networks. Atlanta, Houston, Denver, San Francisco, Los Angeles (no relocation).
- **SYSTEMS MANAGER:** manage in-house computer systems for engineering design. Handle systems fine-tuning, allocation of CPU, disk space, etc., hardware/software installation, and some utilities and software development tool programming. Need solid VAX/VMS or 68000-based UNIX/C experience; degree preferred.
- **TECHNICAL WRITER:** need 1+ year writing specifications and documentation for hardware and software. Knowledge of data communications highly preferred. 4 year degree preferred.
- **MICROSYSTEMS ENGINEER:** will work closely with customers and users on DCA's micro-to-mainframe products. Need 2+ years in user support, operations, or programming of IBM mainframe systems with specific knowledge of TSO, CICS, CMS, MS-DOS, RS-232 interfaces, etc. Excellent communication skills are needed. Atlanta, Chicago, New York City, San Francisco (no relocation).
- **SALES:** need 2+ years selling mainframe, mini or data communications equipment. Need proven expertise in over 100% quota sales and systems versus component selling approach. Expansion openings in major U.S. cities.

DCA offers a professional, yet relaxed work atmosphere, competitive salary and bonus, excellent benefits including major medical and dental coverage, eligibility to participate in tax-free retirement plan, profit-sharing, and as of this month, brand new corporate facilities in North Atlanta with in-house health club!

If qualified and interested in any of the above positions, please send resume and salary history to:

SHIFT SUPERVISOR LEAD CONSOLE OPERATOR

We are a dynamic, growing financial services organization — implementing new technology that is boldly changing the concept of consumer banking. We are Citibank (South Dakota), N.A., a part of Citicorp and a leading force in the U.S. financial community with an established presence internationally.

Our Data Center features IBM 3084QX and 3081K mainframes under MVS/XA-JES2 with 3380 DASD and 3800 laser printers. These systems drive a large CICS online network and heavy batch processing, utilizing ADABAS and OMEGA-MON.

Currently, we have exceptional opportunities at our modern Sioux Falls facility for shift supervisors and Lead Console Operators with 2 years experience. Background must encompass experience in a multiple CPU environment. A basic knowledge of JCL and laser printing is a must. The ability to work either night or day shift is essential.

We offer a convenient 3-day work week (12 hrs./day) and the enjoyable, affordable environment of beautiful Sioux Falls. You talents and abilities will be rewarded with a highly competitive salary, and benefits that include relocation, comprehensive group insurance, tuition reimbursement, savings incentives and more. The above information is intended as a guideline for computer users on relative computer system instruction cycle times. All data have been derived from published documentation and represent reasonable estimates of average MIPS ratings. However, Randolph is not responsible for the accuracy of the MIPS data. Cycle times will vary based on hardware/software configurations, and system manufacturers continually modify computer models as design improvements in hardware and software arise.

TALK TO RANDOLPH NOW. Whatever your computer system needs, Randolph can deliver the hardware when you need it....and ease the pressure on your DP budget with low lease rates. Call William Rooney, Vice President, 800-243-5307, in CT (203) 661-4200.

COMPUTERWORLD

COMPUTERWORLD's paid circulation climbed to over 126,000 this fall. Folio 400 (Folio Magazine's study of trade publication performance) placed us first in total revenue. As the industry grows, so will COMPUTERWORLD. It will continue to offer the high quality news coverage and editorial content that has attracted its readers. What does that mean to you, our advertisers? Good news...in the form of wide exposure.

The Classified section of the newspaper is laid out in an attractive format and is easy to read, [illegible] classifications to solve a variety of problems:

[illegible]

Our BULLETIN BOARD section is ideal for the smaller companies who want a low-cost way to sell pieces of equipment (hardware or software). The BULLETIN BOARD is laid out as a quick reference for potential buyers who know what they are after.

So, as a nationwide publication, we give you the exposure you want. As a weekly publication, we give you the immediacy your advertisements need.

A number of special issues of COMPUTERWORLD are scheduled to run in 1985. Each of these issues will feature one aspect of the computer industry and give our advertisers a chance to reach a more select audience. These are some of the topics the issues will cover:

- August 26 - Software Productivity Packages
- September 30 - Minis & Small Business Systems
- October 28 - Data Communications Terminals
- November 25 - Protecting The Corporate Information Resource
- December 30, 1985 & January 6, 1986 - Forecast '86

COMPUTERWORLD publishes every Monday with an ad deadline of 10 days prior to each issue date. You may send in copy to be pubset or camera-ready material (velox or negative) via the mail. We provide telecopier service and will also take ads over the phone.

Information concerning classified advertising rates, color costs, ad sizes, mechanical specifications along with more detailed information on the special issues is contained in the 1985 Rate Card #20 and Media Kit. Or from our offices.

Our mailing address is

BUSINESS OPPORTUNITY

EXPANDING TO BRITAIN OR EUROPE?

We are European market entry specialists. We move American companies into new & profitable British & European markets.

We evaluate markets, find financing, identify trading partners, arrange joint ventures & set up licensing & distribution agreements. We locate appropriate sites, cut red tape, secure permits, obtain visas & create appropriate corporate & tax structures.

We guide US companies through the intricate maze of UK/European expansion. And we save our clients a great deal of management time & money.

If you are considering expanding your business into new European markets, consider speaking to us first.

ORDER FORM COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday. The Bulletin Board is only for the buying and selling of computer equipment.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Basic Four, Burroughs, Control Data, Disk Drives and Tapes, Amdahl, Prime, Modems, Perkin Elmer, Printers, TI, Tapes, Wang, Centel, Desk Top Computers, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be cleanly typewritten. Ads must be given over the phone to our team of ad takers, or sent in writing, no camera ready material will be accepted. The standard size is 1 column by 1 inch deep. These units may be combined to form larger size ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $140.00 (One unit minimum and no fractional units allowed.) There are no agency commisions or quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap. (Available upon request: Software Wanted, Real Estate, and others).

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines. Any special artwork should be enclosed with your ad also. Logos must be submitted on white bond paper for best reproduction.

Cost: Our rates are $144.90 per column inch. (Each column is 1 13/16") Minimum size is two column inches (1 13/16" wide by 2" deep) and costs $289.80 per insertion. Extra space is available in half-inch increments and costs $72.45. Box numbers are $15.00 extra per insertion.

Billing: If you're a first-time advertiser, (or if you have not established an account with us.) WE MUST HAVE YOUR PAYMENT IN ADVANCE, or a Purchase Order Number. Any extensions on this policy must be made through our Credit Department.

INTRODUCE YOUR DATABASE TO INTELLIGENCE OF A HIGHER ORDER.

The intelligence we speak of isn't science fiction. It's science fact.

In fact, it's INFORMATION EXPERT.™ from Management Science America, Inc. The fourth generation technology that not only recognizes the limitations of database vendors but addresses them.

For example, Information Expert allows all your software systems to work in a completely new manner. Together. Whether it's with existing software or new software.

And whether you're an end user designing reports or a data processor using its fourth generation language for applications development, Information Expert is expert at both. What's more, there's even a data dictionary that helps you do in minutes what used to take you hours. Our system also allows borderless retrieval of information. So you can get all the information you need. Not all the information you don't need.

So if you want more intelligent software, go to a more intelligent software company. MSA. For more information, call Robert Carpenter at 1-404-239-2000.

Revised CICS bows

Version called 'response' to user needs, frees up usable virtual storage space

By John Gallant
CW Staff

"Long overdue but well worth the wait." That was the consensus last week of users reacting to IBM's introduction of an enhancement of its Customer Information Control System.

The product, officially known as CICS Version 1, Release 7, promises to ease the installation and reconfiguration of terminals, offers the potential to free much-needed virtual storage space, boasts improved recovery and restart capabilities and provides additional command-level functions and device support.

IBM's low-key unveiling of the latest version of its CICS transaction manager — the basis for on-line applications in most IBM mainframe environments — was met with praise from both users and analysts (see story page 8). Representatives of both groups contended that the enhancements improve the product's usefulness in supporting large networks. In an apparent effort to show concern for user needs, IBM stated that CICS was revamped in response to more than 55 requirements submitted by the Guide and Share IBM users groups (see story page 8).

"There is a great deal to be excited about in this announcement," said William Ray, manager of data and network services for Corning Glass Works, Inc. in Corning, N.Y. "CICS is now a very healthy product with a great many things that will be of value to us."

According to Frank Gens, industry analyst with International Data Corp., a Framingham, Mass.-based market research firm,

DEC profit decline less than expected

By Peter Bartolik
CW Staff

Absorbing some impact from the general decline in minicomputer sales, Digital Equipment Corp. last week reported fourth-quarter profits below its year-earlier level but higher than Wall Street analysts had projected. Of the other major minicomputer manufacturers, both Wang Laboratories, Inc. and Data General Corp. recently reported quarterly losses, while Prime Computer, Inc. reported a slight increase in profits.

In other financial news last week, Control Data Corp. said Securities and Exchange Commission objections to the company's reporting procedures caused CDC to revise its recent second-quarter report to show a loss and to revise 1984 results by cutting reported profits by 84%. Also, Cullinet Software, Inc. said it expects first-quarter profits to dip for the first time in 29 reporting periods.

Maynard, Mass.-based DEC said demand for its VAX 8600 and Microvax II products remained high. A DEC spokesman told *Computerworld* that a new, tough budget will enable the company to weather current economic conditions and to ride out DEC's first-ever fourth-quarter-to-first-quarter revenue decline.

DEC said profits for the fourth quarter were $100.4 million, or $1.66 per share, down 23% from $130.6 million, or $2.28 per share, from the same quarter a year earlier. In recent weeks, securities analysts projected that DEC's profits would range downward from about $1.40 per share.

Revenue for the quarter was $1.85 billion, up 12% compared

High marks for new Symphony

By Eric Bender
CW Staff

Initial reactions to Lotus Development Corp.'s first upgrade of its successful high-end Symphony productivity program were favorable, according to a *Computerworld* survey conducted last week of corporate beta users. "Overall, I felt very positive about the product," said Gary Schnorr, manager of office information systems at General Foods Corp., which has installed approximately 1,200 personal computers.

Schnorr emphasized the importance of the release's expanded memory capability. Working in conjunction with a new generation of memory boards — such as Intel Corp.'s Aboveboard — this capability allows users to address up to 4M bytes of dynamic random-access memory above the usual 640K-byte barrier. "To really unleash the power of Symphony," Schnorr said, "you're going to need the expanded memory." The original version of Symphony, shipped in July 1984, fit within the standard Microsoft Corp. MS-DOS memory limitation.

"Expanded memory is not something

Net gain: Firm finds multimillion dollar solution

By Paul Korzeniowski
CW Staff

ST. LOUIS — Key data processing personnel at McDonnell Douglas Corp. looked into a crystal ball in 1981 to see what the company's future networking needs would be. It was not a pretty sight.

Costs of managing its network were rising by 20% per year. Technical advances were constantly rendering current systems obsolete. Business requirements were shifting and placing additional demands on the network. Divestiture was lurking on the horizon, and the company feared it would lose the support and services that AT&T had been supplying.

In a manner that would have made John Wayne proud, the company decided to take matters into its own hands by designing and implementing what may be the largest private network in the country.

Once the company decided to build its own network, requests for proposals were sent to 30 vendors, according to Ernie H. Ridenhour, staff vice-president for information resource management at McDonnell Douglas and the one responsible for setting its telecommunications policies. The firm established a project team from various departments. The team was headed by D.C. Augustin, director of telecommunications network services at the firm.

Augustin's team considered various proposals before choosing Contel Information Systems, Inc. to handle the implementation of the network. The Contel installation at McDonnell Douglas cost $58 million and now supports 54,000 employees in 222 buildings.

Before the Contel network was installed, McDonnell Douglas' main offices here and in Long Beach, Calif., were connected by a Western Union, Inc. satellite link, 17 voice lines and 13 data lines. Regional offices were supported by these hubs with dial-up and private leased lines. All the offices used Centrex facili-

Insurer installs AT&T wiring

By John [illegible]
CW Staff

BOSTON — The nation's sixth largest insurance company here is installing a building wiring system from AT&T to support IBM terminals but will keep that cable separate from wire used to support telecommunications.

After looking at IBM's Cabling System, John Hancock Mutual Life Insurance Co. decided to install AT&T's Premises Distribution System (PDS). Like the IBM product, the AT&T cable scheme details how and with what a building can be wired to provide outlets for terminals that are similar to common electrical sockets. This obviates the need to pull new wire each time a terminal is relocated.

Hancock is installing the AT&T system in its Clarendon building, a 60-year-old, eight-floor structure that is being refurbished into modern office space in a $35 million renovation project. The building had been used for storage since the neighboring 60-story Hancock Tower was added to the company's three-building complex in Boston's Back Bay area.

When renovations are completed later this year or early next year, the Clarendon building will be used by Hancock and some of its subsidiaries, according to Michael Miele, a consultant for facilities planning. The AT&T system will primarily be used to support TSO programmers using IBM 3178, 3179, 3278 or 3279 display stations, Miele said.

The IBM terminals, which have standard plug-and-twist coaxial cable connectors, will be adapted to the four-pair strand wire used in the AT&T PDS system through baluns. Balun is a contraction taken from balanced/unbalanced and refers to the difference in electrical impedance between twisted-pair wire and coaxial cable, according to AT&T.

The flat, four-pair wire will run under the carpet from each office in the Clarendon building through a nearby column and up into the ceiling. Wire groups from the columns will then be gathered at wire closets on each floor. The wire closets house patch panels that enable office outlets to be cross-connected to achieve desired configurations.

The closets on each floor also terminate AT&T fiber-optic cables that run down through the building's vertical risers into Hancock's Berkeley building next door, Miele said. Hancock has moved all of its terminal controllers back into the Berkeley building, which houses the firm's processing facilities. Each of the roughly 25 IBM 3274-type controllers — now locally attached — can support up to 32 remote terminals through a pair of fiber-optic cables. The fiber-optic pairs are outfitted with multiplexers from Fibronics International, Inc.

Miele said that locally attaching the controllers improves terminal response time and facilitates cable coordination. Use of the fiber-optic pairs enables the terminals to be located at such distances from the controllers, but the copper-pair wire running from the fiber termination point in the wiring closet to the workstation cannot exceed 400 feet, Miele said.

> ”
>
> *The AT&T cable scheme details how and with what a building can be wired to provide outlets for terminals. This obviates the need to pull new wire each time a terminal is relocated.*

Hancock chose to wire the PDS system separately from the wire harness used with its AT&T System 85 private branch exchange. "We were worried that we might experience things like cross talk if we put telephone traffic on the same cable with data running at 2.3M bit/sec.," Miele said.

Asked if AT&T had tried to convince Hancock to support the terminals with the System 85, Miele said he believed the heavy TSO traffic would bog down the PBX. "We're still looking for a local-area network, but today local nets are not ready for the Hancock environment; we're strictly [IBM Systems Network Architecture/Synchronous Data Link Control]."

Miele estimated that the AT&T system costs roughly $300 per outlet to install.

Last year Hancock relocated roughly 60% of its employees. Generally, each time a person with a terminal was moved, the workstation had to be rewired. With PDS, Miele expects to save about $200 per move or installation.

CORRECTIONS

A chart reporting recent layoffs in the computer industry incorrectly listed the number of employees laid off at Honeywell, Inc.'s Small Computer and Office Systems Group [CW, June 24]. There were 120 workers dismissed. Also, the name of Honeywell's Synertek division was misspelled.

An item in the *Softscope* column of June 24 incorrectly depicted the relationship between Digital Equipment Corp. and Cincom Systems, Inc. Although DEC will market and promote Cincom software as a result of a joint agreement, Cincom will continue to supply the products.

In the chart "Users rate their minis" [CW, July 22], the column representing IBM's System/38 was mislabeled System/36.

Contrary to information published in the "Random Access" column [CW, Aug. 5], Digital Equipment Corp.'s External Document Exchange software enables machines ranging from the DEC VAX-11/725 to the VAX 8600 to exchange read-only and revisable form documents with IBM Distributed Office Support Systems hosts.

CONTRARY TO ALL OF IBM'S ARGUMENTS, TWO DATA BASES ARE NOT BETTER THAN ONE.

"I see fourth quarter profits up 27%.
But on the other hand..."

According to IBM, the best system for delivering flexibility and performance is two systems, a relational system for the information center and a hierarchical system for the production center.

To some, this proposition may seem like the logical way to get the best of both worlds. But consider the superior logic of a single system that does both. ADR/DATACOM/DB®, our high performance relational data base management system (DBMS).

ADR/DATACOM/DB delivers the flexibility end-users need as well as the performance high volume production demands. So it eliminates the need for a redundant DBMS.

ADR/DATACOM/DB allows you to consolidate all your company's information into a single pool the entire company shares. So everyone, from PC user to programmer, uses the same exact data base to get the same exact information.

And with a single data base with only one set of data there can be no overlapping or conflicting data. So, the information everyone uses is consistent, up to date and, most important of all, accurate. Which, unfortunately, is something no redundant system can promise.

And should you need summaries of data, ADR/DATACOM/DB can produce and maintain them. Easily. Directly from the information in the corporate data base. And using the same exact DBMS. So ADR/DATACOM/DB uses fewer computer resources, human resources and, in turn, less of a resource management is very interested in—money.

Practically everyone in the software industry acknowledges that a single data base system is better. So the only question that remains is why some software companies continue to embrace the dual data base system. And the answer to that is simple. They just don't have a single system that can do it all.

For a multitude of other reasons why the single data base design of ADR/DATACOM/DB is superior, mail us the coupon. Or call 1-800-ADR-WARE.

DBMS helps foundation handle 'information overload'

By Charles Babcock
CW New York Bureau

NEW YORK — The Exxon Education Foundation has tested Team-Up, a data base management system, on its local-area network for six months, and the results indicate it will be able to handle what had been "a massive information overload."

So reported Richard R. Johnson, the foundation's research director. The foundation has spent two years looking for a data base management system, hampered by a paucity of local-area network products. Major software houses are beginning to bring network systems to market but "at the beginning of 1984, there was virtually nothing," said Joel Levy of Wohl Associates of Bala Cynwyd, Pa.

By mid-1984, foundation staff members had tried two systems, Datastore from Software Connections, Inc. in San Jose, Calif., and Team-Up, previously Informa DBMS, from Unlimited Processing in Jacksonville, Fla.

Random changes not accepted

The early version of Datastore had a glitch in a conversion routine that "caused 1983 to become 1984" when the foundation transferred its records from a minicomputer to its Ungermann-Bass, Inc. local-area network. Datastore was user-friendly and performed well as a DBMS, but "we will not accept random changes in our data," Johnson said.

The version of Informa that preceded Team-Up also had its drawbacks. It was limited to 8M bytes of file memory, and the foundation, with "thousands of documents coming and going day to day," quickly filled it up, Johnson said.

Prior to its attempts to use Datastore and Informa, the foundation had installed a Datapoint Corp. Attached Resource Computer network, but found it could not be linked to its Exxon office equipment. The Datapoint minicomputer had to be custom programmed for each application, and an attempt to implement a business-letter-writing program cost $20,000. "Every time we turned around to do something, the software costs would eat us alive," Johnson noted.

Another major concern was knowing where the foundation stood relative to its budget. "We were months behind with the Datapoint system," the research director said.

So in early 1985, the foundation installed the Team-Up package, the version of Informa that included an application and report generator.

Team-Up "was much more powerful. Suddenly we had a management tool that would keep us up-to-date," Johnson said.

The foundation, with a staff of 11, is Exxon's nonprofit agency for making charitable grants to educational projects. Representatives of educational institutions passing by Exxon's World Headquarters in New York stop in to chat about funds, and 6,000 to 8,000 formal applications are kept on hand, Johnson said. It must maintain files on 2,000 active grants. In 1985, the foundation will give away $32 million, Johnson said.

> ”
>
> *'Every time we turned around to do something, the software costs [of the Datapoint mini] would eat us alive.'*
>
> — Richard R. Johnson
> The Exxon Education Foundation

Because its work lies outside the main business of Exxon, the foundation enjoys more autonomy than many other offices. Although it had to get permission to hire outside consultants for its local-area network, the foundation did not have to go through central purchasing to get its 11 IBM Personal Computers and Personal Computer XTs, Johnson recounted, and this helped it set up its network quickly.

The foundation located the Team-Up package through its consultants, the Institute of Public Services Performance, Inc., a small New York firm that specializes in helping nonprofit agencies with microcomputers.

Suggestions added to beta version

The foundation is beta testing Team-Up, and part of the package's acceptance stems from the fact that the foundation also served as an alpha test site for an earlier version known as Informa. The foundation staff suggested improvements to the product that found their way into the beta version — such as expanding the memory limit for files, according to Johnson.

The system offers the advantages of a true relational data base management system in that updating data for one application updates it for all applications, Johnson said. In addition, multiple indexes may be used, which aid in the search for particular grants.

Additional records may be added to existing files through the Extend utility. Nonrelational systems require precise record definition upon creation of a file and cannot be altered afterward, he said.

In a similar vein, additional records in a Team-Up file may be indexed after the initial index definition through the Reindex utility.

The foundation is developing a program that will, when one set of data is updated, automatically update related data, such as budget or payment totals. It will run as a Personal Computer batch program on the network. Automatic budget updating "solves one of the major problems of managing a foundation," Johnson said.

The foundation staff frequently receives calls for information about the status of grants. Under Team-Up, they can call up a Review program that presents the evaluation of an application, while a control C command fills four additional screens of information. Johnson said the related information, such as how much money has been paid out or when a report is due from the recipient, is available but will not be stored in the Review program when the user is done. "This is critical for managers," who can usually retrieve all the information they need in "the time it takes to transfer a telephone call to them," Johnson said.

File protection feature

On any network, the ability to prevent disruption of files because of multiple contention is important, and Team-Up offers file protection. If Johnson is viewing a file and someone else changes it, he is both notified that a change has occurred and informed what the change is. In other systems, the second user would often be notified that a change had occurred and, at that point, be frozen out, said Stanley Altman, one of the institute's consultants. With Team-Up, the second user can reenter a change to the same record without going out of the program.

Team-Up, with a stated capacity of 32,000 applications with 700,000 files, is large enough for the foundation's purposes, Johnson said. It can access any record in a 35,000-record file in 1.1 seconds, Unlimited Processing spokesmen said.

Several levels of security control the access of each user to applications or files. When a user deletes a file, for example, it is stored in a manager's area for review, because a manager must make the final decision to delete, Johnson said.

Johnson cites one drawback to the system. It relies on a Davong Systems, Inc. hard disk for central storage, and that company is in reorganization proceedings of Chapter 11 under the Federal Bankruptcy Act. Ungermann-Bass has announced it will stop supporting the Davong hard disk at the end of the year, and Johnson said his office will have to buy the recommended replacement.

Buyers have few choices in local-net DBMS market

NEW YORK — Unlimited Processing, Inc., which started shipping its Team-Up data base management system to customers in July, is a 4-year-old, 22-employee company in Jacksonville, Fla., founded to produce multiuser software.

Its first network data base system, Informa, went through three versions before coming out as Team-Up Version 1.1. Team-Up has about 100 users, many of them beta test sites, Unlimited Processing spokesmen said.

Team-Up runs on 13 local-area networks, including 3Com Corp.'s Etherseries; Corvus Systems, Inc.'s Omninet; IBM's PC Network; Novell, Inc.'s Netware; Microsoft Corp.'s Networks; Digital Research, Inc.'s Concurrent DOS; and Ungermann-Bass, Inc.'s Network One.

"There are very few products on the market. No standards have been set, and the whole networking software [technology] is in its infancy," noted Melody M. Johnson, who follows office systems for the Seattle investment bank, Cable, Howse & Ragen.

Competing products at this point include Dataflex from Data Access Systems, Inc. in Miami, Fla.; Knowledgeman from Micro Data Base Systems, Inc. in Lafayette, Ind.; Metafile from Sensor-Based Systems in Glenview, Ill.; and Datastore from Software Connections, Inc. in San Jose, Calif.

The Exxon Foundation tried Software Connections' Datastore but discovered "random changes in our data" while transferring records. Attempts to clear up the problem with the vendor met with disbelief and unreturned phone calls, said Richard R. Johnson, research director.

Software Connections' Product Marketing Manager Gary Kwok acknowledged that a glitch occurred in a conversion routine of the first version of Datastore, a problem that has since been cleared up. He added that the problem occurred before Software Connections established its technical support unit and Exxon's complaint "fell through the cracks. Now it's come back to haunt us," he said.

TURBO

Why are SYBACK & SyncSort CMS the fastest things on no wheels?

(More technology in the tank!)

Call (201) 568-9700.

Arrange a test drive.

You say you've always had very simple tastes? All you ever wanted was the best?

Well, step into our showroom and kick a few tires! We'll show you two programs that are the Ferrari and Lamborghini of VM programs.

- **SYBACK – the world's fastest and most maneuverable backup, restore and copying program;**
- **Syncsort CMS – the world's fastest and most maneuverable VM/CMS sort program.**

What makes 'em so special? Well . . .

(1) TURBO PERFORMANCE: Have you ever stepped down on the gas in a dangerous driving situation and discovered . . . nothing? Well, that'll never happen to you with these two vehicles.

Both are equipped with our special brand of "software turbocharging." We call it FBT, which stands for Fluid Buffering Technique. Our competitors call it something else.

We discovered FBT one dark and rainy night when we were trying to find a way to speed up the movement of data in sort programs. After crying "Eureka," we applied it to our OS and DOS sort programs. The results were . . . wow!

Now we've carried that bright idea over into VM dump-restores and sort programs. And the results are still wow! Compared to any other backup or sort program clogging the nation's VM thruways today, SYBACK and SyncSort CMS will save you up to:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **55% in TTime;**
- **75% in SIOs.**

So who needs all that speed? You do. If you want to optimize your VM operations, stay out of needless DP traffic jams, and make the boss happy with your throughput.

Here's what happened to one large government agency: Their backup operations used to require a full 24 hours to complete. Then they installed SYBACK. Now their backup takes — are you ready? — one-half hour!

(2) EASY HANDLING: SYBACK and SyncSort CMS are among the most flexible, user-friendly programs ever produced by anybody anywhere. That's one reason programmers love 'em. And where does it say that backup and sort operations have to be hard to be good?

(3) "MISTER SOFTWRENCH" SERVICE: We've got the best pit crew in the business. More than 85% of all customer requests are resolved within 24 hours.

If you'd like to put a little high technology in your VM tank, give us a call. We might even take your used VM dump-restore or sort program as a trade-in!

Justice probes allegation that Hitachi dumped chips

By [illegible]
CW Staff

SANTA CLARA, Calif. — Cries from the semiconductor industry charging unfair trade practices on the part of Japanese chip manufacturers are beginning to fall upon receptive ears.

The U.S. Department of Justice has launched an investigation into accusations that Hitachi Ltd. is illegally dumping semiconductor chips into the U.S market by cutting prices below production costs.

News of the investigation was made public here by U.S. Sen. Pete Wilson (R-Calif.) at a hearing by a subcommittee of the Congressional Joint Economic Committee held to investigate trade practices of Japanese chip makers.

Wilson had requested such an investigation following disclosure of an alleged Hitachi memo that instructed distributors of its erasable programmable read-only memory (Eprom) chips to undercut by 10% Eprom chip prices quoted by Hitachi's U.S. competitors [CW, June 17].

Hitachi's Hiroshi Miyamoto, based in Washington, D.C., told *Computerworld*, "We are cooperating with the Justice Department in its investigation, and we are confident that when the investigation is completed the allegation of predatory pricing will be shown to be totally unfounded."

Series of positive signals

The Justice Department investigation is one of a series of positive signals recently sent by the Reagan administration to the ailing semiconductor industry, currently in the midst of the most serious economic downturn in its history. In other recent moves, the U.S. International Trade Commission ruled in favor of Micron Technology, Inc.'s dumping claims against seven Japanese chip makers. That case is now before the U.S. Department of Commerce and could result in import duties for Japanese semiconductor firms.

Last week's hearing of the Joint Economic Committee's Subcommittee on Trade, Productivity and Economic Growth was prompted by a petition from the Semiconductor Industry Association (SIA) asking that the U.S. government demand increased Japanese purchase of American semiconductor chips. According to Daryl Hatano, SIA manager of government affairs, Section 301 of the 1974 Trade Act allows the president to take such actions against countries believed to be pursuing discriminatory trade practices.

Hitachi representatives did not attend the opening subcommittee hearing but will testify in later subcommittee hearings, Wilson said. The company recently responded to U.S. manufacturers' charges of unfair trade practices by announcing it will increase its U.S. chip purchases by $120 million by the end of next year.

In his testimony before the congressional panel, Charles Sprock, president of National Semiconductor Corp., called the Hitachi purchasing announcement a grandstand play. "We must insist upon fair trade before permanent damage is done to the industrial base," he said.

'Equal access to every market'

George Scalise, senior vice-president at Advanced Micro Devices, Inc. (AMD), underscored the SIA stance. "We have to have equal access to every market," said Scalise, who indicated that AMD has been seriously affected by the Japanese 10% undercut of the 64K-byte Eprom market.

To correct the imbalance, Scalise proposed that the U.S. should launch an affirmative action program to freeze Japan's U.S. market share until there is parity in penetration.

Past efforts by U.S. manufacturers to increase their share of the Japanese market have failed, Scalise said, and the U.S. semiconductor industry continues to hold a 10% market share in Japan, compared with a 55% market share throughout the world.

SYMPHONY

from page 1

I'm going to promote through the company, but it can really come in handy," according to Robert Martin, manager of decision support systems at Cleveland's Eaton Corp. Martin, whose group supports more than 400 micros, said that expanded memory "bailed us out of several applications in sorting a large data base where the program runs up against a memory barrier." He said he found no bugs in running Symphony 1.1 with Intel's Aboveboard.

Eric Haskell, vice-president for finance at Transamerica Delaval, Inc. in Lawrenceville, N.J., which has approximately 225 personal computers, mentioned the expanded memory capability favorably. However, Haskell said, he doubts his firm will take advantage of the feature for more than 10% to 15% of its machines.

More important, Haskell said, is the Symphony 1.1 spreadsheet's revamped memory allocation scheme, and he found that his beta copy did use RAM more efficiently.

Users commented favorably on other enhancements of the Symphony program. These include coprocessor support, Macro Library Manager, upgraded command language and spreadsheet compatibility with a scheduled upgrade of Lotus' 1-2-3 program.

In regard to coprocessor support, users noted the potential for the Intel 8087 and 80287 numeric coprocessors to boost performance significantly. "I've done a good bit of testing with it, and we're very pleased," Martin said.

The release's speed is close to the original version's, he noted. "We've perceived and measured some time improvements. There are instances where it runs slowly, but those are few and far between. If there's much crunching going on, there's no question it's running faster."

Symphony 1.1's Macro Library Manager, commonly called "Hyperspace," permits users to store macros, numbers, labels and named ranges outside the work sheet. Although it is not for every Symphony user, Hyperspace is a helpful feature, users said.

"Very sophisticated things can be done" with the enhanced Symphony Command Language, Schnorr said. His group intends to use Symphony as a development tool for front-ending host applications, helping to establish consistent user interfaces.

Symphony 1.1 will offer spreadsheet compatibility with the upcoming release of 1-2-3, according to Lotus. With many users sticking with 1-2-3, "that will be a very important feature for us," Martin said.

Relatively few complaints surfaced, but one that was mentioned was the product's inability to fit the new Symphony on a diskette with IBM PC-DOS.

Another was the continued requirement for a key disk on hard disk drive systems, which Martin described as a minor annoyance. Lotus is not the only vendor with that requirement, "and that's the only reason it's a minor annoyance," he said, adding that Lotus soon may be the only one.

Priced at $695, Symphony 1.1 runs on the IBM Personal Computer and compatibles and includes spreadsheet, word processing, data base management, graphics and communications functions. An upgrade from Symphony 1 costs $75.

Symphony made simpler

Reviews of the original Lotus Development Corp. Symphony software described the package as hard to install, learn and use. Although Lotus downplays those criticisms, the firm said that its latest release of the integrated package, Symphony 1.1, addresses them all.

The complicated installation procedure has been cleaned up considerably, early users agreed. "Just about the time I memorized the old one, they improved it," according to Robert Martin, manager of decision support systems at Cleveland-based Eaton Corp. (see story page 1).

Most early users spent little time with the revamped documentation and tutorial, so they gave no solid evidence on how effective those upgrades have been. However, some emphasized that Symphony may have been given a bad rap on ease-of-learning and ease-of-use issues, which are inextricably linked to the package's ambitious scope.

"I was one of those saying, 'There's too much to learn,' " Martin said. "I think I fell into the trap of comparing it to [Lotus'] 1-2-3. We discouraged 1-2-3 classes around here; you could learn it a lot better under pressure.

"Since then I've turned around; I no longer call it a criticism," he said. "When you have a big job to do, you want to make it easy to do, but it's still a big job. I'm willing to accept the fact that the learning curve will be slow."

General Foods Corp.'s manager of office information systems, Gary Schnorr, also said he felt that it is an unfair criticism. "People were trying to learn five applications at the same time," he said. "If you take it in a logical procession, it's as easy as any package."

"A lot of people have gotten over the difficulties," said Dan Spiner, president of Management Information Software, a New York reseller. Symphony is "really serious" software, Spiner emphasized.

Symphony users also stood up for the concept of the all-in-one application package. "In my mind, there's a common misconception that integrated software is failing and that the only answer is integrating, windowing software," said Eric Haskell, vice-president for finance at Lawrenceville, N.J.-based Transamerica Delaval, Inc.

However, he maintained, "a lot of the euphoria of the early [personal computer] influx is over," and users would rather learn one package than play with several. "Integrated software solves that [problem] better than windowing software."

FINANCES

from page 1

with $1.66 billion a year earlier. Equipment sales increased only 7%, however, while revenue from service and other sources generated more than half of the total increase.

Although this was the second consecutive quarter in which DEC profits declined in comparison with the respective year-earlier periods, the fiscal year was closed out with a 20% increase in revenue to $6.68 billion from $5.58 billion the previous year. Profits for the year were $446.7 million, or $7.42 per share, up from $328.8 million, or $5.73 per share.

In a prepared statement, DEC President Kenneth H. Olsen said the company kept inventories below the year-earlier level and ended the year with cash reserves in excess of $1 billion.

Foreign sales remained strong

He also said foreign sales remained strong, but some U.S. customers were postponing purchases. A spokesman later said that domestic sales in the quarter were flat or down slightly from the year-earlier quarter.

Some analysts have expressed concern that the company's unofficial no-layoff policy could squeeze profit margins during the next few months as economic pressures and seasonal adjustments impact the company.

But Mark A. Steinkrauss, director of investor relations with DEC, said the company believes it has implemented a correct business plan. "We understand the concerns, and from many perspectives, it could be a tough quarter, but we feel pretty confident about it," he said.

"We have implemented a tough new budget that is very conservative in terms of growth," Steinkrauss said. The company reduced its manufacturing work force through attrition during the year, but that has been offset by an increase in the number of sales employees.

Steinkrauss said the company has trimmed delivery dates on its VAX 8600 model to three to four months from original estimates of four to five months. He also disputed contentions that demand is less than the company had anticipated. He said fourth-quarter shipments more than doubled from the 140 units shipped in the third quarter.

While the performance level of the Microvax II has led to concern about sales of mid-range products, Steinkrauss said that sales of the VAX-11/750 and VAX-11/850 have held up well in comparison with previous years. "Below the [VAX-11/750] level, sales will probably tend to decline," he said.

Second consecutive losing period

In Minneapolis, CDC spokesmen said objections by the SEC staff compelled the company to reduce fourth-quarter 1984 earnings by $26.5 million, resulting in profits for the year of $5.1 million, or 12 cents per share. The recently reported second-quarter profits of $3.8 million [CW, July 22], or 10 cents per share, was revised to produce a loss of $4.8 million, or 12 cents per share, marking the second consecutive losing period for the company.

CDC said the SEC staff objected to the recording of tax benefits related to discontinuance of its plug-compatible disk drive business and to the method of reporting losses from Earth Energy Systems, Inc., in which CDC owns a majority interest.

Also, CDC said a financial subsidiary posted a second-quarter loss that had not been reflected in the July report.

In Westwood, Mass., Cullinet said it expects to report later this month a $4 million profit for the first quarter, down from $5.5 million a year earlier, and a revenue increase of only 4% to 5% from the year-earlier period. The reversal from several years of 50% sequential quarterly increases in profits and revenue was attributed to delayed orders resulting from current economic conditions.

But John J. Cullinane, chairman and founder of the software firm, said he remains optimistic about future results.

CATV data service OKed

WASHINGTON, D.C. — The Federal Communications Commission opened the door last week to allowing CATV firms to provide interstate data transmission services.

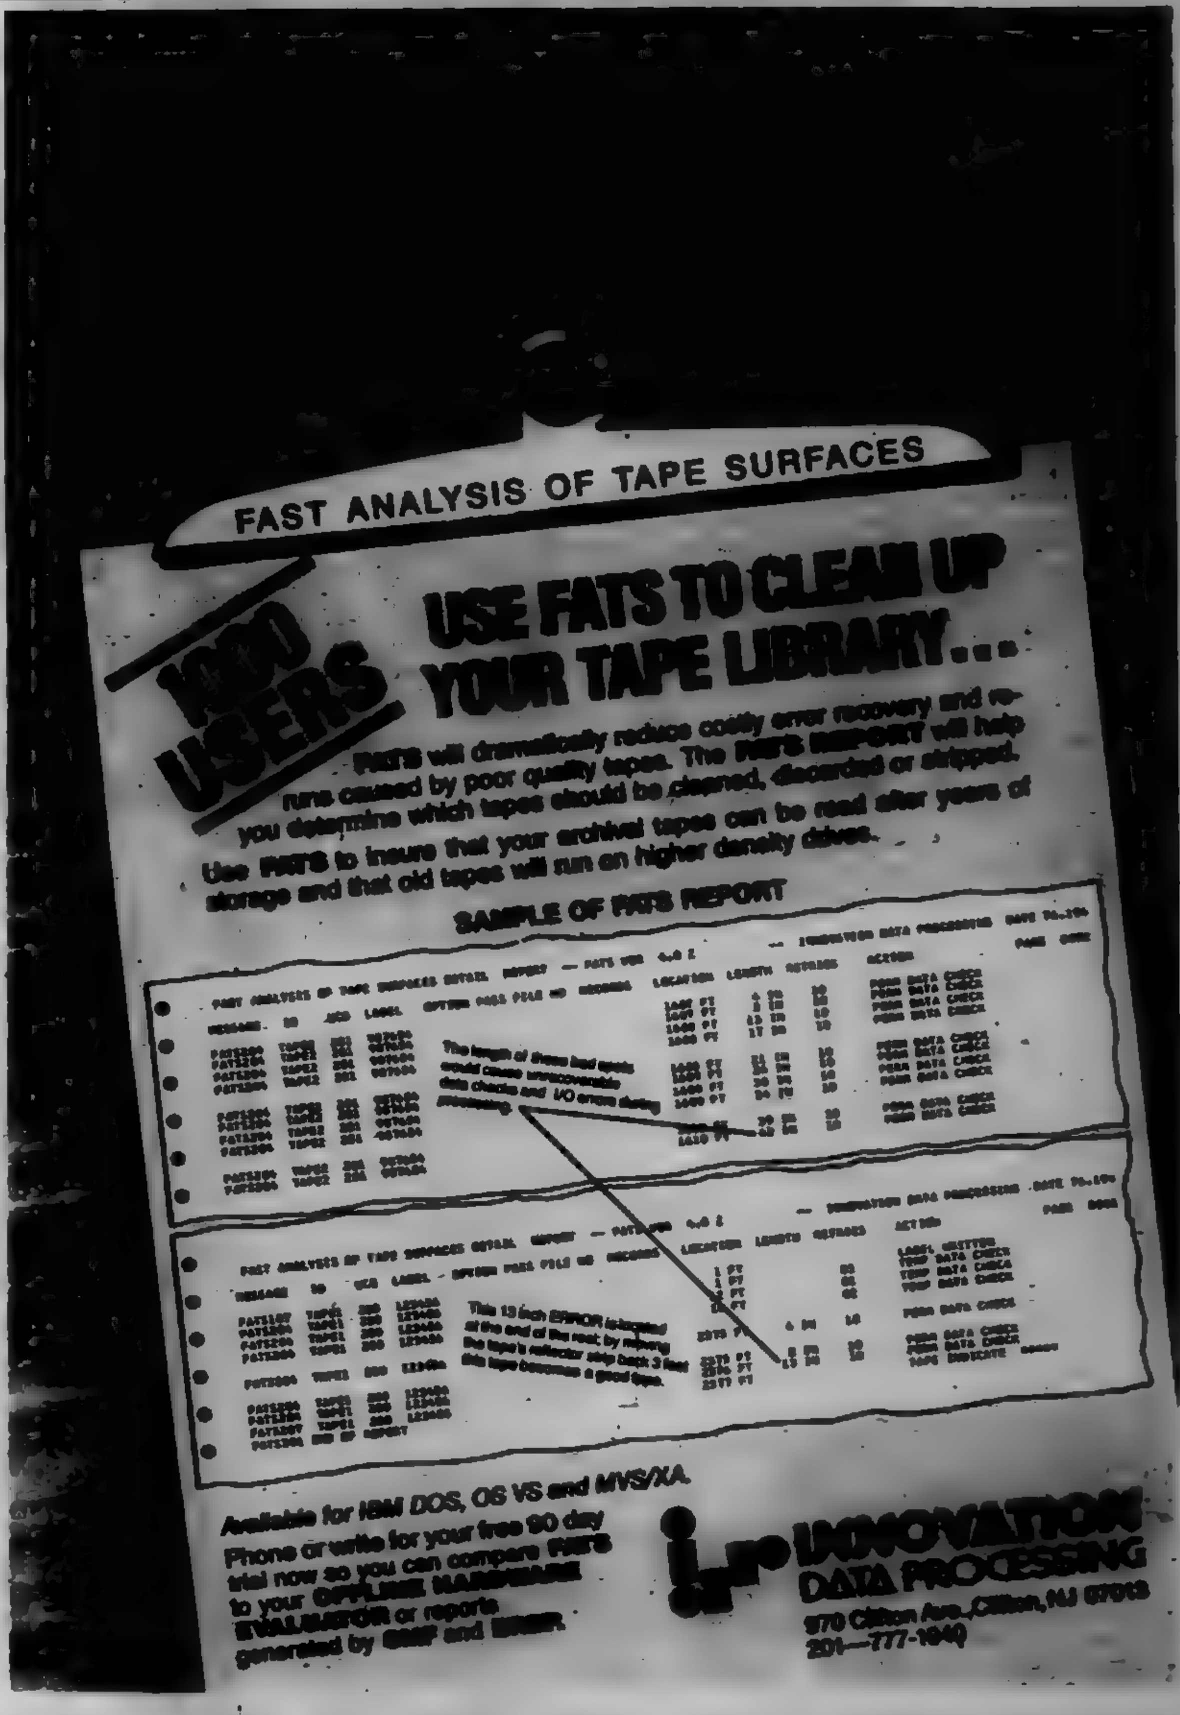
The FCC ruled that states may not impose any regulation that would block CATV companies from offering voice/data transmission services over interstate facilities because doing so would inhibit interstate competition.

The declaratory ruling was prompted by the case of Commline, Inc. of Omaha, a subsidiary of Cox Cable Communications, Inc. that provides dedicated, high-speed digital transmission service — including interconnections with MCI Communications Corp.'s interstate networks — to business and institutional customers in Omaha.

In April 1983, the Nebraska Public Service Commission ordered Cox to drop the service.

The FCC justified its preemption of Nebraska state authority on the grounds that Commline's service includes interstate as well as intrastate traffic, officials said.

FCC officials said the precedent-setting Cox decision will be applied on a case-by-case basis in all states to tear down state regulatory barriers that currently prevent CATV firms from entering interstate transmission markets.



FAST ANALYSIS OF TAPE SURFACES
1000 USERS
USE FATS TO CLEAN UP YOUR TAPE LIBRARY...
FATS will dramatically reduce costly error recovery and reruns caused by poor quality tapes. The FATS REPORT will help you determine which tapes should be cleaned, discarded or stripped.
Use FATS to insure that your archival tapes can be read after years of storage and that old tapes will run on higher density drives.
SAMPLE OF FATS REPORT
The length of these bad spots would cause unrecoverable data checks and I/O errors during processing.
This 13 inch ERROR is located at the end of the reel; by replacing the tape's reflector strip back 3 feet this tape becomes a good tape.
Available for IBM DOS, OS VS and MVS/XA.
Phone or write for your free 90 day trial now so you can compare FATS to your OFFLINE HARDWARE EVALUATOR or reports generated by SMF and EREP.

CICS

from page 1

Version 1, Release 7 addresses some major deficiencies that have plagued CICS since its inception in 1973. "What this does is resolve a primary drawback of CICS, the requirement to bring the system down to define or reconfigure resources," Gens said.

Gens was referring to the extension within the release of the Resource Definition On-line (RDO) facility.

Ability to define devices dynamically

This enhancement allows a user to define a new device dynamically, such as an IBM Vtam-attached terminal, while CICS is running. An IBM spokesman said the enhancement eliminates the requirement to reassemble the CICS terminal control table.

The previous release of CICS gave users the ability to define programs, files and transactions dynamically.

Users interviewed by *Computerworld* said most large data centers typically compile a backlog of terminal changes and routinely schedule CICS outages of two hours or more to reassemble and install terminal control tables. The RDO extensions will allow systems programmers to add terminals in a matter of moments whenever necessary, giving users more flexibility in reconfiguring their resources.

In addition, CICS now provides an automatic installation capability that spares users from defining a terminal to CICS if it has been previously defined to Vtam.

The spokesman said the alternative to explicit definition of a terminal reduces the need for definitions, the storage they consume and the effort required to manage them. Terminals can also be defined so that their definitions are shipped automatically to a CICS system, making a single definition of a terminal in a CICS network sufficient.

Users said the amount of virtual storage freed by the automatic installation facility and other CICS enhancements would vary from shop to shop but could range from a 1M-byte savings to as much as 4M bytes.

"The most important change is in the implementation of the terminal control table," said Harvey Kramer, senior information systems consultant with Southern California Edison Co. in Rosemead, Calif.

"By not having to predefine terminals we may get up to a three to four megabyte buy-back in virtual storage," Kramer said.

CICS users also cited potential time savings from enhancements to the recovery and restart facilities of CICS.

Emergency and so-called warm restarts are improved because the opening of Vsam and Bdam data sets is deferred until the data sets are referred to by a specific application.

Also, Vsam and Bdam files can be allocated while CICS is running rather than during job-step initialization.

Reduced need for reinitialization

"If you have a failure in your system, you can restart more quickly because IBM has reduced the number of systems and files that have to be reinitialized," Gens said.

"You can initialize those data sets and applications as they are required rather than right at the beginning," Gens explained.

The enhanced release of CICS also features added command-level programming facilities that provide an interface to the system spool files maintained by IBM's JES2 and JES3.

The facilities allow applications to write and retrieve records directly to the JES spool.

Users said that this improvement will give programmers the capability to address a new class of applications that draw information from batch systems.

CICS upgrade addresses long-overdue requirements

By John Gallant
CW Staff

The fortified release of CICS does not represent a bold technological foray on IBM's part, users and analysts told *Computerworld* last week. But the product's enhancements meet some very real needs — needs some observers said have gone unaddressed for too long.

"This is clearly one of the most important software announcements in recent memory," said William Ray, manager of data and network services with Corning Glass Works, Inc., in Corning, N.Y. The company supports more than 1,500 terminals under CICS on an IBM 3081K processor. "Adding new devices or reconfiguring terminals is a big task for us. We spend a lot of time changing [terminal control] tables. I would like to have seen these changes sooner."

Both Ray and Donald Langston, associate director of Schering-Plough, Inc.'s Memphis data center and corporate computer operations, lauded CICS's new support for on-line definition of terminals. Schering-Plough supports about 1,000 terminals through CICS on a 3084 mainframe under MVS/XA. The company routinely scheduled CICS downtime of two hours or more to reconfigure its network.

"This release has addressed a key issue in continuous operation of data centers," Langston said. "It gives you an opportunity to reduce the number of scheduled CICS outages. We typically wait until we have a number of terminals to add and schedule CICS downtime. That impacts planning and application implementation schedules, which have to be geared to the outage."

But, Langston added, "These requirements have been outstanding for years. The desire by users not to have to take CICS down to make changes has existed since CICS came out."

Growing importance of CICS

John King, executive director of the San Jose, Calif.-based James Martin Associates consulting firm said the announcement marks an acknowledgment by IBM of the growing importance of CICS — one of its most widely installed mainframe software products.

"The most important aspect of this [announcement] is that IBM has recognized the strategic importance of CICS and has brought it into the real world of large networks," King said. "IBM appears to be slowly moving to a point where a systems programmer can have a single view of the entire network, where users can reconfigure and expand a network without huge numbers of people."

King's comments were echoed by Frank Gens, industry analyst with International Data Corp., a Framingham, Mass.-based market research firm. "The release addresses old criticisms of IBM's communications products. It was said that if IBM ran the telephone company it would have to shut the whole system down to add a phone. This is just another situation where IBM is struggling to catch up with a product that has had some major deficiencies. It is not a bold new step or a new direction. But it does make a cornerstone product more usable and functional."

Users agreed that the largest sites — those that face time-consuming network reconfigurations — will benefit most from Version 1, Release 7 of CICS. But, said Christopher Gruchawka, senior technical manager with the Bogota, N.J.-based CICS consulting and education firm Interactive Solutions, Inc., end users will benefit along with DP professionals.

'Attack a new class of applications'

"This is not only significant to systems programmers and network managers," he said. "It is important to users because it will reduce the backlog and waiting involved in restructuring a terminal environment. It will also allow developers to attack a new class of applications that access information in the JES2 and JES3 batch spools."

Observers also emphasized the importance of the enhanced version as a base for future software enhancements. "The release is vital in that it lets users keep their terminal control tables smaller and save on virtual storage," Gens said.

"That is a big issue for CICS users who are in a bit of a squeeze waiting for IBM to announce an [Extended Architecture] version of CICS. This gives them a little bit of relief until then."

IBM 'sensitive' to user needs

"CICS Version 1, Release 7 addresses numerous user requests and satisfies the following requirements submitted by the Guide and Share user groups."

With that brief commentary in its announcement of the new release of CICS, IBM proceeded to outline more than 55 requests and requirements that it had satisfied in the enhanced offering. Whether it was a marketing or public relations maneuver or a sincere attempt by IBM to recognize the work of the two largest IBM users groups, the acknowledgment surprised and impressed users.

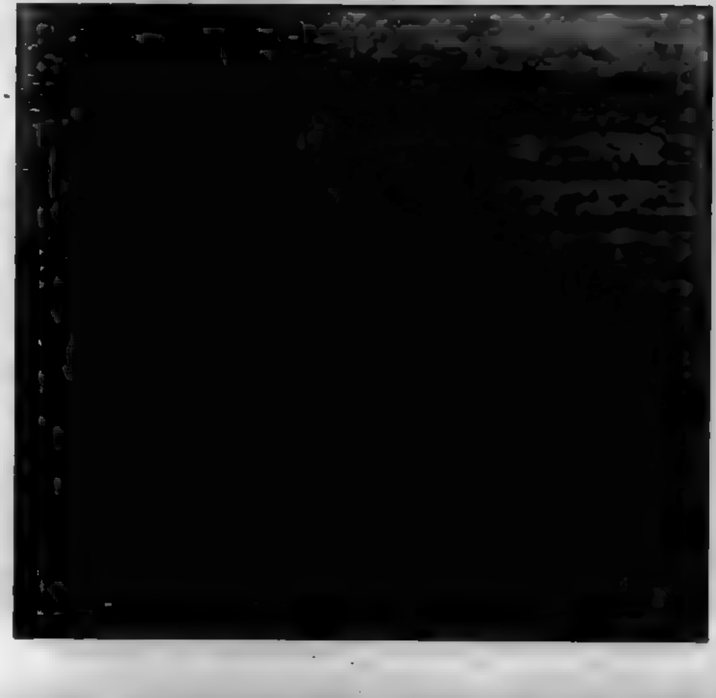
"Of course, part of it is marketing," said Donald Langston, associate director of Schering-Plough, Inc.'s Memphis, data center and corporate computer operations. "But I think IBM was really trying to demonstrate that it is sensitive to users' requirements," he added.

Harvey Kramer, senior information systems consultant with Southern California Edison Co. in Rosemead, Calif., said the recognition was IBM's way of underscoring the importance of users groups.

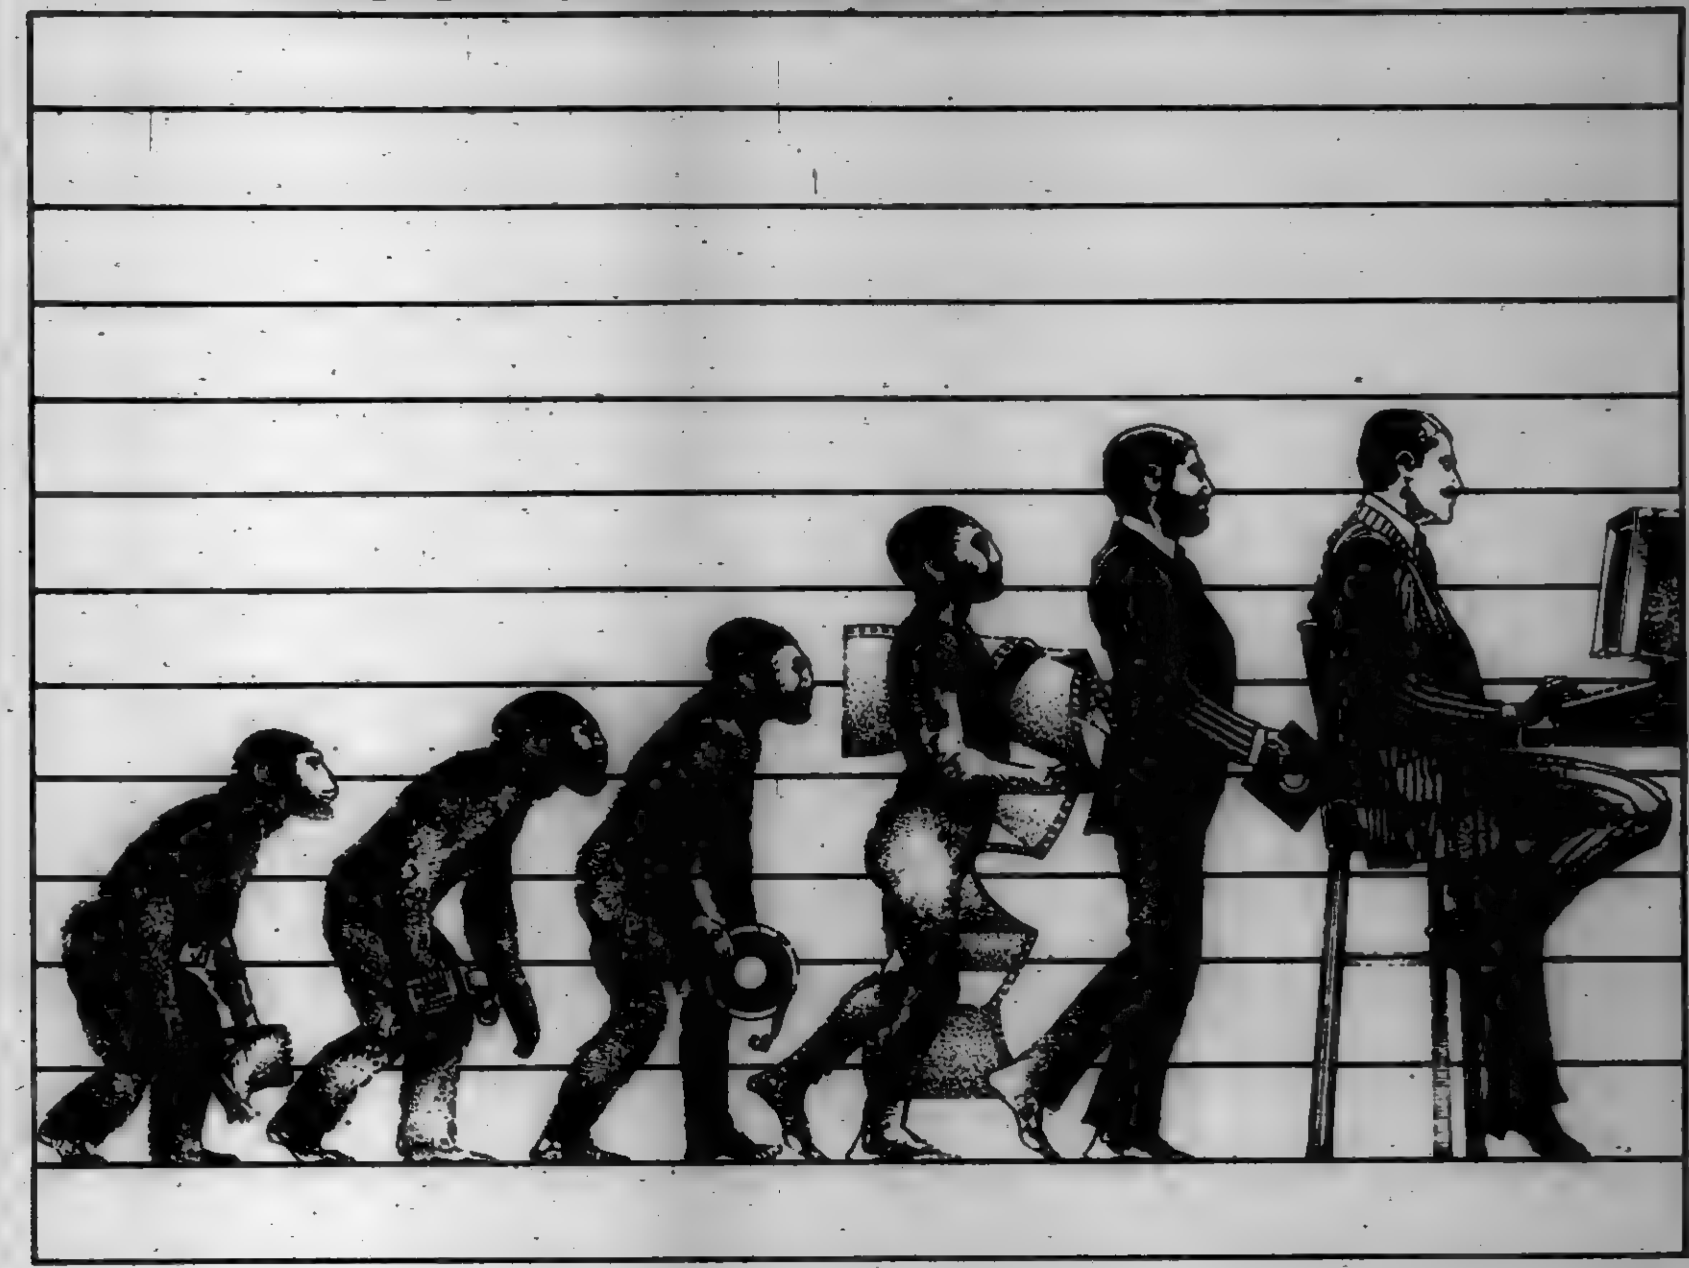
"User groups represent multiple customer interests," Kramer said. "IBM is saying that this is the way to get your voice heard. IBM cannot take care of everyone, but it can address the things that are of high priority to a variety of companies."

While Langston is manager of Guide's Data Base & Data Communication Division, and Kramer is deputy manager of Share's CICS Project, both men said that they spoke for their firms and not as representatives of their users groups.

— John Gallant



A HISTORY OF DECISION SUPPORT SOFTWARE



Comshare's System W goes beyond up-to-date.

A 1970's business modeling system with bolted-on data management capabilities is as up-to-date as a wax tablet and a stylus. And about as effective at lightening DP's workload.

Comshare has put $10 million and 18 years DSS experience into the extraordinary System W. And along with System W, we've also provided the software facilities you need to do a professional job of servicing your end-user needs.

For example:

With System W's integrated data management and File Power, you can set up data acquisition sequences including interfacing to corporate and external data in a variety of forms. File Power is the built-in response to the user's most often asked question, "How do I connect to the data?"

And with Distributed W, you have compatible micro DSS software with integrated telecommunication that sends files and models both ways asynchronously or synchronously. And System W operates on IBM mainframes with VM/CMS and MVS/TSO giving you flexibility as your operating system plans change.

Our Commander Learning Station gives end-users the latest in computer-based training on an IBM PC. Courses are available for System W as well as generic courses on how to model and use VM/CMS.

There's more. But System W is, simply, the best choice for decision support on IBM computers for excellent ease-of-use and integration. It's popular with end-users. Plus, it's easy to install, operate and interconnect with your DP architectures.

We started from scratch. System W is engineered to take full advantage of new technology. It's not an upgrade of an old product straining to keep up with the times. System W is as up-to-date as tomorrow.

For more information, call Chris Kelly at Comshare toll-free: 1-800-922-SYSW (in Michigan call: 313-994-4800). Or simply mail your business card to: Comshare, P.O. Box 1588, Ann Arbor, Michigan 48106.

SYSTEM W DECISION SUPPORT SOFTWARE

COMSHARE.

For decision makers who need to know their options now.

NETWORK

from page 1

ties. A backbone network of two AT&T T1 lines now connects the main facilities. Two channel banks are required to digitize voice so it can be transmitted at speeds of 32K bit/sec. over the lines, and front-end processors feed channel banks so that data can be sent over the T1 lines. Microwave facilities connect the nine regional offices to the two central facilities.

Private branch exchanges route traffic between principal McDonnell Douglas offices. The two main facilities and a third facility in Huntington Beach, Calif., are equipped with Northern Telecom, Inc. SL-100 PBXs. The other offices house Northern Telecom SL-1 switches. The PBXs are used for voice, dial-up, data and video transmissions.

McDonnell Douglas chose a combination of twisted-pair and fiber-optic media to link the PBXs and users at the various facilities. Twisted-pair wire connects employees to the network, and fiber-optic backbones are used in various buildings. Augustin noted that there is extra fiber bandwidth that can be used if the network has to be expanded.

> ”
>
> *'It takes two pages to list all the lines we had to cut over to.'*
>
> — D. C. Augustin
> McDonnell Douglas Corp.

The migration from Centrex to PBXs was divided into phases, with the first phase being the installation of smaller switches and microwave facilities at the remote offices.

Like most first-time installations, problems were expected, and they were encountered. "We had trouble getting easements for the microwave facilities," said James C. McAllister, director of telecommunications at McDonnell Douglas. "I don't know how some companies that plan on installing hundreds of earth stations will be able to manage installation." Microwave antennae have to be approved by local building commissions.

At the end of 1984, with the smaller switches up and running, the company began to install the SL-100 PBX, a relatively new switch from Northern Telecom. "The software was not very mature at the time we were installing the switches," Ridenhour noted. "That situation created some problems for us." Since the company was an early user of the switch, no one had tested the product enough to understand fully its functions and its limitations.

Ridenhour maintained that Northern Telecom has solved the problems. With initial bugs fixed, the first big switch was installed at the Huntington Beach facility in February 1985.

In June, the last switch was up and running at the facility here, which has 37,000 employees. "It takes two pages to list all the lines we had to cut over to," Augustin noted. "There are 27,000 trunks at our facility [here]. Switching them all at one time was nerve-racking." If the switch didn't work, no phones would ring at the aerospace and time-sharing company.

Adding to the problem was the software's wide degree of flexibility. "We should have decided which options we wanted when we first looked at the switch," Ridenhour added. "We were changing our requirements at each site."

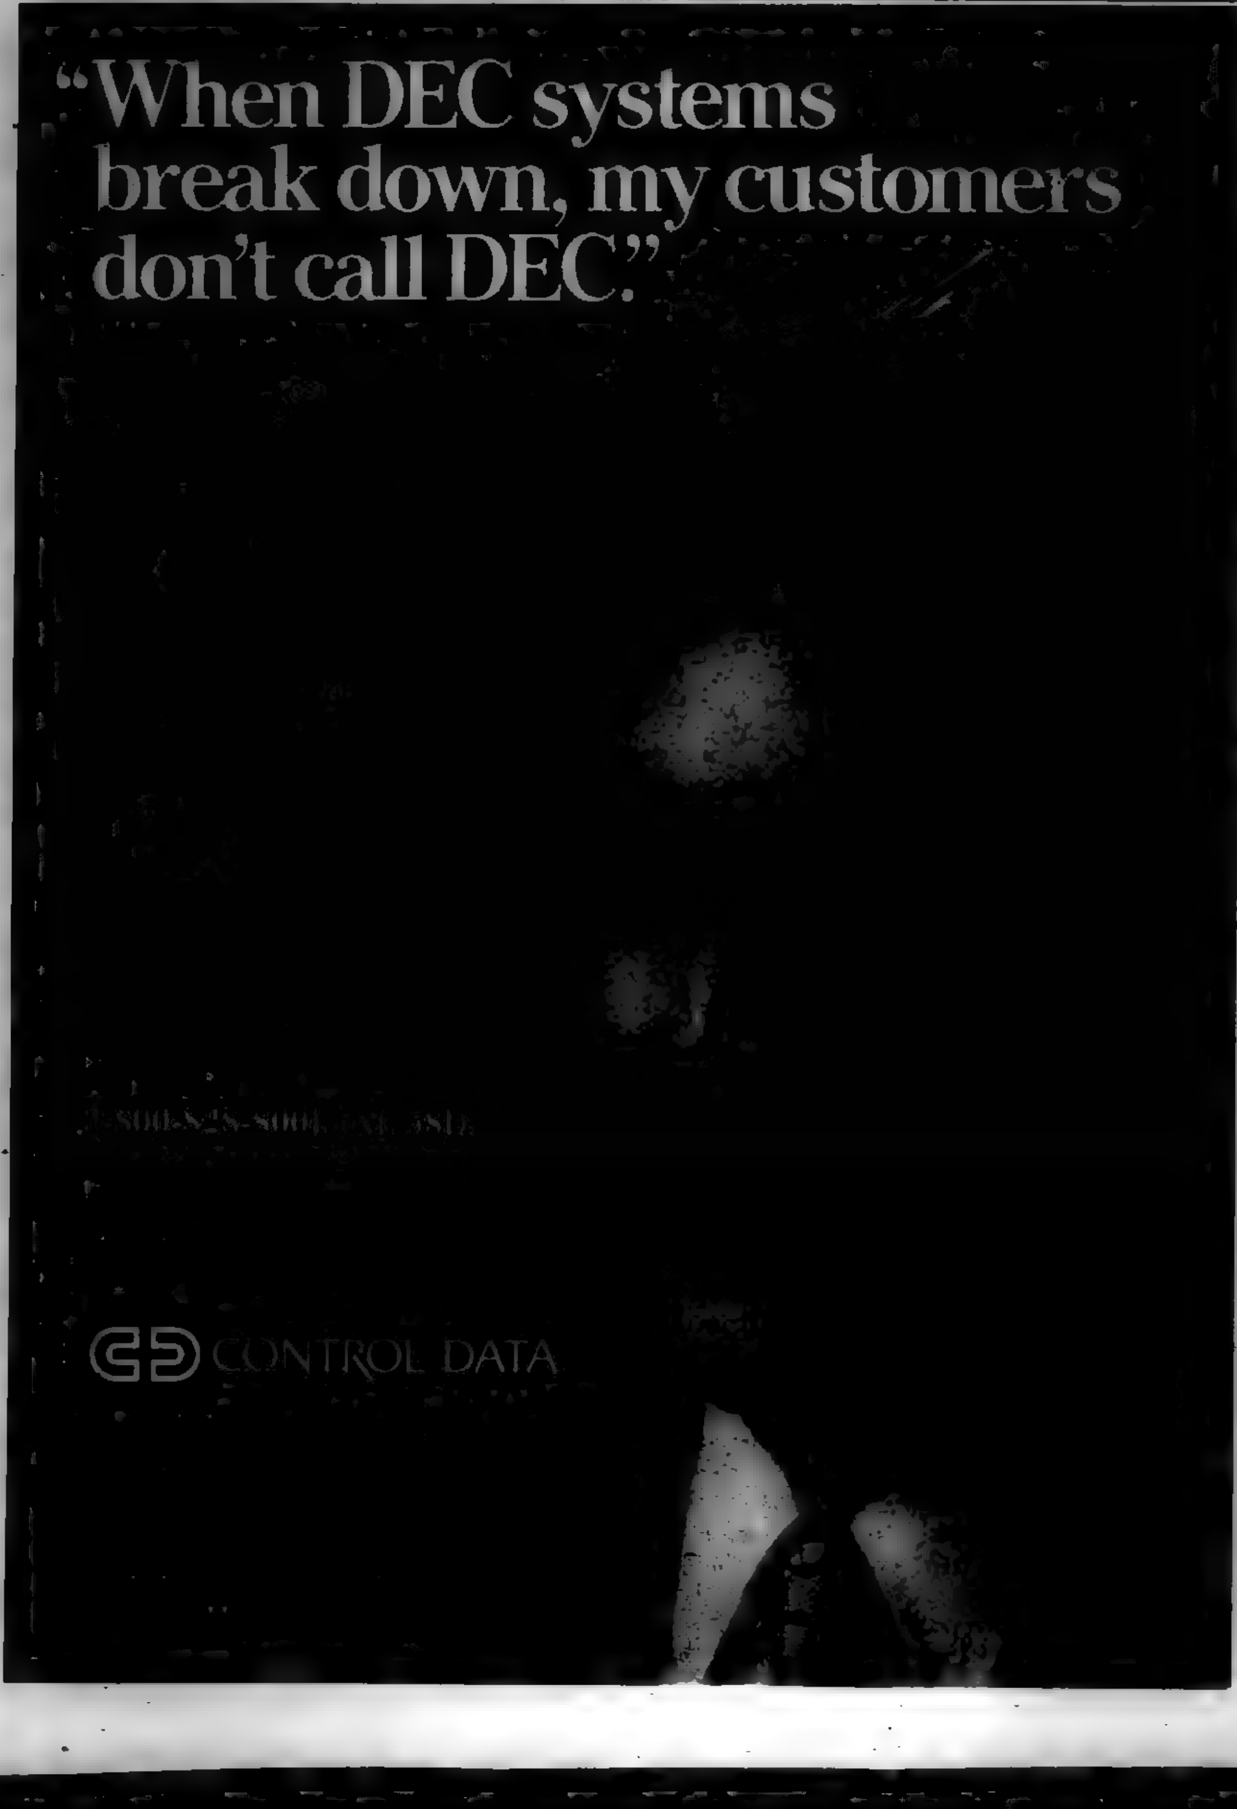
The problems were minor for such a large network, according to Ridenhour. He estimated that the network handles 400,000 transmissions each day. If McDonnell Douglas were a private telephone company, it would be considered the 22nd largest, according to the vice-president.

Thus far, Ridenhour has deemed the implementation successful.

Ridenhour considers training a key reason for the success. All employees were given classes on the system, and the company supplemented vendor training materials with its own offerings.

For two weeks, employees had two telephones on their desks: one for the old system and one for the new. "We wanted to make the transition as simple as possible," Ridenhour said.

Ridenhour estimated that the system would save the company $15 million a year.



"When DEC systems break down, my customers don't call DEC."

CONTROL DATA

User claims NCR sold faulty mini, seeks $1.1 million

By Clinton Wilder
CW Staff

PONTIAC, Ill. — A family-owned accounting firm here is seeking $1.1 million in damages from NCR Corp. for delivering and failing to service an allegedly bug-ridden minicomputer system nine years ago.

The owners of Pontiac Services, Inc., have failed in their two-year battle to have the case heard in court but will argue the case before a federal arbitrator in Chicago on Sept. 11. The Monical family claims its NCR 8200 Century minicomputer, purchased in 1976, failed to run properly, dumped stored data without warning and inaccurately printed textual material.

The Monical case is one of several multimillion-dollar legal actions against NCR stemming from allegedly defective mini systems that the Dayton, Ohio-based vendor sold in the late 1970s.

Successful lawsuits

Earlier this year, San Luis Obispo, Calif., businessman Alex Madonna won $5.8 million in damages in a lawsuit stemming from a defective Model 499, the largest amount ever awarded in a computer misrepresentation case [CW, June 3]. In 1982, NCR paid $2.6 million to an Oakland, Calif., dry cleaning firm that had bought what it claimed to be a bug-ridden 8200 Spirit in 1977 [CW, Nov. 1, 1982].

Pontiac Services originally sought $5.6 million in damages when it sued NCR for fraud in Livingston County, Ill., Circuit Court in 1983. But the court upheld NCR's claim that the case did not involve fraud, and therefore, must be resolved through arbitration, the procedure specified in NCR's general customer contract for settling misrepresentation disputes. The Monicals appealed that decision to the Illinois Supreme Court, but the higher court declined to hear the case, sending it back to arbitration.

Steven Monical, one of the plaintiffs, said an arbitrator can award only actual rather than punitive damages, so the amount sought was reduced to $1.1 million. He said an out-of-court financial settlement is still possible, but he said the amount currently being offered by NCR is "ridiculously low."

Alleged that machine became unusable

The Monicals claim that their $47,000 NCR 8200 minicomputer had problems from the beginning but that the system became virtually unusable in the second half of 1979.

"The machine would just halt, stop processing, and we would have to rerun the whole job," according to Monical. "The printer would insert extra spaces between characters and lines or skip lines altogether. The CRT unit would just go crazy, with characters dancing across the screen."

The plaintiffs also allege that NCR service personnel from the company's Peoria, Ill., office repeatedly failed to correct the minicomputer's problems, despite the $10,500 the Monicals paid in maintenance charges.

"They mostly pointed elsewhere, saying it wasn't a hardware problem but a problem with the power supply, or software or with different operators of the system," according to Monical. "They finally gave up sometime in 1980."

In their 1983 court complaint, the Monicals alleged that an NCR repairman admitted in 1980 that the company "did not have engineers capable of correcting the malfunction." They further charged that NCR did not test the minicomputer before its sale.

The corporate attorney representing NCR in the case could not be reached for comment before press time.

Wang buys switch maker

LOWELL, Mass. — Wang Laboratories, Inc. expanded its move into data communications last week by announcing an agreement to invest in a vendor of department-size digital voice/data switching systems.

Wang said it will acquire an initial minority stake in Los Gatos, Calif.-based Telenova, Inc. Wang added that it will increase the investment to 40% — which a spokesman said represents a value of $15 million — by March 1986 and has the option to increase it further to 51% by December 1986.

The transaction was similar to an agreement reached in April 1984 with Intecom, Inc., a vendor of large private branch exchange systems. Wang owns approximately 22% of Intecom.

In a prepared statement, An Wang, chairman and president of Wang, said the Telenova equipment can quickly be integrated with Wang systems. With agreements for both Intecom and Telenova switching equipment, Wang is "in a very strong position to most effectively integrate both computers and communications to provide total office automation solutions for all sizes of offices," he said.

Telenova is headed by Edmund J. Keane, its founder, chairman and chief executive officer, and has received prior financing through venture capital sources.

Net control tools help managers keep users happy

By Paul Korzeniowski
CW Staff

Charlie sits at his terminal and presses the Enter key on his IBM 3278 terminal.

From the terminal, the data journeys to an IBM 3274 controller that is connected to an AT&T Information Systems modem that passes it to an Ares Corp. bridge for a Nynex Corp. telephone line that hands it to an AT&T Communications long-haul facility that works with Rockwell International Corp. digital microwave equipment and transports the data to a Bell Atlantic Corp. telephone line that uses another bridge to send the data to the central site's T-Bar, Inc. matrix switch that feeds an IBM front-end processor that works with an IBM mainframe where information is processed and sent on a return trip, if all connections are working properly.

Often, a connection may not be functioning, creating problems for Charlie and for the manager who is responsible for making sure that Charlie remains a productive, happy user.

A number of companies are installing network management systems to keep users like Charlie happy. Network management systems vary, depending on what equipment they monitor for each connection and what information they provide. Some

MANAGE

from page 12

center on host-based software, and others work with intelligent modems. This report examines modem-based packages.

These systems consist of hardware; software, which usually includes a data base; and diagnostic devices residing at various points on a network. The packages' control capabilities can help prevent a line problem, correct one if it occurs and monitor a variety of equipment. A number of packages also supply reports that aid in examining how often a line may malfunction and that track the number of telephones, telephone lines and modems that a company may require.

Although network control packages have been available for more than 10 years, a random poll by *Computerworld* of communications managers at half a dozen large companies found that managers listed selection and installation of a network control package as their departments' most important objective.

"Now, our network control tools provide bits and pieces of the information we need," noted Sammy D. Taylor, director of telecommunications at National Gypsum Co. in Dallas. "We need a complete system that supplies information to end users, technicians and upper level managers so everyone understands how the network is functioning."

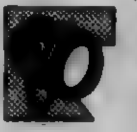
> *'We need a complete system that supplies information . . . so everyone understands how the network is functioning.'*
>
> **— Sammy D. Taylor**
> **National Gypsum Co.**

Two factors are fueling the interest in network management: the divestiture of AT&T and the increasing complexity and importance of corporate networks.

Before divestiture, AT&T provided one-stop shopping for telecommunications, shouldering end-to-end responsibility for voice/data services. Today, a number of vendors are responsible for pieces of connections used by employees like Charlie. If a manager calls one vendor to examine a problem, it will probably blame another vendor's equipment. "Since divestiture, there has been a lot of finger pointing and trouble coordinating problems with the [former Bell operating companies]", according to Al Watrid, manager of technical services at Cuna Mutual Insurance Co. in Madison, Wis. "It took operating companies almost 10 months to install one circuit for us in Southern California."

A number of vendors have attempted to provide the service that AT&T previously supplied. "Whenever a vendor manages a network, it will cost a company 30% to 40% more to run than if a company managed the network [itself]," noted Gerald P. Ryan, president of Connections Telecommunications, Inc., a Bridgewater, Mass., consulting firm.

Earlier this year, Cuna Mutual hired a vendor to manage its network but was not satisfied with the service it received. "We are now looking at buying our own network management package," Watrid said.



One consultant urged other companies to follow Cuna's lead. "I would recommend that companies divorce themselves from all telephone companies and vendors and take network control into their own hands if they have the staff and tools," suggested Gabriel Kasperek, president of Kazcom, Inc., a consulting firm in Park Ridge, Ill. A primary benefit of managing a network is that an in-house staff will fine-tune a network so it will run most effectively.

A second factor fueling the interest is that networks are becoming more complex and more important to many businesses. Often, businesses could function when a network was down because networks merely supplemented business operations. Today, a number of financial, airline and information businesses rely on networks so greatly that when a network goes down, a company cannot function until it is restored. For example, if a central switch at a stock brokerage house went down for 5 minutes, the loss could be catastrophic.

However, even in companies where a network does not pump a company's lifeblood, interest in network control is increasing. "Our networks are not as vital to our business as networks are to banks or insurance companies," National Gypsum's Taylor said. "I would rate their importance as a six on a scale of one to 10."

National Gypsum has seven networks used by separate divisions and their remote sites. Taylor has just begun the evaluation process for a network control package that could be used with the various networks and plans to have it installed by the end of the year.

When managers like Taylor examine these packages, they discover a range of prices of the number of lines they can monitor and of the type of tests they can perform. Some packages are based on hardware as simple as an intelligent terminal; others are as sophisticated as a Digital Equipment Corp. VAX supermini.

In most companies, a network control operator who is a member of the computer operations staff is responsible for the equipment. Sitting at a central terminal, the operator can monitor all network connections,

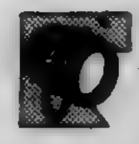
even those in remote locations.

This is possible because various points on a net are equipped with intelligent devices that monitor transmission paths. Paths vary in quality for two reasons: Noise or static can cause data to be lost or incorrectly transmitted; also, data terminal equipment can malfunction and block a path.



The intelligent devices monitor telephone line and equipment performance and then transmit this information through an unused portion of a line to the central network control station where the operator sits.

Vendor offerings use various portions of a line to transmit diagnostic data. Some send it over a frequency band that is outside the main data stream, hence the term "outband signaling;" other manufacturers intersperse control data within the data stream in a technique known as "inband signaling." Either technique enables network and diagnostic data to be sent simultaneously.

Because of signaling differences, network management systems require certain equipment. Typically, modem manufacturers have optimized their packages to work with their modems. "Most of the major products do not offer a great deal of flexibility to incorporate other vendor's equipment," Kazcom's Kasperek said.

> ”
>
> *'Whenever a vendor manages a network, it will cost a company 30% to 40% more to run than if a company managed the network [itself].'*
>
> — Gerald P. Ryan
> Connections Telecommunications, Inc.

Many vendors sell wraparound boxes to solve this problem. A wraparound box straddles a modem, monitoring both digital and analog sides. Whether generated by the modem itself or captured by wraparound devices, the diagnostic information gathered is then sent to a central monitoring point. There, some packages automatically evaluate the data; other packages work interactively with an operator.

Alarm notifications are an example of automatic processing. When a system is first installed, a communications manager can set desired quality parameters. If a line's noise level exceeds the parameters, the system will flag the problem, and bells will ring, alerting an operator. Other packages require that operators constantly monitor the data and determine when a problem is occurring.

Some packages sound an alarm before a line reaches the point where data has been damaged. In those cases, a terminal operator is then left with a series of options. He can perform loopback, bit error or other tests that help to pinpoint line problems. When it is located, he can either call a vendor that will fix the problem or, in certain situations, fix the line himself. With some systems, an operator can disconnect a modem, switch to a spare modem and reestablish the connection.

Not all packages sound an alarm before a line is down; some ring only when the line goes down. "Being able to switch a line before it goes down was a key reason for our selection of a package," noted Bill Wolf, assistant vice-president of telecommunications at Pittsburgh National Bank, which has been using a net control package from Racal-Milgo, Inc. since 1981.

Wolf claimed that the network management system, which cost the bank more than a $1 million, has helped the bank expand its branch services, add automated teller machines and monitor how its network is used.

"The system has more than paid for itself," he noted.

Enable 1.0...
"everything Symphony hoped to be."
PC Magazine

"Quite simply, this package has so many outstanding attributes that even the worst skeptics of integrated software have to be impressed. The spreadsheet is very close to 1-2-3; the word processor combines the best thinking of WordStar, MultiMate, Volkswriter, and EasyWriter; the data base offers the functionality of dBASE II, but with many of the ease-of-use features of PowerBase; and the program offers business graphics and telecommunication. Taken as a whole, Enable surpasses the functionality of Symphony, Framework, Aura and Open Access."
IBM PC Update
December, 1984

"... as powerful as a collection of stand-alone programs, and it offers the benefits of integration to boot. What's more, it runs in only 192K bytes of memory."
ComputerWorld
March 20, 1985

"Offering true integration among all of its applications modules... [Enable is] a powerful production tool that can serve everyone in the office, from data entry personnel to the vice-president of marketing. Each module could stand as a full-powered application in its own right."
PC Magazine
February 19, 1985

"Enable is one of those programs that can be up and running with most of the features you need in a few hours. As you need more, you can get deeper into the program and learn at your own pace."
InfoWorld
January 21, 1985

Enable first in "Performance" rating—including speed and capacity of all modules tested. Enable first in "Versatility" rating—including power and functionality of all modules tested. Enable rated first in overall evaluation of the word processor module.
Software Digest Ratings Newsletter
Rating of 15 Integrated Products
December, 1984

"Enable, a five-function integrated system from The Software Group, merits a close look by any individual or organization interested in a solid package that is well balanced in all of its applications."
Popular Computing
March, 1985, Paul Goldner, Raymond Hood, Yoram Lirtzman, Michael Wilding

"... if an office is looking to step up to across-the-board integration with a multitude of functions... this is the one program to seriously consider."
Personal Computing
March, 1985

"Enable welds its five applications together with outstanding integrity—yet each is exceptionally full-functioned in its own right."
Business Computer Systems
January, 1985

"Enable... may be the first program to make you give up your dog-eared WordStar, dBASE II, Smartcom and Lotus 1-2-3 disks."
Business Software
April, 1985

"Enable may legitimately claim to be the only package you'll ever need."

Lack of features weaken net management packages

By Paul Korzeniowski
CW Staff

Keeping a line up and running is one problem; determining how the line is being used is a second concern. To manage a network properly, companies need to know what information is being transmitted, how long system response time is and where line problems are occurring. Most network management systems adequately keep lines up and running, but few supply the tools to manage a net.

One management tool is trouble ticketing. Whenever alarms are sounded, a system can produce tickets that state the time a problem occurred, the time it was fixed and the line or equipment that was experiencing the problem. This and other information is then stored in a data base from which reports concerning items such as the network's average response time and line quality can be ascertained. With the reports, managers can pinpoint recurring problems, determine how a network is being used and plot the future growth of the net.

Also, a company can track its telephone lines, modems and other communications equipment with inventory reporting capabilities incorporated in most packages.

Despite the benefits, few companies have purchased these packages because they are rather limited. "The vendors have been slow to offer the features that users desire," noted Mark Larow, a consultant with Network Strategies, Inc., a Burke, Va., consulting firm.

A chief complaint concerns the systems' management reporting capabilities. "In most cases, the management reports only monitor connections on a network, they do not include information about how the network is being used," noted Gerald P. Ryan, president of Connections Telecommunications, Inc., a Bridgewater, Mass., consulting firm. "These packages could easily be designed to include information concerning what data is going where over a line, but companies seem unwilling to take this step."

Lack of ease of use is another shortcoming. Many packages require that an operator fully understand how a network operates. "The packages are only as good as the person analyzing the data," noted Steven H. Booth, president of Communication Consulting Associates, Inc. in Framingham, Mass. "In some cases, the person may not have a great deal of technical experience and may supply an inaccurate view of how the network is functioning."

Some vendors are attempting to overcome these limitations. A number of packages are incorporating simpler operator interfaces and color monitors that graphically depict network operations. Other packages are making analysis more menu or command driven.

But even for a large corporation, these packages are expensive and difficult to cost justify.

Ryan stated that current offerings represent a first step toward the products that companies require. "Better tools will become available as users put more pressure on vendors," he concluded.

Staff key to net gain

Once a company has found the right network management package, it has to locate the proper people to run it — a process that can be more time consuming and frustrating than picking a vendor.

"Finding knowledgeable people to run a network can be a problem," noted Sammy D. Taylor, director of telecommunications at National Gypsum Co. in Dallas.

The company currently has two people working in network management, and Taylor predicted that the staff will at least triple in size when a new package is selected and installed by the end of the year.

Taylor's estimated growth may be conservative if one examines changes made at Pittsburgh National Bank since it installed a system in 1981. Its staff has grown from three to 20 network management operators, according to Bill Wolf, assistant vice-president for telecommunications.

Where can a company find skilled network operators? Another company's personnel represents a principal source. However, robbing other companies of their net management employees can inflate salaries and create ill feelings.

Companies like National Gypsum plan to take their own employees and train them to become network managers. "I don't think we really have any other choice," Taylor stated.

Enable 1.1...
now 15 ways better.

When we introduced Enable in late '84, we made two promises:

1. Enable would be the industry's first truly full function, totally integrated system.
2. We would continue to enhance Enable with new features and functions to always give you the best value in microsoftware.

The reviews on the left demonstrate our success with promise number 1.

The new features highlighted below do the same for promise number 2.

And this is merely the beginning. No matter what direction future micro technology takes, Enable, with its open architecture, will continue to advance right along with it. And with you. To ensure this, we've established an end user advisory board to tell us what you want. And we *do* listen.

Now for the new.

System-wide Features

- Data transfer facility—beyond "cut and paste"—lets you transfer specific data from one module to another, linking files across all applications. For example: a field in a DBMS record can contain the name of a spreadsheet, a word processing document or selected records from another database. When viewing that record, Enable will automatically display the other "linked" file.
- User-designed menu generation—tailor Enable to your specific needs with your own unique menus, help and error messages, pop-up windows, and full choice of colors.
- Window to DOS—execute DOS functions without leaving Enable.

Word Processing

- Automatic indexing and tables of contents.
- Multiple column copy and move.
- MultiMate compatibility. (We already gave you WordStar, EasyWriter and Volkswriter.)

Spreadsheet

- User configurable—choose among 6 varied shapes from 255 rows × 255 columns to 4095 rows × 15 columns.
- 1-2-3 macro support—automatically convert your existing Lotus macros or create your own Enable spreadsheet macros with all the same macro commands you used in 1-2-3.
- Greatly increased Lotus file conversion (twenty times faster!).

DBMS

- Comprehensive file maintenance capabilities—verify, copy, update and merge functions.
- Powerful command language—commands for writing routines, reading and updating files, generating printed reports. (All the power of dBASE III without the complexity.)
- Expanded record size—up to 254 real, virtual and computed fields.
- Direct conversion of Lotus spreadsheet data into Enable database format. (Now you can use Enable's full-function DBMS instead of the limited database functions of the Lotus spreadsheet.)

Telecommunications

- Terminal emulation (VT-100 and other popular models).

Graphics

- Increased printer and plotter support (twice as many leading models).

And now for the *really* good news. All this functionality can be at your fingertips on the standard 256K IBM PC, up through the PC/AT (and true compatibles). All for $695.

You can, at last, get out of the quagmire of trying to solve your multi-purpose needs with single purpose software.

Your training and support costs will drop, data sharing will rise. Dramatically.

You can even protect your investment in Lotus 1-2-3, MultiMate, WordStar and dBASE II because Enable is fully compatible with those and other single purpose programs.

And, since trying is believing, we'll send you a demo system for a token $12.95.

If your dealer doesn't carry Enable (and you should raise Cain if he doesn't), give us a call and we'll put you in touch with one who does.

Just dial 1-800-932-0233. In New York, dial 1-800-338-4646.

Tektronix unwraps AI workstations, Lisp version

Lowers price tag on 4404 AI system

By Donna Raimondi
CW Staff

BEAVERTON, Ore. — A pair of artificial intelligence workstations, powered by the Motorola, Inc. 68020 processor, were released by Tektronix, Inc.'s Information Display Group. At the same time, the company introduced a version of the Lisp programming language and dropped the price of its year-old 4404 AI system.

The workstations are targeted at AI development, applied AI and advanced software engineering, the company said.

All members of the 4400 family reportedly feature Xerox Corp.'s Smalltalk-80 operating system and a C compiler.

Outgrowth of AI research

The 4405 and 4406 AI workstations join Tektronix's 4404 AI system, the vendor said. The products are said to be an outgrowth of Tektronix Laboratories' AI research efforts begun in 1982 to study knowledge engineering, expert systems, design support environments, AI languages and environments, algorithmic techniques and symbolic computation.

The top-of-the-line 4406 includes a 19-in. display with a resolution of 1,280 by 1,024 pixels; 2M bytes of dynamic random-access memory (RAM), expandable to 4M bytes; a 32M-byte virtual memory address space; and a 90M-byte hard disk with a 5¼-in. floppy drive, according to Tektronix.

The use of the 68020 chip, combined with a Motorola 68881 floating-point coprocessor and extended memory capacity, is said to give the 4405 100% higher performance than last year's model.

The 4405 reportedly offers 32M bytes of virtual memory address space and 1M byte of dynamic RAM, expandable to 5M bytes. This compares with the 4404's 8M bytes of virtual memory and RAM expansion of 4M bytes.

The 4405 includes a 13-in. screen with a 640- by 480-pixel viewable display.

The system comes with a 45M-byte hard disk drive and a 5¼-in. floppy drive and has either a three-button mouse or a joystick, according to the vendor.

Implementation of standard Lisp

The Tek Common Lisp language, developed in conjunction with Alameda, Calif.-based Franz Lisp, Inc., is said to be a full implementation of the standard Lisp as documented in Guy Steele's *Common Lisp, The Language*.

The language has been optimized for performance on the 4400 family, Tektronix said.

A license for the Tek Common Lisp costs $6,000 and includes a year of upgrades and maintenance, the vendor said.

Tektronix slashed the price of the 4404 from $14,950 to $11,950. The 4405 model costs $14,950, and the 4406 costs $25,950.

Users of the 4404 may upgrade to the 4405 via the 4404F05 Field Kit, which costs $3,500 and retrofits the 4404 with the 68020 CPU and the 68881 floating-point coprocessor, Tektronix said.

The newly announced products are scheduled for delivery in January 1986.

More information can be obtained from Tektronix through P.O. Box 500, Beaverton, Ore. 97077.

Chemical firm finds solution in micro-mainframe bond

By Maura McEnaney
CW Staff

WOODCLIFF LAKE, N.J. — William Heany may protest that he is only an end user of computer systems, but this obscures the fact that it was his suggestion that paved the way for use of micro-mainframe links at Witco Chemical Corp., a $1 billion chemical and petroleum products company. Heany's proposal of a terminal emulation product resulted in dramatic corporate savings and improved operational efficiencies for his company.

> 'We felt we didn't have any computing power on a dumb terminal.'
>
> — William Heany
> Witco Chemical Corp.

Heany is manager of Witco's distribution and traffic systems division, which, among other things, keeps track of the 1,200-car rail fleet that transports the company's oil and chemical products across the U.S. Daily reports on car location and cargo status are batched processed by the company's IBM 3083 mainframe, running IBM's OS/MVS operating system, and distributed to 10 Witco locations throughout the country.

In early 1984, Witco converted from leased terminal controllers and printers to personal computers and PCpath, Pathway Design, Inc.'s micro-mainframe product. The results were first-year savings of more than $30,000, according to Anthony Falato, Witco's manager of systems development.

Now, once traffic reports are batched processed on the mainframe, Witco's remote users can log on to the corporate mainframe via micros running PCpath, which is an IBM 3270 terminal emulation package. This package then allows them to extract reports from the mainframe's data.

Prior to obtaining IBM Personal Computer XTs and PCpath, Witco's 10 field locations leased IBM's 3276 terminal controllers and IBM 3276 printers at the cost of about $6,000 per month.

"They were nothing more than dumb terminals, and there were other computing functions that we wanted in our remote locations," Heany said. "In addition to maintaining a connection to the host at Woodcliff Lake via [Systems Network Architecture] protocols, we recognized the need to channel communications to other areas. We felt we didn't have any computing power on a dumb terminal," he said.

Witco rejected an IBM representative's recommendation of downloading information onto the IBM Personal Computer XT hard disk and spooling that data onto its Epson America, Inc. FX-100 printers. Instead, the company opted to be an early user of PCpath, used in conjunction with XTs.

Heany said that the company selected PCpath because of its ability to hook up with Witco's existing printers. Heany and others talked with early users of PCpath, and although they were using different applications, there were enough similarities to give the product a green light.

At Witco, PCpath is used to maintain a communications link with the corporate mainframe and allows the FX-100 printer to appear as an IBM 3287 printer. The IBM Personal Computers can be used with asynchronous communications boards and modems to communicate externally with time-sharing information systems, Heany said.

To expedite training on the Personal Computers, Witco sent the remote users PCpath cardboard templates that indicated key definitions for the 3270 terminal and allowed users to teach themselves how to use the emulation packages, Heany explained. Consequently, Heany said, remote users were able to use the Personal Computers to extract needed reports within three months of installation.

Early-user status did not cause Witco to shy away from selecting the product, Heany said, because PCpath provided capabilities that the company needed. And now, after a year's experience with the product, Witco is planning to upgrade to Version 2 of PCpath. The new product, when available, will permit users to conduct up to five concurrent sessions on the mainframe.

The company also uses PCpath for local terminal emulation at its research and development group in Houston. According to Heany, implementation of a micro-mainframe link meant teaching users about mainframe access and personal computer operation at the same time. "The [personal computer] ball game here at Witco is so new that we're going through some growing pains," he said.

Michelangelo 1508-12

POPLOG.

Where Artificial Intelligence Solves Real-World Problems.

Now you can dramatically reduce costs and create expert or knowledge-engineered systems more quickly and easily with POPLOG.

An integrated combination of languages, POPLOG is a fully-supported interactive AI development environment that runs on VAX(VMS), VAX-(UNIX), SUN II workstations and HP 9800/200 computers. Because it allows the most appropriate language to be used in a given situation (PROLOG, LISP AND POP-11), it provides incremental compilation facilities to promote fast prototyping. Routines can be written in PASCAL, C, FORTRAN, and ADA all of which can be linked into the POPLOG environment.

POPLOG contains an on-line support system and a powerful screen editor to provide a set of AI-based tools. Once you see how much power you can obtain for a fraction of the cost of other more complicated, hard-to-use systems, you'll want POPLOG.

For more details and our exclusive NO-RISK evaluation, call or write today. POPLOG is the artificial intelligence tool that solves real-world problems.

WASHINGTON UPDATE
CW Washington Bureau

IRS plans pilot program for electronic tax filing

WASHINGTON, D.C. — The Internal Revenue Service recently announced plans to conduct a pilot program in 1986 permitting commercial tax-return preparers to send returns electronically to the IRS, a move that may cut processing time at the IRS by two to three weeks.

The IRS said it wants to take advantage of the fact that a growing number of tax preparation firms use computers to prepare individual income tax returns.

The IRS said the pilot will be limited to refund returns prepared for taxpayers in Phoenix, Cincinnati and the metropolitan area around Raleigh, Durham and Fayetteville, N.C.

Firms interested in participating should contact the Electronic Filing Project Office, IRS, 1111 Constitution Ave. N.W., Washington, D.C. 20224.

Bill curbing computer sales to South Africa advances

WASHINGTON, D.C. — A compromise version of the Anti-Apartheid Act of 1985, which would curb sales of computers to the Republic of South Africa, was recently approved by the U.S. House of Representatives and awaits a U.S. Senate vote in September.

Before leaving for the August recess, House and Senate negotiators approved a compromise bill that prohibits future sales of computers to apartheid-enforcing agencies in South Africa's government.

The compromise bill closely follows the Senate version of the legislation, which was supported by the U.S. computer industry [CW, June 17].

The Computer and Business Equipment Manufacturers Association opposed the House version, which banned computer sales to all South African government organizations.

The Senate, which was unable to vote on the bill due to objections raised by Sen. Jesse Helms (R-N.C.), will resume debate on Sept. 9.

FEC to sell computer access to campaign finance records

WASHINGTON, D.C. — The Federal Election Commission (FEC) recently announced plans to start a subscription service in September that will provide direct on-line computer access to FEC campaign finance records for the news media and other members of the public.

The agency said it plans to provide information for the 1984 and 1986 presidential and congressional election campaigns in two formats. The first format would enable microcomputer users to obtain raw data for storage on floppy or hard disks.

The second format would provide summary tables on candidate finances to remote terminals, like the pilot program now under way with several state election offices [CW, Sept. 16].

GSA offers U.S. agencies programmer's workbench

WASHINGTON, D.C. — The General Services Administration (GSA) recently opened a center for demonstrating to government DP managers how commercially available software tools and processes can improve information management at U.S. agencies.

The center, recently unveiled at GSA's Office of Software Development and Information Technology in Falls Church, Va., features a programmer's workbench that has a family of automated workstation systems for software development, maintenance, conversion and project management tasks.

The center also provides demonstrations of microcomputer-based text search-and-retrieval systems and data base management systems, GSA said.

More information can be obtained from the GSA Office of Software Development and Information Technology, Suite 1100, Two Skyline Place, 5203 Leesburg Pike, Falls Church, Va. 22041.

Computer art contest slated

MELBOURNE, Australia — A worldwide computer art competition is being held in association with the First Pan Pacific Computer Conference (PPCC-1) here Sept. 10-13. CW Communications, Inc. — publisher of *Computerworld* and 53 other computer publications in 24 countries — is sponsoring the contest.

Entries must be produced by computer and should be suitable for display, a conference spokesman said. There are no limitations on the size of the artwork.

Each entry should be accompanied by a description of how it was produced.

Entries must be submitted in time to reach the PPCC-1 organizing committee by Aug. 23.

Entries will be judged in one of two categories: individual or organization. The prize for the individual contest is $1,000, and the prize for the winning company entry is a trophy.

Each individual or company is limited to a maximum of three entries, the spokesman said.

Entries will be displayed and the winners announced during the conference.

Entries and information requests should be sent to First Pan Pacific Computer Art Competition, P.O. Box 212, 11 The Avenue, Hampton, Vic., Australia 3188.

UNIVERSITY OF PETROLEUM & MINERALS
DHAHRAN - SAUDI ARABIA

The College of Industrial Management will have faculty positions (all ranks) open for the academic year 1986-87, starting 1 September 1986 in:

BUSINESS DATA PROCESSING MANAGEMENT

ACADEMIC QUALIFICATIONS AND EXPERIENCE:

Minimum requirements include a Master's degree in a relevant field, teaching and/or industrial experience, and/or CDP certificate.

The College of Industrial Management is a young, growing college, offering curricula equivalent to the standards of the AACSB. Research is encouraged and high-quality proposals are awarded university research grants.

Computer facilities available: IBM 3033 and AMDAHL 5850.

LANGUAGE OF INSTRUCTION IS ENGLISH.

Minimum regular contract for two years, renewable. Competitive salaries and allowances. Air-conditioned and furnished housing provided. Free air transportation to and from Dhahran each year. Attractive educational assistance grants for school-age dependent children. All earned income without Saudi taxes. Ten months duty each year with two months vacation with salary. There is also possibility of selection for the University's on-going summer program with good additional compensation.

Apply before December 31, 1985, with complete resume on academic, professional and personal data, list of references, list of publications, research details, and with photo-copies of degrees and/or transcripts, including home and office addresses and telephone numbers to:

UNIVERSITY OF PETROLEUM & MINERALS
HOUSTON OFFICE, DEPT. 340
5718 WESTHEIMER, SUITE 1550
HOUSTON, TEXAS 77057 USA

"We're saving $50,000 a year by eliminating SYSOUT printouts and installing JCLWTR."

That's the word from one user of AID's new JCLWTR system.

Instead of printing every production SYSOUT listing, JCLWTR stores them on disk where they're instantly accessible through special SPF screens or hard copy printouts.

The savings in paper, printing, handling, and storage costs add up so quickly that even medium and small shops can recover the system's minimal cost in just months.

JCLWTR installs on medium and large IBM systems operating under MVS and supports on-line interfaces to COM.

Find out how much you can save with AID's JCLWTR system. Send in the coupon, or call Terry O'Neill at 312/654-3030.

AID Applied Information Development, Inc.
823 Commerce Drive,
Oak Brook, Illinois 60521

Army system combats backlog

By Donna Raimondi
CW Staff

WASHINGTON, D.C. — An automated system for processing congressional inquiries to the U.S. Army has slashed response time from an average of 77 days to 22 days. The system allows the Army's Congressional Inquiry Division to handle 40,000 written and 20,000 telephone inquiries per year with the same size staff that processed a total of 6,000 inquiries a year five years ago, according to Col. Michael J. Connor, chief of the inquiry division.

Connor's division receives mail from congressional offices, routes the requests for information to the proper Army field agency anywhere in the world, gathers the needed information and responds to the congressional office where the inquiry originated, Connor said. Until late in 1984, the job was done manually.

The inquiries are given a high priority by the Army, whose goal is to have them answered within 30 days, Connor said. The number of inquiries multiplied rapidly in the last five years to the point where the target turnaround time could rarely be achieved, Connor said.

Under the manual system, mail was opened, sorted, date stamped, given a control number, microfilmed to ensure against loss and then routed to an action officer, Connor said. The action officer wrote an acknowledgment letter to the inquiring congressional office, decided where to get information and sent the inquiry along. After receiving a response, the officer put the information in the proper format and sent the handwritten result to a central word processing office for typing. After proofing, the final result was sent to the appropriate congressional office.

Handling 6,000 inquiries a year, the manual system was slow, with a 40-day turnaround time, but worked fairly effectively, Connor said. By August 1984, with a more than eightfold increase in inquiries, the system had slowed to the point where the average response time was 77 days, Connor said.

Connor looked closely at the steps involved in manually processing inquiries and discovered that 17 of the 57 separate procedures could be eliminated before automating, he said.

Also, the manual system used three work centers — the inquiry control center, where correspondence was logged in and tracked; the action officer center that worked the case; and the word processing center where final drafts were typed. With the new system, the action officer has the power to do all the functions previously performed in the three work centers, Connor said.

The Army's system comprises 65 Recognition Equipment, Inc. Inforex 9000 terminals in a local-area network, connected by 9.6K bit/sec. Gandalf Co. modems to 21 Inforex 9500 processors and three Inforex 9800 main file processors. A 400M-byte hard disk and two 200M-byte hard disks plus a tape backup system complete the setup.

Now, an incoming inquiry is date stamped and handed over to the officer, he said. The officer enters data in 21 fields, including the requesting constituent's name, the congressional inquirer's name, the field agency code, special remarks that will help the researching agency and the receipt date.

When the action officer writes the record, the system automatically generates an acknowledgment letter to the congressional inquirer, giving the constituent's name and the case's code number, Connor said. It also generates a "tasker" — the cover sheet that goes to the investigating agency. The tasker includes all the information the agency needs to work on the case, including general data such as the division's facsimile machine number and tips on how to respond to an inquiry.

The data base is searched for all prior cases in the constituent's name in recent years to earmark duplicate requests, Connor said. This cross-checking system eliminates duplicate searches by allowing the action officer to check the microfilm to see if the request has already been answered.

A word processing document shell is also generated automatically when the record is written, Connor said. It includes a return address, the salutation and the first paragraph. When the answer comes back, the action officer has only to add the remaining paragraphs, he said.

The division has added facsimile capabilities so that large volumes of correspondence can be transmitted without going through the mails, Connor said. Whether sent by facsimile, mailed or phoned in, all inquiries are read, acknowledged and sent to the proper agency for reply within eight hours of receipt, he said.

An Open Case Report gives the status of every unfinished case. Versions of the report are generated for each action officer, each congressional inquirer and each field agency so that everyone involved in the system knows where they stand and can spot any problems left unresolved.

Officer advises, get input on OA systems

WASHINGTON, D.C. — Management must be heavily involved in the development of office automation systems, said Col. Michael J. Connor, chief of the U.S. Army's Congressional Inquiry Division.

When Connor decided to automate a manual system used to answer congressional inquiries to the Army, he questioned each of the division's staff members about what they liked and did not like in their jobs.

"Based on those [staff] responses, it became very apparent to me that we had reached the point where we were literally going under. . . . The [staff] knew that the [manual] system was not responsive in the way that we wanted it to be.

"Managers have got to know what their organization has to do and where the payoff is," he said. After identifying the critical success factors for his organization, he was able to communicate what he needed to the contractor, Recognition Equipment, Inc.'s subsidiary, Inforex, Inc.

The first step in the project was to manually simplify the manual system, Connor said. "Unless a manager does that up front . . . automation is probably not going to solve any of his problems," he said.

After finding out what did and did not work well, Connor and his staff designed screens and user interfaces that would be easy for the staff to use.

Lawmakers seek to widen scope of wiretap statute

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — It is not illegal to wiretap or intercept interstate data communications or electronic mail messages, because the 1968 federal wiretap statute protects only aural, not digital, communications.

To fill this gap in federal law — which makes modern business communications vulnerable to government and industrial spying as well as to mischievous hackers — members of Congress are drafting legislation to protect the privacy of data communications and electronic mail, according to congressional and industry sources.

U.S. Sen. Patrick J. Leahy (D-Vt.) and Rep. Robert W. Kastenmeier (D-Wis.) will cosponsor the bill and introduce it in September, sources said.

Even before drafting of the bill has finished, the legislative initiative has garnered broad support from a wide range of groups, from the American Civil Liberties Union to the Computer and Business Equipment Manufacturers Association (Cbema).

"A broad consensus has developed that the word 'aural' should be stricken from the statute so that all forms of communication are treated the same," observed Oliver Smoot, executive vice-president of Cbema.

This year, Leahy and Kastenmeier are expected to produce legislation that not only strikes the word "aural" from the wiretap law, but also provides privacy protection for electronic mail and cellular phones, a congressional source said.

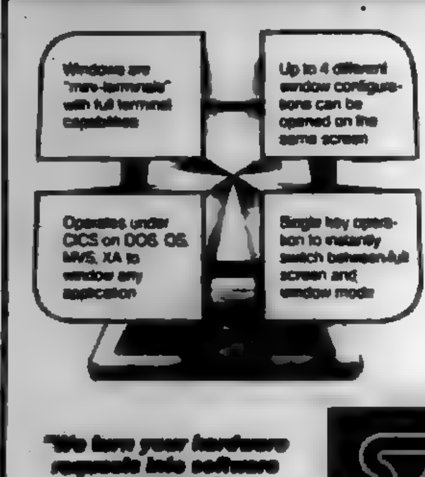
Michael F. Cavanagh , executive director of the Electronic Mail Association here and a key supporter of the Leahy-Kastenmeier initiative, said the legislation will address several significant concerns:

- It will discourage hackers, industrial spies and embezzlers from gaining unauthorized access to digital networks.
- It will prevent government, law enforcement and security agencies from intercepting or obtaining electronic messages unless they get a court order.
- It will prohibit systems operators from disclosing messages transmitted on their networks, much like telephone company operators are prohibited from disclosing conversations.

Even more important than this legislation, Cavanagh said, is the need for a federal statute that outlaws unauthorized access to private sector computers, since the network's host computer may be more vulnerable than the communications net.

Cavanagh said the Leahy-Kastenmeier bill would complement the computer crime legislation pending in the House Subcommittee on Crime, chaired by Rep. William J. Hughes (D-N.J.). The subcommittee is working on a bill that would expand the scope of the Computer Fraud and Abuse Act of 1984 to cover private computers used in interstate commerce [CW, June 3].

WINDOWS ON YOUR
MAINFRAME TERMINAL
CICS—WINDOWS



Windows are "mini-terminals" with full terminal capabilities
Up to 4 different window configurations can be opened on the same screen
Operates under CICS on DOS, OS, MVS, XA to window any application
Single key operation to instantly switch between full screen and window mode

SAVE YOUR
HARDWARE $$$

- Window facilities on every 327X terminal without any changes to your hardware or software
- Work with 2, 3, even 4 transactions simultaneously without losing valuable time switching back and forth between applications
- Increase productivity by having needed information instantly available on the same screen, including: other applications, menus, help screens, prior transactions, editors, notepads, etc.

INQUIRE®/Text:

Helps you find what's buried in your database.

No matter what new worlds you're trying to discover, you'll get there more easily if your software includes text management as well as the ability to combine numeric and textual data. Because as often as not, the information you need consists not of numbers, but of a few key phrases buried inside a mountain of written documents.

Until recently, accessing this information was a nightmarish task, largely dependent on paper filing systems and relatively fallible human memory.

But with INQUIRE/Text, the solution is easy. Powerful search commands zip through everything from research reports to correspondence—extracting vital information faster and more accurately than ever before.

The result is a major discovery for most users—and a significant breakthrough in decision support. For the first time, textual information can be retrieved and manipulated as easily as numeric data, then output into up-to-date, integrated management reports.

No wonder INQUIRE/Text users include people on the frontiers of scientific exploration—not to mention lawyers, records managers, engineers, and librarians.

And no wonder more and more organizations are seeing text management as an indispensable element in information systems design, especially considering IBM's directions regarding DISOSS and PROFS.

INQUIRE/Text. It'll broaden your horizons. And just possibly help you conquer a new world.

For more information call or write Infodata Systems Inc., 5205 Leesburg Pike, Falls Church, Virginia 22041. (800) 336-4939. In Virginia and Canada call (703) 578-3430. Telex 899125.

DBMS opens door to new revenue focus of realty group

System handles member services

CHICAGO — When a national real estate trade association here moved to derive less of its revenue from dues and more from services, it focused on data base management as a critical part in providing efficient service.

During a market slump between 1980 and 1981, the National Association of Realtors (NAR) began to realize it could no longer raise dues to maintain member services. Instead, it would charge for special services — on-line real estate listings and video-based training courses, for example — that it provided to specific groups of realtors.

"We realized that information was the most important resource we have and began our commitment to switching from a dues-oriented to a marketing-oriented organization," said Vincent Amato, NAR's vice-president of computer services. At that time, 90% of the association's revenue came from dues, and 10% came from services. This year, NAR said it expects the split to be 55% from dues and 45% from services, a division Amato said should stay relatively stable in the future.

More efficient processing

The change in focus carried with it a need for more efficient information processing. Using an 8M-byte IBM 4341, the association had kept Vsam files of administrative data — name, address and such information — about its 680,000 members. It maintained separate files for different groups to which those members belonged.

If a realtor was both a member of NAR and an officer on one of the association's committees, his name and other data resided in two different files. If the realtor subscribed to a service, the association set up yet another file that contained the same basic information.

As NAR searched for new DP systems, solving this problem ranked as a top priority. "One of our greatest concerns was that the systems maintain accurate, nonredundant information," Amato said. The association also wanted to find a system that would keep financial information in order.

After a six-month software evaluation, NAR purchased the IDMS/R DBMS, Integrated Data Dictionary, Application Development System/On-Line (ADS/On-Line) and related financial modules from Cullinet Software, Inc.

The association's DP department first used the development tool and data dictionary to set up a data base prototype, then began bringing up applications. Charles Koepke, NAR's MIS manager, explained: "We knew that when we designed the systems we would have to do a lot of up-front thinking and a lot of analysis, and the data dictionary would be the driving force behind that. We were convinced that the initial planning and analysis would help us get the job done faster and get it done right."

Within five months, two staff members implemented a general ledger model, and the association has used this implementation as an example to guide other development projects. Working with ADS/On-Line, programmers have since brought up a number of stand-alone applications, including programs to track political action committee money, realty convention registration and NAR committee membership.

Since it began using the development tool, the association has cut its DP expenditures by about 25%. In addition, Amato said, NAR has cut its DP staff from 55 workers to 42 through attrition, and the smaller staff maintains almost three times the applications load of the larger one. He said some of the productivity gains have come from using Cullinet's packaged financial applications rather than having the staff develop its own.

TO INSURE THAT EVERYONE CAN ACCESS DATA, TRANSAMERICA USES INTELLECT AT EVERY LEVEL OF THE PYRAMID.

"We use INTELLECT because we want to give our users a better way to do business."
—Mr. Carl Rahmqvist, Senior Systems Manager, Information Systems, Transamerica Insurance Group

Transamerica Insurance Group is recognized for the pyramid-shaped building of its parent, Transamerica Corporation, and for being one of the country's leading commercial and personal insurance companies. In some quarters, Transamerica is also recognized for its variety of innovative INTELLECT applications.

At Transamerica they see INTELLECT as more than a state-of-the-art natural language information retrieval system. They see it as a new way to do business: Giving all their end users—even those with no computer skills—instant access to more information than they'd ever had before.

"When they saw how easy, fast, and resource-effective it was to use, INTELLECT became a very popular tool."
—Ms. Sandra Dahlgren, Information Center System Supervisor

One Vice President uses INTELLECT to get the most current information on premiums and losses, and for longer term strategic planning with requests such as, "Give me the total June premiums and losses for each region." Regional offices use INTELLECT for a variety of tasks including asking INTELLECT to: "Tell me all about policy number 98579897." Personnel keeps track of employee records, EEO compliance, human resource utilization, and more, by questioning INTELLECT in plain English. Payroll, Claims, Underwriting, and Services also use a variety of INTELLECT applications. So from the top of the pyramid right down to the mailroom, Transamerica is using INTELLECT to work faster and smarter.

"After just minimal training, people began using INTELLECT frequently and effectively."
—Mr. Carl Rahmqvist

After some initial implementation assistance from AIC, Transamerica's Information Center took over, developing custom INTELLECT applications for each department. Mr. Rahmqvist and Ms. Dahlgren trained a group of Transamerica's "veteran" INTELLECT users to go into the field to train the company's 15 regional office personnel in using the company's many applications. Transamerica's INTELLECT Support Staff helps company personnel use INTELLECT more effectively. They've also devised several methods for enabling users to access their many INTELLECT applications. Easily understood menu screens help beginning users work faster, while experienced people can use an express mode for their application needs.

"We've found that we've saved both time and money by using INTELLECT to obtain pertinent information."
—Ms. Sandra Dahlgren

Anyone who can ask a question in everyday conversational English can get the information he or she needs. Immediately. You can imagine how much time a system like that can save an information-dependent organization like Transamerica. Combine that with the ability to get more people into the system and you can see how INTELLECT has increased the pyramid's power.

Find out how INTELLECT can get your organization into better shape. Write for a free demo diskette. Or for fast action, call AIC at (617) 890-8400.

WORLD DIGEST

TOKYO — IBM Japan has reportedly halted production of its JX, the Japanese version of the IBM PCjr, because of a slump in orders here. IBM began shipments of the JX in November, targeting business and home users. The machine is produced locally by Matsushita Electric Industrial Co. NEC Corp.'s PC-9801 is way out in front in the low-end microcomputer market here, which partially accounts for the JX's limited success, analysts reported. Furthermore, the demand for microcomputers for home use is almost satisfied in Japan, analysts said.

BRISBANE, Australia — Queensland residents have shown little interest in electronic funds transfer cards. A survey conducted by the Queensland Institute of Technology indicated that a massive education campaign will be needed before large-scale introduction of the technology is feasible. Two-thirds of the people polled said they would not use EFT facilities, and more than half were negative toward the whole concept of EFT at point-of-sale terminals. Among those who expressed some interest, 61% said they would not be willing to pay a transaction fee for the facility. In general, the public showed a low awareness of technology; just 30% of those surveyed had heard of EFT.

AMSTERDAM — The Dutch Advertising Ruling Committee found the Victor Vickey to be noncompatible with IBM. The Victor portable personal computer was being offered by Dutch importer LCI Computer, which advertised the system as compatible with the IBM Personal Computer. The Committee ruled otherwise after it was requested to authenticate the company's claim of compatibility.

BEIJING — More than $1.5 million worth of Perkin-Elmer Corp. equipment was installed here recently. In May, China National Oil and Gas Engineering Development Corp. installed two PE 3230 minicomputers and a 3205 system on its Shanghai oil rigs.

A month earlier, the Central Iron and Steel Research Center here installed a PE 3252 XP, a 3205 and two 7350A minicomputers.

MELBOURNE, Australia — The National Australia Bank has ordered $62 million worth of new IBM equipment, including three mainframes and an automatic teller machine (ATM) network for self-service banking. The order calls for three 3090 Model 200 series mainframes and upgrades for its IBM 400 series units, disk systems and peripherals, as well as about 1,400 finance and general-purpose terminals and 200 ATMs. Other equipment on order includes a 3890 series reader/sorter, about 500 IBM 3270-type terminals, approximately 300 IBM 5922 series document readers, a number of 3725 communications controllers and upgrades to existing 4700 series controllers. The order does not include software, on which the bank spends about $8 million annually, a spokesman said.

MUNICH — In a major coup for Siemens AG here, Messerschmitt-Boelkow-Blohm (MBB) GmbH, a military equipment manufacturer, has decided on two jumbos from Siemens' 7890 S line. Pricing on the Siemens equipment, manufactured by Fujitsu Ltd., was the deciding factor, according to a spokesman.

The contract with MBB mirrors recent events at other major German firms: Bayerischen Motoren Werke AG and the German car association Adac GmbH both chose Siemens over IBM equipment.

TOKYO — AT&T International and Ricoh Co. will form a joint venture company called AT&T Ricoh Co. to market selected AT&T office automation and telephone products in Japan.

Under the terms of the agreement, AT&T will own 51% of the new company, and Ricoh will own 49%. The company will reportedly start doing business on Sept. 1. Ricoh currently supplies facsimile equipment to AT&T Information Systems in the U.S.

BRISBANE, Australia — Queensland secondary schools will move computer studies away from the hardware/software emphasis of the 1970s with a brave new syllabus designed for the 1990s.

A curriculum to be introduced in January will introduce fourth- and fifth-generation languages, knowledge engineering and the practical application of fourth-generation languages. A microcomputer-based implementation of IBM's relational data base language SQL will be used for the program by Queensland Information Technology, sources said.

An intensive training program has overcome the problem of finding teachers able to handle the course material.

MELBOURNE, Australia — Software developer BBJ had a successful trip to the National Computer Conference held last month in Chicago.

It clinched a $150,000 sale of its application software to a Canadian mining company, and signed up a Scandinavian distributor for its Today software, an AT&T Unix-based program generator.

BBJ's booth was set up by the company's U.S. subsidiary because managing director Ken Begbie opted not to participate in the national stand organised by the Australian Federal Department of Trade.

Products on display included Today and a range of packages for Hewlett-Packard Co.'s HP 3000 line of computers.

MELBOURNE, Australia — A cost-benefit analysis has convinced a Victoria, Australia, insurance company that it should drop a 10-year-old outside service bureau contract and start processing in-house. The move will call for about $1.3 million worth of computer equipment, a computer room and 12 new staff members at Vacc Insurance Ltd. The firm has an 8M-byte Facom M360R with 5G bytes of disk storage, three tape drives and a laser printer from Fujitsu Ltd.

SYDNEY, Australia — With sales of $29.5 million during the first half of 1985, Prime Computer of Australia Ltd. has recorded its strongest first-half growth to date. Product revenue for the second quarter was $12.6 million, up 60% from the same period last year. In 1984, Prime's Australian revenues totaled $40.6 million. The firm expects 1985 revenues to reach $60 million.

NEC wraps Geisco services into its Japanese NEC-Net

ROCKVILLE, Md. — General Electric Information Services Co. (Geisco) said last week it signed an agreement with NEC Corp. of Japan that will make NEC Geisco's primary distributor of its worldwide teleprocessing services in Japan by interconnecting with NEC's new value-added Japanese network — called NEC-Net.

Geisco said NEC will offer its clients access to international teleprocessing applications — such as international order entry, cash management and electronic mail.

Geisco and NEC have also agreed to set up a joint venture company called C & C International Ltd., which will provide marketing and technical support for Geisco's services in Japan.

Geisco is a wholly owned subsidiary of General Electric Co.

Sicob scheduled for September in Paris

PARIS — The 36th Salon International D'Informatique, Telematique, Communication, Organisation du Bureau et Bureautique (Sicob) conference and exhibition will be held from Sept. 18-27 in the Cnit exhibition center, Paris la Defense. The show is geared to data processing professionals, including manufacturers, computer engineering firms, DP managers, systems engineers and analysts.

The general theme of the event is "Data Processing: Opportunities and Drawbacks." Seminars scheduled within the framework of Sicob include "Convention Informatique" (Sept. 16-20, Palais des Congres), "Infodial-Videotex" (Sept. 16-20, Palais des Congres) and "Sicob Study and Application Days" (Sept. 18-27, Cnit).

The registration fee is approximately $4 or by invitation.

More information is available from Sicob, 4 Place de Valois, 75001 Paris, France.

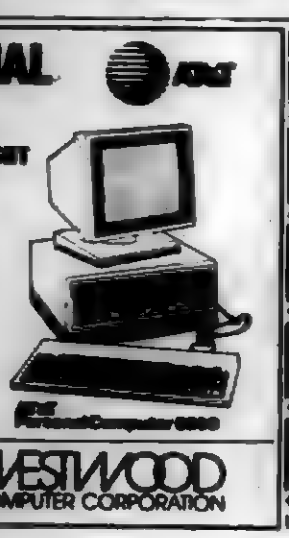
WESTWOOD COMPUTER CORPORATION



BECOME A VSAM EXPERT.

SysEd's new 5-day VSAM course will make you a VSAM expert. You'll not only learn how VSAM works, but *how to make it work well*, and what to do if things go wrong. Even if you're already using VSAM, you'll gain a better understanding of its capabilities and flexibility . . . like how to select among the options VSAM offers for configuring data sets, both batch and on-line.

Our hands-on case study instruction begins the very first day. You'll write and test three real-life programs and use Access Method Services on our own 4341/II computer. There are eight 3270 terminals dedicated to the class. You'll receive individual attention from our experienced teachers, and you'll want to bring your actual programming and debugging problems to class.

SysEd's VSAM course contains the most up-to-the-minute information available anywhere, including the latest features and capabilities of VSAM, and is in line with state-of-the-art hardware.

SysEd courses are held weekly and on weekends at our training centers in New York City, Chicago, San Francisco and Dallas. On-site courses at your own computer installation are also available. *Classes are limited*. For early enrollment or more information call Dave Shapiro (212)564-6147

Net meet set for Sept. 16

SAN FRANCISCO — "Fiber Optic Communications and Local-Area Network Exposition," sponsored by Information Gatekeepers, Inc. is scheduled for Sept. 16-20 at Brooks Hall here.

The exposition is geared to communications managers who purchase, design, evaluate or recommend any type of fiber-optic or local-area network, according to the sponsor.

The conference will begin with in-depth one-day or half-day seminars scheduled on Monday and Tuesday. Topics include case studies from a number of industries. Other topics consist of the fiber-optic market, system design and sensors.

On Wednesday, exhibits will be shown, and there will be a number of shorter sessions addressing topics such as single-mode technology, fiber-optic passive components and fiber-optic sensors, Information Gatekeepers said.

Fees for the three days of exhibits and sessions range from $100 to $250.

The half-day tutorials cost $200.

Full-day course fees range from $395 to $495.

Information Gatekeepers is located at 214 Harvard Ave., Boston, Mass. 02134.

Datastorage '85 targeted at executives

SAN JOSE, Calif. — Datastorage '85 — the fourth annual international Datastorage forum — will convene Sept. 16-18 at the Red Lion Inn here to address critical industry issues and areas of change in data storage equipment and applications.

The forum is designed for executives who set the strategic directions of their companies. This year's conference will explore the role of the subsystem, rigid disk media trends, ⅛-in. tape cartridges in the OEM market, new directions for ¼-in. tape drives, readiness of optical storage products and personal computer data storage requirements.

The registration fee is $925. Information is available from Forum Management, Cartlidge & Associates, Inc., Suite M259, 1101 S. Winchester Blvd., San Jose, Calif. 95128.

"Our team has been selected to find an inexpensive substitute for accuracy."

No-Breakthrough Technology from LeeMAH.

Computer crime is a real threat. Because nothing can damage your business faster than lost or stolen data.

Which is why you need a Secure Access Multiport (SAM) System from LeeMAH.

SAM Cuts Off Unauthorized Access.

Thanks to a very simple process, your data is perfectly safe.

You just phone in and enter a personal location code. SAM then disconnects the line and calls you back.

It stops the home hacker cold. Because SAM can only call back a terminal if the phone number is stored in memory.

And SAM doesn't acknowledge phone calls with tell-tale tones. So if someone's randomly dialing numbers to find a computer, they'll never know if they've found one.

Best of all, SAM can disconnect the line even when the caller refuses to hang up. So no one can ever enter a stolen access code.

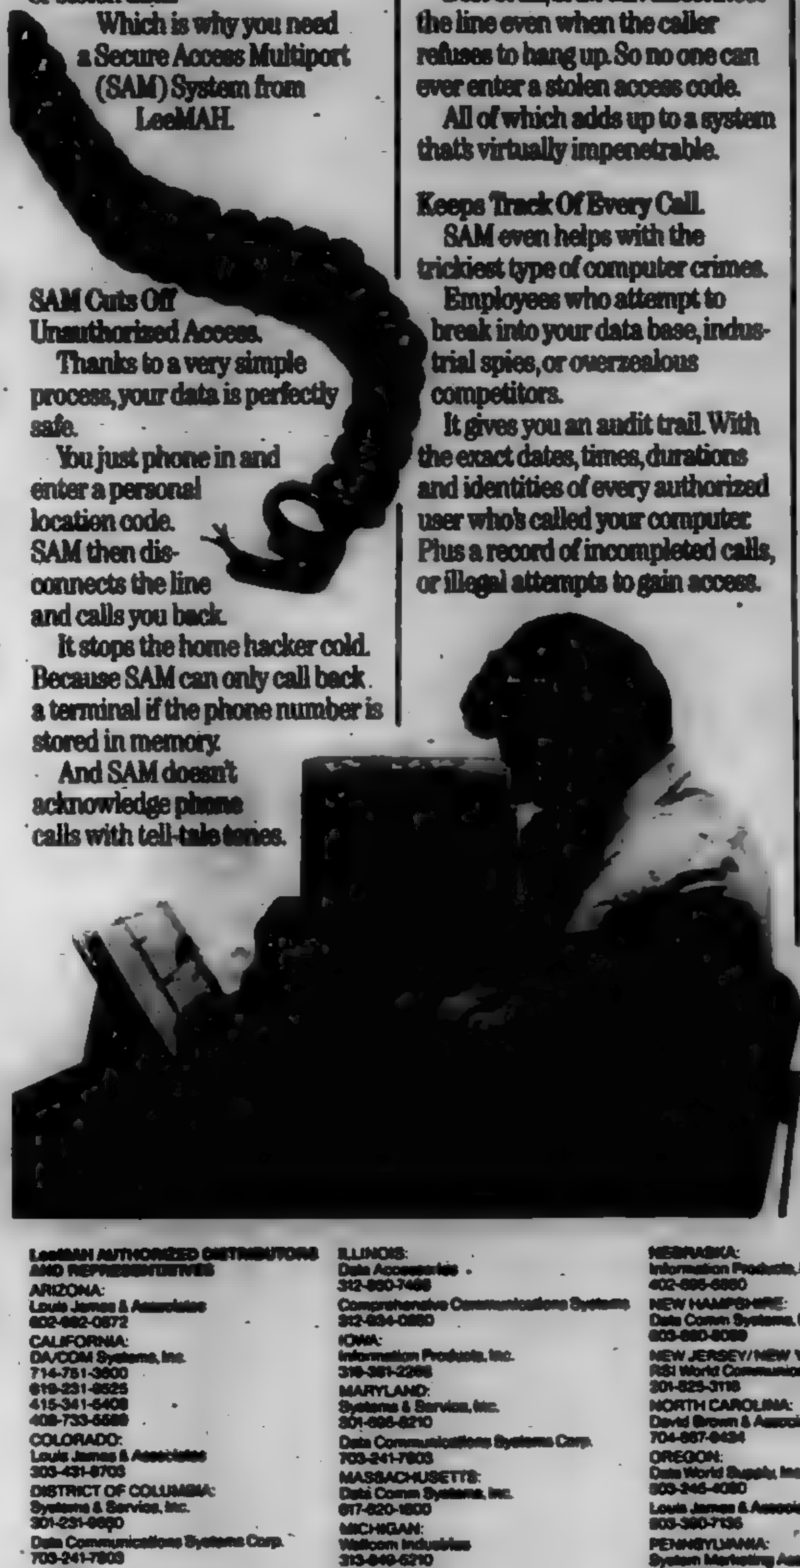
All of which adds up to a system that's virtually impenetrable.

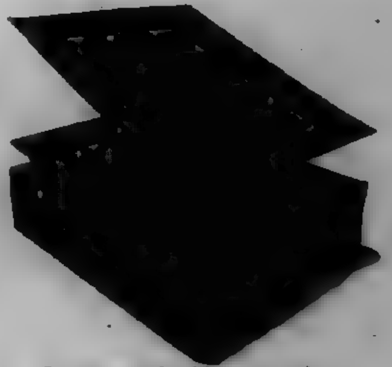
Keeps Track Of Every Call.

SAM even helps with the trickiest type of computer crimes.

Employees who attempt to break into your data base, industrial spies, or overzealous competitors.

It gives you an audit trail. With the exact dates, times, durations and identities of every authorized user who's called your computer. Plus a record of incompleted calls, or illegal attempts to gain access.





So you get double protection against theft.

A Record That Couldn't Be Better.

SAM systems are already protecting more than 6,000 computer ports around the world.

With no known breakthroughs.

That's why LeeMAH is the leader in call-back security systems. And why hundreds of companies turn to us for data protection. We're not just more economical, we're more effective.

After all, no-breakthrough protection does more than protect your data.

It protects your business.

LeeMAH Datacom Security Systems are available for immediate delivery.

System beefs up surgical instrument maker's operations

ST. LOUIS — A surgical instrument manufacturer here that cut over from batch processing to an on-line, closed-loop system has reduced its inventory and delivery times and added to its understanding of customers' needs.

Storz Instrument Co., which makes microinstruments, used for eye and ear surgery, along with other medical devices, logs sales of more than $50 million a year. Each day, it ships more than 600 customer orders that represent approximately 1,500 items.

The firm's management depends heavily on its manufacturing software system, NCR Corp.'s Manufacturing Information Support System Integrated On-Line (Mission) to keep track of orders, inventories and shipments in order to gauge customers' needs. The software draws on marketing forecasts to schedule production; it then reports sales bookings, which the firm uses to update its forecasts.

"The closed loop . . . begins with customer demand and closes with revision of our perception of customer demand," said James E. Brands, Storz's senior vice-president of finance and administration.

Storz runs 10 modules of the Mission software — master production scheduling, order processing, inventory management, bill of materials, materials management, routing, costing, material requirements planning, purchasing and receiving — on a 4M-byte NCR 8575M mainframe. The software interfaces with homegrown sales, marketing and forecasting programs.

Other business software — financial systems and the like — run on the mainframe, but Brands said the manufacturing system is more central to the firm's operations.

'No. 1 objective'

"It's obvious that a company of this size and complexity must have computerized systems for sales, bookkeeping and so forth. We couldn't operate even poorly without them today," he said. "But the most significant thing we get from data processing is not record keeping or accounting. It is the ability to maximize the extent to which we satisfy customer demands. And this is our No. 1 objective."

Storz brought up most of its software modules in July 1983 to replace a largely batch processing system. The system had provided some on-line inquiry, but employees could only access day-old data that had been processed overnight.

Employees have on-line access to the system; through any one of about 80 VDT terminals, a worker can enter data and inquire about the status of customer orders anytime between 7:15 a.m. and 5:30 p.m. "We're working with much more detailed, timely and accurate information than we ever had before," Brands said.

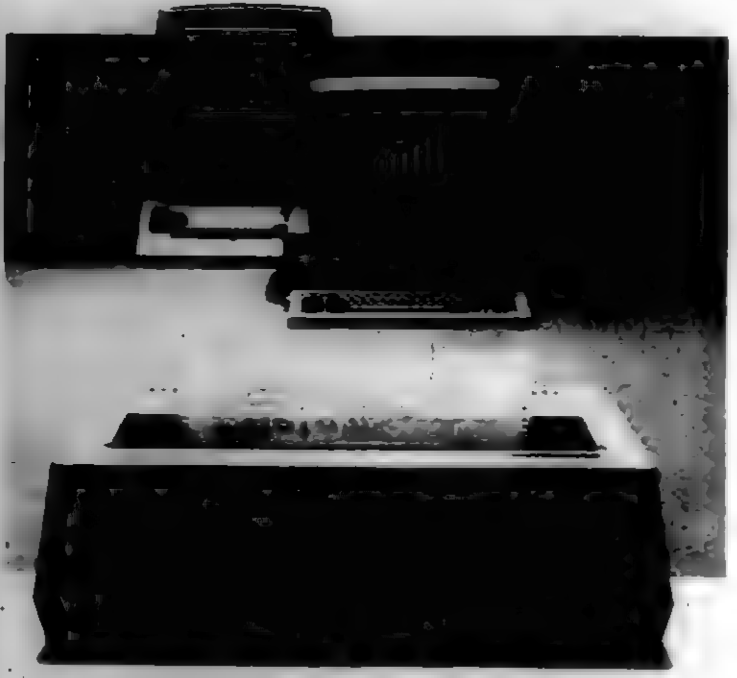
Two Storz divisions use the manufacturing system: the instrument division, which makes hand-held surgical instruments; and the equipment division, which makes larger products such as ultrasound devices. The equipment division has had its operations on the system longer and has logged some substantial results. In one year, the division has done the following:

- Cut its inventory by 23% and its inventory carrying costs by 20%.
- Brought back-orders to their lowest level in the firm's history.
- Decreased its number of production line shutdowns caused by inventory shortages.
- Cut its customer order turnaround time in half.

According to Storz' MIS director, Carl W. Riebeling Jr., both the equipment and instrument divisions have gotten less-specific benefits as well.

"Although people are still getting educated in the new ways, they can already see many intangible benefits from the availability of better information across the company and from a common data base," he said. "For instance, manufacturing and marketing now work with the same facts, and information is readily available for customers via 10 customer service representatives at video terminals."

Riebeling said Storz is still developing and refining its manufacturing system and will continue to change the software as business dictates.



YOUR IBM 3270 AND YOUR IBM PC NOW HAVE SOMETHING IN COMMON BESIDES THEIR PARENTS.

THEIR PRINTER.

It's one thing for a high speed dot matrix printer to be plug-compatible with the IBM 3270 system.

It's quite another for the same printer to work in the ASCII universe where IBM's PC communicates.

But the Datasouth CX 3180 is quite another kind of printer.

First, the CX 3180 does more for less. Because while the 80 cps version of the IBM 3287 costs $4800, and the 120 cps version costs $6000, the CX 3180 cruises at 180 cps and costs only $3195.

Second, the CX 3180 is truly plug-compatible, with a coax interface for the 3270 world and a parallel interface for the PC world. With no black box and no extra cables.

The CX 3180 even features dual legends on its sophisticated front panel controls. One set emulates the IBM 3287 and the other works for your PC—or for any other ASCII computer. And the parameters are switch-selectable.

The CX 3180 is also a printer in the Datasouth high performance tradition. Which means it's one of the most rugged and sophisticated printers ever made.

So if you want the best of both worlds, get the one printer that does it all: the Datasouth CX 3180.

For more information about the CX 3180 and the whole family of high performance Datasouth printers, call toll-free.

Wang users schedule meet

BOSTON — The Wang Users Society of America is sponsoring Index '85, the first independent exposition for users of Wang Laboratories, Inc. equipment. The show will be held Sept. 30 to Oct. 2 at the Park Plaza Castle here.

The show will feature vendors of Wang-compatible hardware, software and services and will be held concurrently with the International Society of Wang Users meeting sponsored by Wang at Boston's Marriott at Copley Place.

Admission to Index '85 is $25.

More information is available from Independent Expositions, Inc., 786 Rockrimmon Road, Stamford, Conn. 06903.

MORE THAN 1,000 LARGE NETWORK USERS DON'T HAVE TO FIT NCR COMTEN.

NCR COMTEN FITS THEM.

There are two basic choices in developing a data communications network: you can compromise your objectives to fit the limitations of the system; or you can choose a system with a flexibility to accommodate your needs.

NCR Comten gives you the latter option. Our Communications Network Architecture lets you accommodate yesterday's and today's technologies in your present network and anticipates future and emerging technologies without major equipment change.

Fitting our system to your needs is just part of the NCR Comten story. You'll find more good reasons in our special executive briefing. For details, write "Data Communications Systems", NCR Comten, Inc., Department 8015, 2700 Snelling Ave. N., St. Paul, MN 55113. **Or call 1-800-334-2227. In Canada, call 1-800-543-5713.**

NCR COMTEN DATA COMMUNICATIONS.
KNOWN BY THE COMPANIES WE KEEP.

NCR Comten, Inc.

ONLY A NETWORK THIS MANAGEABLE

Are you in control of your data network? Or a slave to it? Locked into hardware that limits your options? Overburdened by maintenance? And trapped by multiple systems you can't manage?

The Information Systems Network from AT&T lets you take command. It's the only data network that allows you to integrate and manage your terminals, workstations, PCs, minis and mainframes as a single corporate-wide data network. It's the only network you can completely control.

You've got the whole network in your hands.

ISN's hierarchical star topology centralizes system administration and maintenance. The hub of the system is a fast-switching Packet Controller. It's linked to all data devices and manages all network functions. So, if one device goes down, the Packet Controller keeps your network up and running.

A System Control Console taps right into the Packet Controller. From this terminal, you can manage the network using simple English commands. You can add or move equipment, monitor network performance, track down faults and take corrective action—without disrupting network operations.

With a special password, you can perform maintenance functions from any asynchronous terminal in the system. And you have the option of remote maintenance from one of our service centers. ISN gives you multiple points of control.

You've got plenty of flexibility.

ISN links the devices in your network with twisted copper wire and fiber optics. It uses our Premises Distribution System wiring scheme which allows easy modular growth.

ISN is flexible and open to change. Start with as few as 50 devices and let it grow. ISN's open architecture allows you to easily add on new devices and new technologies as they emerge. ISN can take things as they come.

Linking multiple Packet Controllers lets you expand ISN to any size network. You can grow across one premise or across the country. And no matter how large your network gets, you choose the means of control—centralized or distributed. With ISN you're the boss.

You can bridge the communications gap.

What happens to your PBX? PC networks? Data processing systems? And all that hardware from Big Blue? ISN gets them all on speaking terms.

You can link ISN with the AT&T System 85 or AT&T System 75 PBXs. Whatever you have—data processing equipment and office

LETS YOU BE MASTER OF YOUR UNIVERSE.

automation equipment; isolated Ethernets,™ AT&T's STARLAN PC Network and 3B Net; smart and dumb—ISN gets it all working together. All sharing the same resources. With you in total control.

And what about those IBM 3270s? ISN makes them work even harder. Now your 3270 terminals can access multiple IBM hosts. And low-cost dumb terminals can do the same. Asynchronous and synchronous traffic can travel through your network with the same speed and efficiency.

You can handle heavy traffic.

ISN maintains a high end-to-end transmission speed of 8.64 mbps, and a high throughput rate even when traffic is at its peak.

Long messages or bursty transmissions—ISN's been engineered to handle it all. A unique centralized short bus and perfect scheduling access method permit messages to travel through the network almost instantaneously. And arrive with their integrity intact. So there's no waiting. No bottlenecks. No retransmitting data.

You've made the right connection.

AT&T has a long history of solving complicated networking problems with clear-cut, intelligent solutions. We know how to tie it all together.

And we know how to work with you. Our professional sales and service people are with you every step of the way—planning, designing and maintaining a network that will meet your business needs today and tomorrow.

ISN reflects AT&T's better approach to office automation. To learn why it's the right choice for your business, call your AT&T Information Systems Account Executive, or 1 800 247-1212.

CALL FOR PAPERS

SECURICOM '86: 4TH WORLDWIDE CONGRESS ON COMPUTER AND COMMUNICATIONS SECURITY AND PROTECTION

Cannes, France, March 5-7

Papers are now being sought for this fourth worldwide congress. Topics include but are not limited to the following: electronic banking security including electronic funds transfer, authentification, identification, cryptography, point of sale and key management; network security including transborder data flow; security implications of new media including videotex, facsimile and Integrated Services Digital Network; security within microcomputers and distributed systems; juridical aspects of computer security; computer security as a management function; and DP incidents.

Send five copies of the paper to Securicom-Sedep, 8 rue de la Michodiere, 75002 Paris, France.

THE ELEVENTH ANNUAL SAS USERS GROUP INTERNATIONAL CONFERENCE

Atlanta, Feb. 9-12

A call for papers has been issued for this annual international conference. Authors are invited to submit papers on the following topics: capacity planning and evaluation, systems software, econometrics, time series and operations research, education and consulting, graphics, information centers, macro facility, microcomputers, posters and statistics.

Papers/posters must be postmarked no later than Sept. 1. Two copies each of a 200-word abstract and a working draft are also required by Sept. 1. Forms for submitting abstracts may be obtained by contacting SAS Institute, Inc., Box 8000, SAS Circle, Cary, N.C. 27511.

THE SIXTH INTERNATIONAL CONFERENCE ON DECISION SUPPORT SYSTEMS

Washington, D.C., April

Papers for presentation at this Sixth International Conference on decision support systems (DSS) are being sought. Topics include builders of DSS and expert systems used for decision support; managers, executives and others who use DSS; researchers in the technical, behavioral and managerial aspects of DSS; vendors of DSS products and services; information systems managers/information center managers who are responsible for or are affected by DSS in their organizations.

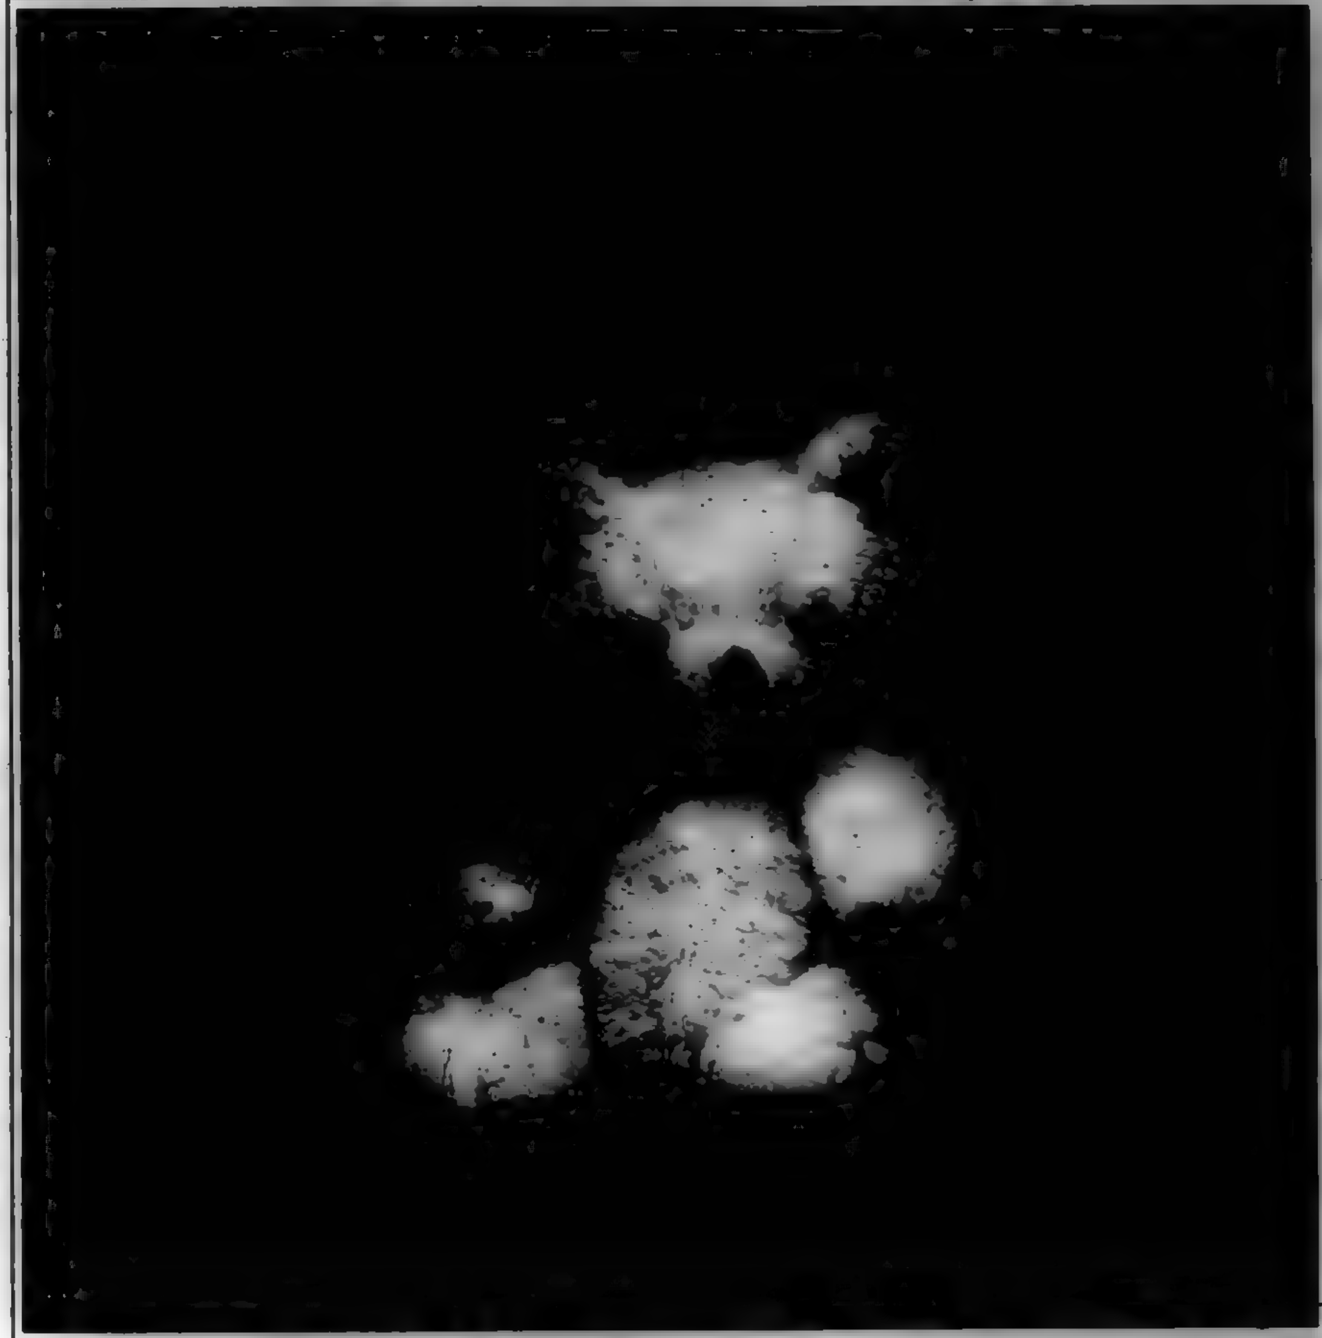
Three copies of the formal paper or paper summary should be submitted no later than Sept. 16 to Prof. Jane Fedorowicz, School of Management, Boston University, 704 Commonwealth Ave., Boston, Mass. 02215. Questions relating to papers, presentations and panels may be addressed to Jane Fedorowicz or to Vincent Barraba, Eastman Kodak Co., 343 State St., Rochester, N.Y. 14650.

THE EIGHTH INTERNATIONAL CONFERENCE ON PATTERN RECOGNITION

Paris, Oct. 28-31

A call for papers has been issued for this international conference being held in Paris. The official language of the conference is English. Papers are being sought on the following topics: data classification; clustering algorithms; signal and image processing; pattern analysis; feature recognition; pattern directed interface; inductive learning; modeling of human perception; image understanding and recognition; speech understanding and recognition; computer vision; expert systems in pattern recognition; specialized architectures; very large-scale integration for pattern recognition; industrial applications; robotics; biomedical pattern recognition; remote sensing; office automation pattern recognition; and text understanding and verification.

Prospective authors should submit four copies of a draft of a full-length paper or a 250-word abstract for poster sessions to: Afcet ICPR Secretariat, 156 Boulevard Pereire, 75017 Paris, France. The deadline for submission of abstracts or poster sessions is Dec. 2.



Yes, FLEE/XP® has been around for awhile. Ten years, in fact. That's a long time for a DOS/VSE linkage editor and librarian to remain current, but there's a very good reason why FLEE/XP is still so popular. FLEE/XP makes people feel secure. Folks love it, and go on loving it. In fact, FLEE/XP took first place in the most recent Data Decisions user survey, with the highest score ever recorded. After ten years, that's true love.

You can't find the kind of peace of mind you get from FLEE/XP with any other product. More than 1500 very happy and secure users will tell you so. If you're worried about the nightmare of unscheduled condenses, or corrupted libraries, FLEE/XP can be a real sweet dream.

So try FLEE/XP now, and for the first time in your life, believe that there's someone you can always count on; FLEE/XP from Goal Systems. And have a good night's sleep . . . because there *is* somebody you can trust.

DBMS pumps up pacemaker company's tracking system

MINNEAPOLIS — The department that tracks clinical studies of pacemakers and other medical devices for a manufacturer here cut its staff size and more than doubled its work load after it replaced a homegrown, hierarchical data base management system with a packaged, relational one.

Medtronic, Inc.'s 14-member clinical evaluation staff currently monitors about 34 studies a year; in 1982, the staff — with 16 employees — handled 15 studies annually. The studies track human implants of pacemakers and other devices so Medtronic can meet Food and Drug Administration (FDA) requirements and determine whether it should market given products.

Improvements in the staff's productivity came largely from a relational system, Sir, Inc.'s SIR/DBMS, that Medtronic brought up during the spring of 1982, according to Tim Church, manager of biometry for the firm. With the DBMS, for example, staff members can pull together in as little as three weeks' time FDA reports that once took up to two months.

Two major drawbacks

The system runs on an 8M-byte Prime Computer, Inc. Prime 750, and staff members access data through nine Vector Graphic, Inc. personal computers, one Compaq Computer Corp. portable micro and two Televideo Systems, Inc. terminals. SIR/DBMS replaced a hierarchical system called Medque that had been developed in-house during the late 1970s. According to Church, the old DBMS had two major drawbacks: inflexibility and a limited reporting capability.

Inflexibility. Medque supported only two levels of data structure, and its inflexibility imposed strong restraints on the clinical evaluation staff. For each device implant, the system supported one record of the initial implant and a set number of follow-up files that staff members established at the beginning of the study.

"If the scope of a study changed in the middle and we needed more space than we allocated," Church said, "it meant stopping the project to redefine all of the files, unloading the data already entered and reloading it into the new files." The process delayed studies and taxed Medtronic's one full-time programmer and his part-time assistant.

Besides impeding the collection of data from the studies, Medque's structure hampered efforts to manage the studies themselves. Administrative details, such the names of participants and indicators of progress, had to be entered on the implant record with clinical data.

This approach cluttered the implant record; it also blocked staff members' efforts to get at data they needed. "We had no way of isolating the administrative data so we could really use it to keep track of our studies," Church said.

Limited reporting capability. Medque's structure led directly to this second drawback. Church said nontechnical users could easily generate reports that the system's two-level hierarchy supported, for example, a tally that counted instances of a given occurrence. Only experienced programmers, however, had the wherewithal to work around the structural constraints and develop more complex reports.

"Our limited programming staff could not keep up with the demand for data," Church said. "Far too much of [its] time was being spent accessing data and performing analytical tasks for other, less technical users."

The relational DBMS that Medtronic now uses has helped the firm overcome both problems.

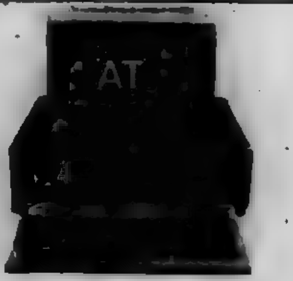
According to Church, SIR/DBMS gives the clinical evaluation staff the flexibility it needs to do its work. The staff sets up separate data bases for administrative and clinical information. Because of this, he said, "we have much better administrative control of our studies, and our study data bases are now completely dedicated to the collection and analysis of study data."

Medtronic's evaluation staff can also organize data bases differently according to the nature of the information they contain. "[The DBMS] allows us to use the natural structure of our data — whatever that structure may be — to its best advantage," Church said. Medtronic uses a network data model for its administrative data base, for example, and a hierarchical model for most of its study data bases.

The DBMS also offers a range of features that help researchers put together reports on administrative and clinical data.

- A query and retrieval language, based on IBM's SQL, allows nontechnical users to put together simple ad hoc reports — lists and summaries, for example. Church said most of the evaluation staff members use this feature, and all of them will eventually learn it.
- A report definition language lets technical users set up complex reports. The language sorts and groups data; produces titles, column headings, totals and subtotals; and formats final reports. Programmers use it to set up menus that will call information from the data base.

COMPAQ could have stopped here



[illegible]

Medtronic's programmers use this feature to set up standard reports that evaluation staff members can call for again and again. Staff members work through menus to select standard formats and generate printed reports. Once a user selects a format, Church said, he can generate a report within a half hour.

■ A simplified report generator, which relies on defaults for some of its logic, offers many of the same abilities as the report definition language. At Medtronic, programmers use it to format relatively complex ad hoc reports.

■ SIR/DBMS' organization supports Medtronic's various data structures and provides for easier logical reporting than Medque did.

According to Church, the ability of staff members to produce accurate reports is a critical factor in Medtronic's business.

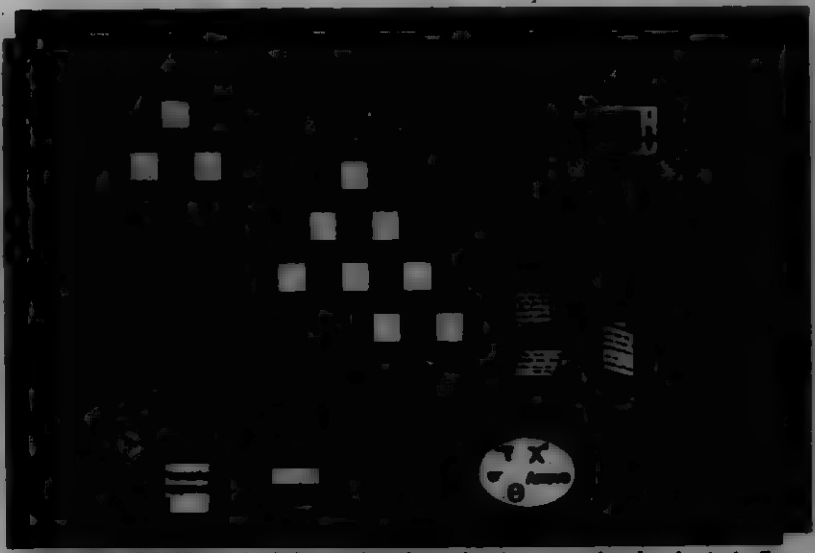
"The more efficiently we can produce the various regulatory reports and approval applications required by the FDA," he explained, "the more quickly we can bring our products to market."

Resource shortage limits productivity

Staff members' productivity, however, has been somewhat limited because of a shortage of system resources.

The clinical evaluation staff shares the Prime 750 with Medtronic's accounting staff, and the machine is frequently overloaded, according to Church.

In the future, the firm plans to buy a dedicated minicomputer to run both the DBMS and a statistical software package that the evaluation staff uses.



Medtronic's DBMS tracks information throughout pacemaker implant studies.

...but we didn't.

Introducing the new COMPAQ PORTABLE 286.™
More features, more speed...more useful.

Most people think the IBM® Personal Computer-AT™ can do more than any other personal computer. But now COMPAQ® offers a personal computer that does more in a package *half* the size, complete with a handle.

Incredibly fast

Most computer companies would consider it a breakthrough to make a computer with the power and speed of the IBM PC-AT. But not COMPAQ. The new COMPAQ PORTABLE 286 runs all the popular programs 30% *faster.*

And no doubt most would have been elated to put 20 Megabytes of fixed disk storage in a portable computer. But we didn't stop there. We designed the COMPAQ PORTABLE 286 to accept an internal fixed disk drive back-up system as well. It protects your data on pocket-sized tape cartridges, something not even the IBM PC-AT can do.

Room to grow

Once we got started, it was hard to stop.

There's room for up to three internal storage devices. Choose from 1.2-Megabyte or 360-K byte diskette drives, the fixed disk drive and fixed disk drive back-up.

Add up to 640-K bytes of memory on the main board. Then add up to 2 more Megabytes using an expansion board. That gives you more memory than most desktop computers.

For displaying your work, a built-in monitor shows high-resolution text *and* graphics. A second monitor isn't necessary.

Does more—anywhere

Together, all these features add up to our fastest, most powerful portable computer. It helps you do more, in more places.

Of course, if you need a computer with even more power, we designed a model that stays in one place.

The new COMPAQ DESKPRO 286™. With up to 8.2 Megabytes of memory and 70 Megabytes of storage, it can take you beyond today's limits of desktop personal computing.

COMPAQ offers personal computers beyond compare. Because we make them without compromise.

For a free brochure or the location of your nearest Authorized COMPAQ Computer Dealer, call toll-free 1-800-231-0900 and ask for operator 6.

COMPAQ

It simply works better.

PORTABLE 286™

DBMS manages implant studies

Medtronic, Inc.'s clinical evaluation staff uses Sir, Inc.'s SIR/DBMS most extensively to manage the human implant studies it conducts. Studies begin after the Food and Drug Administration (FDA) approves them and continue until Medtronic feels the product being tested is ready for marketing.

By the time the company gets permission to begin an implant study, the clinical evaluation staff has entered preliminary information about it into an administrative data base on Medtronic's Prime Computer, Inc. Prime 750.

The next step in the process is to develop a data entry form that doctors in the field will fill in with relevant information about an implant and set up the study data base.

Evaluation staff members design a data entry form for the study with RJBForms, a homegrown microcomputer software package. RJBForms uses the format of the data entry forms to generate both a data entry program and a data dictionary.

Once the data entry forms are designed, they and the devices involved in the test are shipped out to participating doctors. As the doctors collect information, they record it on the forms and send the forms back to Medtronic. At the firm, clinical aides review the forms for completeness and accuracy and enter information from them into a microcomputer.

An automatic upload program takes the flat Ascii files from the microcomputer, uploads them to the Prime machine and loads the data into the study data base that RJBForms set up earlier. At this point, SIR/DBMS generates and prints an error report.

Throughout the study, the data base management system prints out a variety of reports, including biweekly update reports that show upper management what studies are in progress and annual regulatory reports that the FDA requires.

From the study data base, clinical evaluation staff members also create analysis data bases in which they run statistical analyses on study data using BMDP Statistical Software, Inc.'s BMDP, statistical software developed by the University of California.

When all else fails.

Most diskettes are pretty good.

And some of the time that's good enough.

But next time you throw away one that won't format or you lose the cash flow analysis you've been working on for weeks, make a mental note to try a box of Dysan diskettes.

They're better.

So much better, in fact, that major computer manufacturers put their names on our diskettes and sell them as their own.

Without fear of failure.

You see, we make our diskettes better with advanced manufacturing processes that our competitors have yet to figure out.

And we test them.

Almost to the point of absurdity.

Dysan diskettes are inspected almost a hundred times as they come down the line. They're tested to performance levels way beyond industry standards. And each one is certified to be 100 percent error free.

Then our corporate quality assurance fanatics come along and check them all over again. For all the same things. Plus some things only they understand.

When we're done, you get exactly what you wanted in the first place. Diskettes that will record and retain all your data all the time.

We don't expect you to keep all that in your mental note, but we would like you to remember your last diskette failure.

And when your computer products dealer offers you another box of pretty good diskettes, tell him you're ready for something better.

Dysan.

Call toll free for the name of the Dysan dealer nearest you. (800) 551-9000.

Dysan Corporation, 5201 Patrick Henry Drive, P.O. Box 58053, Santa Clara, CA 95050, (408) 988-3472.

TURNAROUND TIME

Larry Long

Q Six months ago, I hired a new director of information systems. He took over a difficult situation and has been doing very well. The steering committee has approved all of his recommendations to date, but all of us were taken by surprise when he proposed doubling his budget during the next three years, from $3 million to $6 million. He stated that this increase is needed to bring us up to parity with our peer companies.

We are seriously considering approving most, if not all, of the proposed increase.

But before doing so, we would like to know if other companies are making similar commitments in an attempt to catch up.

In truth, relatively few companies have adopted the giant-leap strategy in an attempt to become state-of-the-art users of computer technology — but more should. If you are way behind now, you can't catch up gradually.

Half of all MIS departments are grossly underfunded. That is, if MIS funding were doubled in these departments, the net result would be a positive contribution to the organization's bottom line. These companies, of which yours may be one, are not taking full advantage of the potential of computers.

Of course, good MIS management is a necessary prerequisite. If your new manager has a well-conceived long-range plan, and you remain confident in his abilities, go for it.

Q I would like your evaluation of my present situation. My data processing career began seven years ago.

I worked for a local government for 4½ years as a programmer/analyst and in industry for two years as a software engineer. The company I was working for had financial difficulties and laid off 25% (50 people) of its staff, including me.

I then accepted what at the time seemed to be a reasonable position, only to find that the DP shop consisted of entry-level programmers. Also, management was deeply involved in a religious sect — my religious preference was asked of me during my interview.

My job involved upgrading the current software to a new system that was purchased from my previous employer.

I had considerable experience with this system. I received a good six-month review, completed the project at 6½ months, and was informed at seven months that my services were no longer needed.

I described this sequence of events during several local interviews and was informed that, "What you're telling us isn't new — they use people like that all the time."

I am currently considering leaving the computer field altogether and would appreciate your views on the following questions: Is this what the data processing industry has to offer — a use-the-people-and-throw-them-away concern for the bottom line? How can a prospective employee obtain an objective evaluation of a company's relationship with its employees?

There is no question in my mind that your previous employer took advantage of you.

However, this unfortunate event is in no way indicative of the DP industry. Harsh, uncaring and even religiously motivated personnel decisions are made in every discipline.

Typical interviewees make two basic mistakes, thereby reducing their chances of an objective evaluation of the company.

First, interviewees don't do their homework; that is, they don't learn about the company's product line, its profit posture over the last five years, its management style and so on.

This type of information can be obtained from annual reports and other publically available information.

Next, the interviewee is too often content to engage in small talk, never asking the hard questions that will render insight into the employer/employee relationship.

When you interview, ask about turnover, potential for promotion, educational support, morale and so on.

When an interviewer sidesteps such questions, this should speak volumes to you.

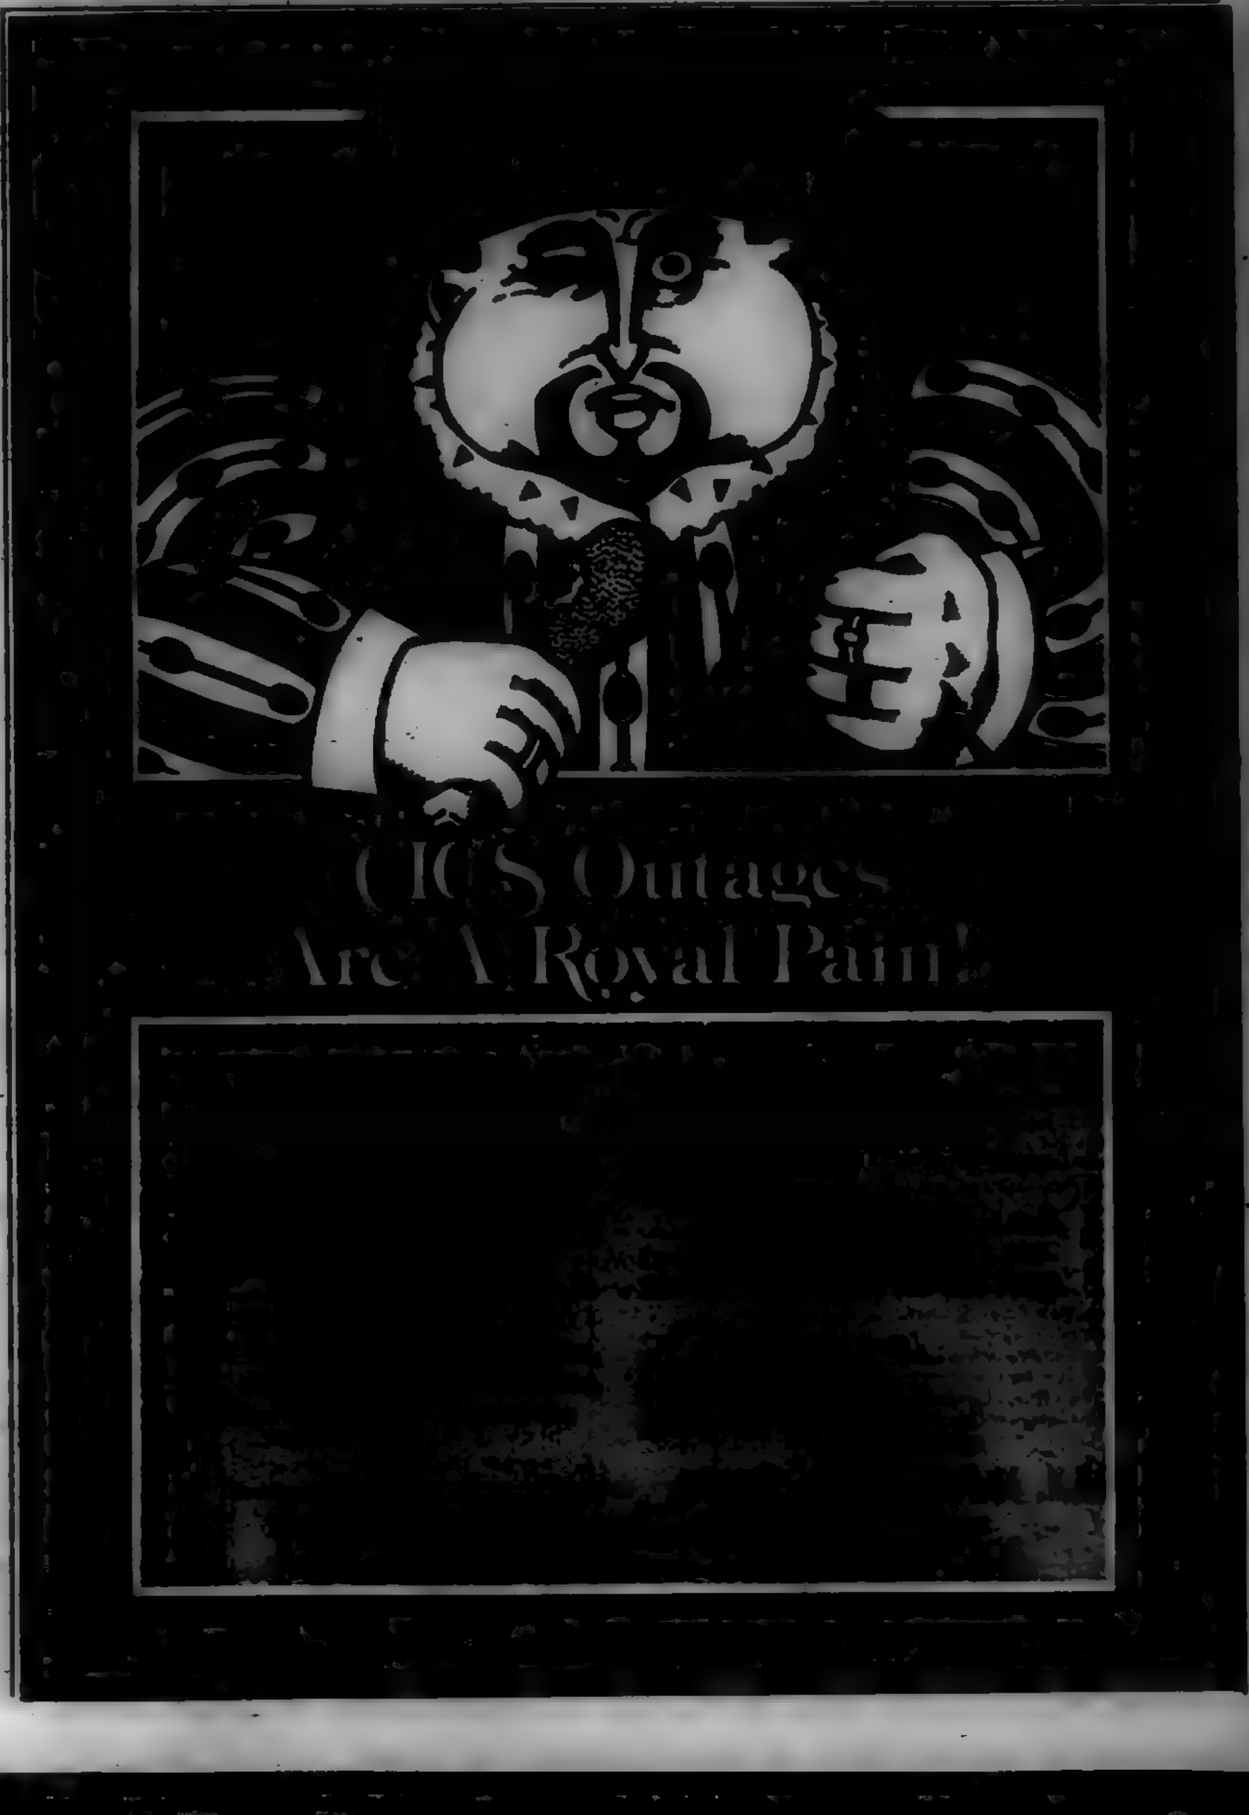
Q I've been an applications programmer since graduation from college 2½ years ago. I have no complaints about my employer or supervisor, but I am having second thoughts about a career in programming.

I'm reasonably good at it and don't have anything else in mind, but I sometimes wonder if I have the temperament for it. What makes a good programmer?

A good programmer is perceptive, patient, persistent, picky and productive.

These are my five "P's" of programming. If you are substantially lacking in any one of these areas, perhaps you should consider a career change.

Long, president of Long and Associates, is a consultant, lecturer and author in the field of information services. If you have a question you'd like him to address, send it to Larry Long, Editorial Department, Computerworld, P.O. Box 880, Framingham, Mass. 01701.



MANAGERS ON THE MOVE

MICHAEL F. MYERS has been promoted to director of systems development in the data processing department of Lincoln National Corp.

Prior to joining the company, Myers spent 12 years with the U.S. Marine Corps serving as a programmer and systems analyst.

Myers, who joined the company in 1980 as a project manager in data processing development, provides project and resource planning, direction and control to the DP development team responsible for the support of Lincoln National's individual products division.

A graduate of the University of Maryland at College Park, Myers holds a bachelor's degree in psychology.

Lincoln National provides life and health insurance and annuities, property and casualty insurance and related financial services.

■

JOHN J. CAHILL has been appointed vice-president of management information systems for Intercontinental Hotels Corp.

In this position he will be responsible for the MIS function at Intercontinental Hotels, coordinating and implementing short- and long-term planning for systems development, computer processing and telecommunications at the hotel, division and corporate levels.

Cahill has had a long career with ITT and Sheraton Corp., where he was most recently director of hotel computer systems.

He is a graduate of Manhattan College in New York.

■

JOSEPH LACKO has been appointed corporate vice-president of information services for Supermarkets General Corp. in Woodbridge, N.J.

Lacko has been with the company since 1970, beginning his career as a senior systems analyst and was subsequently elevated to a project manager in 1972. In 1975, he was promoted to manager of the information systems development department.

Most recently, he held the position of director for the information service department.

He holds a bachelor of science degree in Business Administration from Seton Hall University, South Orange, N.J., and a certificate of data processing from Rutgers University in New Brunswick, N.J.

■

GARY A. REDDIG has been appointed director of forces management for Eaton Corp.'s Information Management Systems Division.

Reddig joins the division after 20 years of military service in which he was involved in areas related to the Information Management Systems Division activities, including readiness and contingency operations functions; executive management of communications and electronics; airborne command and control systems; and management of automated telephone and telecommunications software development and analysis.

Reddig has a B.S. in mathematics and a B.A. in psychology from North Dakota State University in Fargo. He also has an M.A. in human relations from the University of Oklahoma in Norman.

Eaton is worldwide manufacturer of advanced technology products serving the electronic and electrical and vehicle components markets.

AT&T, IBM eyed

NEW YORK — The Eastern Management Group is conducting a conference titled "AT&T & IBM: New Directions in Technology," at the Plaza Hotel here Sept. 11-12.

Speakers will include Archie McGill, president of Rothschild Ventures, Inc.; Dixon Doll, president of DMW Group, Inc.; John Malone, president of the Eastern Management Group; Ulrich Weil of Morgan Stanley & Co.; and John S. Bain of Shearson Lehman Brothers, Inc.

Among issues to be addressed are IBM's need to capitalize on its Rolm Corp. acquisition to establish network and systems management control, the impact on IBM of AT&T's private branch exchange base in Fortune 500 organizations, how AT&T's marketing naivete is limiting its growth in local-area network and computer equipment sales and to what extent a surge in merger activity will begin a pricing revolution.

The conference will also address whether IBM will continue to make acquisitions in the communications area and whether IBM's activity in the area will spur changes in switching architecture.

The conference registration fee is $795.

More information about the conference can be obtained from the Eastern Management Group, which is located at Four Century Drive, Parsippany, N.J. 07054.

BUILDING
A COMPUTER
CENTER?

If you're planning a new, expanded or remodeled DP facility, you need Datasphere's help.

Since 1968 Datasphere's unique combination of services has saved dollars, frustration and time for large and small firms around the world.

From turnkey—design/build computer rooms to consultation on the smallest project, we'll do all or part—on schedule, within budget! Datasphere is unique—we're engineers, consultants, planners and builders specializing in computer facilities.

Datasphere's engineers are expert in all computer support systems including:

- *Uninterruptible Power Systems*
- *Computer Power Centers*
- *Computer Fire Protection Systems*
- *Computer Type Air Conditioning*
- *Gas Turbines/Diesel Generators*
- *Operation Command Centers*
- *Elevated Flooring*
- *Frequency Converters*
- *Line Filters*
- *Security Systems*
- *Systems Monitors*
- *Voltage Regulators*

Why do [illegible] choose Data Design financial software [illegible] over the three largest vendors?

Because they did their homework. They talked to our customers and found out that for over 12 years, hundreds of Fortune 1000 companies have had exceptional results from financial software systems by Data Design.

They discovered what nationally recognized software surveys confirm year after year: that Data Design has an unsurpassed record of user satisfaction.

They learned they can expect fast, trouble-free implementation with our systems.

They were told that our systems are exceptionally flexible and easy to use.

They found out about our reputation for in-depth training and responsive, knowledgeable support.

They learned that Data Design places only management level people in customer service positions. People who average over 10 years experience—not trainees.

And more.

So, if you're in the process of doing *your* homework on mainframe financial software, call today for our complete customer list, and you too can hear why companies like Alcoa, Amdahl Corporation, Burger King, Estee Lauder, May Company Department Stores, Pillsbury, Sherwin Williams Company, Bankers Trust Company, Central Soya Company, Chicago Tribune, CIGNA Corporation, Federal Express, Litton, Midland Ross, Owens Corning Fiberglas, Perini Corporation, Royal Business Machines, G.D. Searle and Company, Security Pacific National Bank, Warner-Lambert Company, Zayre Corporation, Wisconsin Power & Light and hundreds of others decided on Data Design over other vendors.

And find out why 68% of our customers, who previously had other vendor's systems in place, have now decided to use systems by Data Design.

To learn more about the best financial software available, call toll-free 800-556-5511 or complete and mail the coupon today.

CALENDAR

WEEK OF SEPT. 8

SEPTEMBER 8-11, CAMBRIDGE, MASS. — 1985 Society of Manufacturing Engineers (SME) World Congress on the Human Aspects of Automation. Contact: SME, P.O. Box 930, One SME Drive, Dearborn, Mich. 48121.

SEPTEMBER 8-12, BOSTON — Managing the Explosion: End-User Computing and Emerging Technologies. Contact: Kimberly Gandia, Society for Information Management, Suite 600, 111 E. Wacker Drive, Chicago, Ill. 60601.

SEPTEMBER 9, NEW YORK — CICS/VS Application Programming — Macro Level. Contact: On-Line Software International, Inc., Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024. Also being held Sept. 9-13 in San Antonio and Sept. 11 and 13 in New York.

SEPTEMBER 9-10, ATLANTA — Principles of Prototyping. Contact: Association for Systems Management, 24587 Bagley Road, Cleveland, Ohio 44138. Also being held Sept. 12-13 in Fort Worth, Texas.

SEPTEMBER 9-11, VANCOUVER, B.C. — International Communications and Computer Exhibition. Contact: Tracon Exhibitions, 202-535 W. 10th Ave., Vancouver, B.C., Canada V5Z 1K9.

SEPTEMBER 9-11, WASHINGTON, D.C. — The Data Entry Management Association's (Dema) Ninth Annual Data Entry Management Conference & Exhibition. Contact: Marilyn S. Bodek, Dema, P.O. Box 16711, Stamford, Conn. 06905.

SEPTEMBER 9-11, WASHINGTON, D.C. — Federal Computer Conference. Contact: Federal Computer Conference, P.O. Box N, Wayland, Mass. 01778.

SEPTEMBER 9-12, FORT LEE, N.J. — Vsam From Start to Finish. Contact: On-Line Software International, Inc., Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024. Also being held Sept. 16-19 in San Antonio and San Francisco, Sept. 23-26 in Chicago and Sept. 30 to Oct. 3 in Los Angeles.

SEPTEMBER 9-12, LOS ANGELES — CICS/VS MRO/ISC. Contact: On-Line Software International, Inc., Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024. Also being held Sept. 9-12 in Washington, D.C., Sept. 23-26 in Boston and Sept. 30 to Oct. 3 in Fort Lee.

SEPTEMBER 9-12, MONTREAL — First International Conference on Computer-Aided Technologies. Contact: Stephen J. Leahey, P.O. Box 577, Desjardins Postal Station, Montreal, Que., Canada H5B 1B7.

SEPTEMBER 9-12, SAN ANTONIO — CICS/VS Application Design. Contact: On-Line Software International, Inc., Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024. Also being held Sept. 16-19 in Fort Lee and Los Angeles and Sept. 23-26 in Washington, D.C.

SEPTEMBER 9-13, ATLANTA — CICS/VS Internals. Contact: On-Line Software International, Inc., Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024. Also being held Sept. 9-13 in Boston and San Francisco, Sept. 23-27 in Fort Lee and San Antonio and Sept. 30 to Oct. 4 in Los Angeles and Washington, D.C.

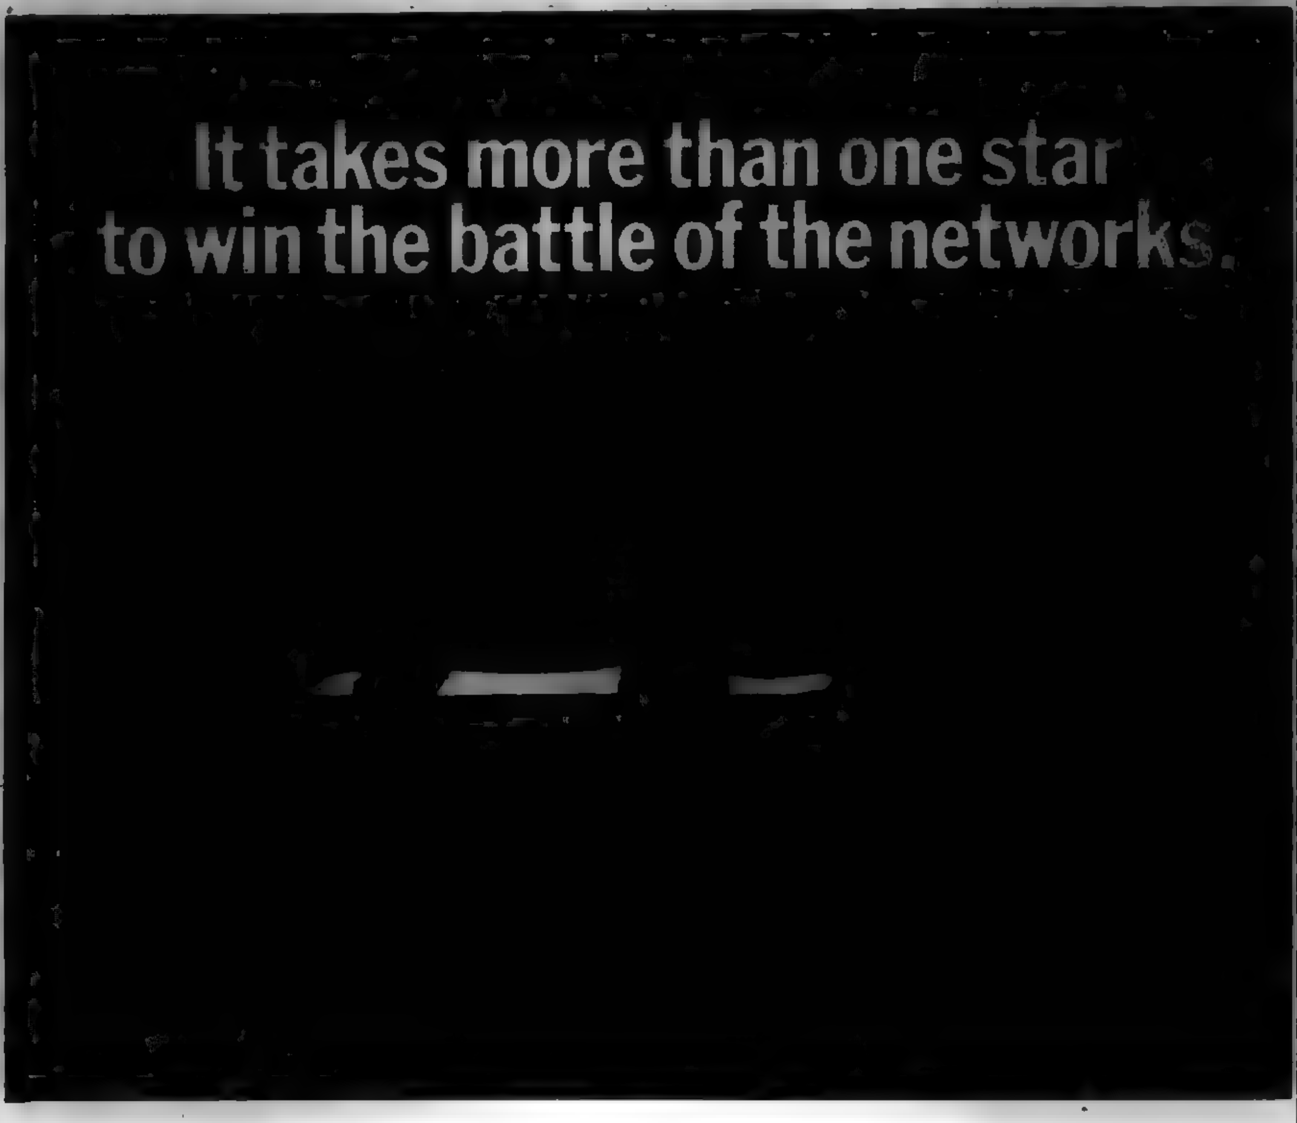
SEPTEMBER 9-13, CHICAGO — CICS/VS Application Programming — Command Level. Contact: On-Line Software International, Inc., Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024. Also being held Sept. 9-13 in Fort Lee and Los Angeles, Sept. 16-20 in San Antonio and Washington, D.C., and Sept. 30 to Oct. 4 in Boston and Denver.

SEPTEMBER 9-13, CHICAGO — Structured Analysis and Design Techniques Workshop. Contact: Elise Rabalais, Learmonth & Burchett Management Systems, Inc., Suite 405, 2800 N. Loop W., Houston, Texas 77092.

SEPTEMBER 9-13, HOUSTON — Data Base Development Workshop. Contact: Elise Rabalais, Learmonth & Burchett Management Systems, Inc., Suite 405, 2800 N. Loop W., Houston, Texas 77092.

SEPTEMBER 9-13, TORONTO — Basic Systems

See SEPT. page 41



It takes more than one star
to win the battle of the networks.

At Novell, we've often wondered why other local area network makers each offer a single LAN system that tries to serve the needs of everyone. The idea seems foreign to us.

That's why Novell offers four complete LAN systems. Every one features the high performance and security of NetWare. Each lets you link multiple LANs together using NetWare Bridges. All four are fully compatible with DOS 3.1, so you can run any application written for the IBM PC Network. And each offers its own strengths to meet your networking needs.

NetWare/S-Net features optimum speed and performance, the extra-large disk capacity of the powerful Motorola MC68000 microprocessor, best overall performance as workstations or workload increase, and a star configuration.

NetWare/ProNET features excellent performance, Proteon's highly rated ProNET interface card, multiple transmission media options, and a token-passing star-shaped ring configuration.

NetWare/ARCNET features high performance, the token-passing technology of Standard Microsystems' ARCNET controller, and the proven reliability of a "string of stars" configuration.

NetWare/G-Net features fast, reliable performance, moderate start-up costs, Gateway Communications' G-Net card, and a single trunk cable configuration.

The Four-Star Network.

With four complete LAN systems, Novell is ready to network your company no matter what your unique needs may be. Instead of trying to fit your company to someone else's LAN, let Novell show you a LAN that fits your company.

For more information, call us at 1-800-LANKIND, or see your local network dealer.

SEPTEMBER 18-19, ATLANTA — Recovery/Restart. Contact: On-Line Software International, Inc., Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024.

SEPTEMBER 18-20, LAS VEGAS — American Production and Inventory Control Society's Fall Seminar. Contact: American Production and Inventory Control Society, Inc., 500 W. Annandale Road, Falls Church, Va. 22046.

SEPTEMBER 18-20, LOS ANGELES — Financial Information Systems: The New Generation. Contact: National Institute for Management Research Seminars, P.O. Box 3727, Santa Monica, Calif. 90403.

SEPTEMBER 18-27, PARIS — Sicob. Contact: Sicob Press Service, 4 Place de Valois, 75001 Paris, France.

SEPTEMBER 21-22, PALO ALTO, CALIF. — Seventh Annual Forth Convention & Banquet. Contact: Forth Interest Group, P.O. Box 8231, San Jose, Calif. 95155.

The first DBMS designed for online systems from the start, finishes first.

Compared to any other DBMS, CCA's MODEL 204 software is faster in a VM, OS, or DOS environment.

And, its productivity stays ahead of the pack even as you add more and more users. Incredibly, the MODEL 204 can support any size network from 30 to 30,000 terminals.

Like the cheetah's speed compared to other animals, the MODEL 204 was designed to be fast from the start. Because instead of being designed for batch, then retrofitted, this DBMS was specifically designed for online systems right from the start.

Impressive as its speed, is capacity. It can handle a few hundred records, or as many as 513 billion! With no limit on each record's size.

Because of its fourth generation tools, tough applications are easy to create, test, or change without affecting the database. And unlike any other DBMS, as your business data tracking requirements change, you can add or change new or existing fields without unloading, recompiling and reloading the database. A dramatic savings of time and manpower.

Very quickly, let us tell you more about MODEL 204's speed and superiority. Send the coupon for more information fast. Or, call 1-800-258-4100.

Send more MODEL 204 DBMS facts fast.

Software innovators creating better ways to manage business.

EDITORIAL

A pioneer remembered

In the annals of computer history, IBM's Philip Donald Estridge will be counted in that topmost tier of individuals who, through a combination of personal brilliance and fate, strongly influenced not only their businesses but also the times in which they lived.

For it can be said that Estridge, killed 10 days ago in a plane crash, did more to institutionalize the microcomputer as a standard business tool than any other person to date. Not only did he, thereby, help to give birth overnight to a multibillion dollar industry, but he also substantially helped change the way corporate America conducts its business.

On the surface, Estridge was an unlikely individual to launch a division at IBM. His freewheeling management style and relative availability to the business and trade press rankled some of his more dyed-in-the-blue-wool counterparts, a style clash that was widely reported to have been a factor in Estridge's transfer earlier this year from the Entry Systems Division to a position with broader corporate responsibilities.

Given enough rope, with which lesser executives might have hanged themselves, Estridge began writing his own rules that would take ESD from a thought in mid-1980 to a $5 billion operation five years later. Although ESD did not design the most functional, powerful or least expensive machine on the market, it did produce a Personal Computer built with off-the-shelf parts — which was largely unheard of in Armonk, N.Y. — and thus gave IBM's Personal Computer assemblers adequate supplies of key components, often from multiple vendors.

As one IBM sales executive said recently, "The Personal Computer has changed the way IBM does business, and we're still learning our lessons from it."

The success of the machine, and of Estridge's strategy, was unlike anything the industry had ever seen.

The same can be said for the still-evolving changes the microcomputer revolution spurred in the data processing shop, where legions of end users are forever changing the nature of the MIS function.

Applause for Amiga

Before the debut of Commodore Business Machines, Inc.'s Amiga personal computer recedes too far in the distance, we want to commend the company for its determination to innovate with personal computer technology — especially in the area of ease of use. Although the Amiga microcomputer currently has serious, perhaps lethal, operating system limitations, it is nonetheless a true engineering breakthrough.

Given a more perfect marketing environment and the resources to work out its technical problems, the Amiga could be a wildly popular business machine. As it is, Amiga will probably survive, if at all, as an entertainment machine.

Whatever the machine's fate, the Amiga's advances in graphics capabilities, system speed, sound reproduction and multitasking functions deserve the attention of conscientious corporate computer management professionals.

Such advances are rare in these times of clones upon clones and should be investigated, applauded and encouraged.

Tenants overlooked in shared services

The articles "Demand Low For Smart Buildings" and "Smart Buildings Hold Little Or No Interest For Tenants" [CW, June 17] accurately reflect the puzzling state of the shared tenant services industry.

In the rush to embrace new telecommunications and information technology and in the euphoria over deals between developers and providers, a key party has been ignored — the tenant. No one, it seems, is looking after the tenant's needs. It's no wonder interest in shared services is so low.

The solution to this puzzle rests in the hands of the developer and the shared service provider. To date, these parties have approached each other as if their interests were dissimilar.

Developers want to limit their involvement. Shared service providers support this position on the mistaken premise that limited developer involvement best serves their long-term profit interests.

Tenant demand and interest for shared services will increase only when developers and service providers can build a relationship on common interest. Meeting tenant needs is the bridge.

Charles B. Coe

Computerworld is a member of the CW Communications/Inc. group, the world's largest publisher of computer-related information. The group publishes 55 computer publications in more than 20 major countries. Nine million people read one or more of the group's publications each month. Members of the group include: Argentina's *Computerworld/Argentina*; Asia's *The Asian Computerworld*; Australia's *Computerworld Australia*, *Australian PC World* and *Macworld*; Brazil's *DataNews*, *MicroMundo*, and *PC Mundo*; China's *China Computerworld*; Denmark's *Computerworld/Danmark*, *PC World* and *Run* (Commodore); Finland's *Mikro*; France's *Le Monde Informatique*, *Golden* (Apple), *OPC* (IBM) and *Distributique*; Germany's *Computerwoche*, *Microcomputerwelt*, *PC Welt*, *Softwaremarkt*, *CW Edition/Seminar*, *Computer Business*, *Run* and *Apple's*; Italy's *Computerworld Italia* and *PC Magazine*; Japan's *Computerworld Japan*; Mexico's *Computerworld/Mexico* and *Compumundo*; The Netherland's *Computerworld Benelux* and *PC World Benelux*; Norway's *Computerworld Norge* and *PC Mikrodata*; Saudi Arabia's *Saudi Computerworld*; Spain's *Computerworld Espana*, *PC World* and *Commodore World*; Sweden's *ComputerSweden*, *Mikrodatorn*, and *Svenska PC*; the UK's *Computer Management*, *Computer News*, *PC Business World*, and *Computer Business Europe*; Venezuela's *Computerworld Venezuela*; the U.S. *Computerworld*, *Hot CoCo*, *inCider*, *Infoworld*, *MacWorld*, *Micro Marketworld*, *PC World*, *Run*, *73 Magazine*, *80 Micro*, *Focus Publications* and *On Communications*.

VIEWPOINT

The semantics of small computer systems

LECHT ON SCIENCE
Charles P. Lecht

Just in case you think this is an easy subject to tackle, try doing it yourself. I've tried to write this piece at least 15 times over the past three years, but I never got very far. I was unable to define what I, or anyone else for that matter, meant by a "small" system.

My hang-up was that I was trying to find some connection between the word "small" and the system's physical size, its power and its cost. I even considered its usage location as being possibly meaningful — for example, the human lap or the nonhuman desk top. But, I found that all these criteria, whether alone or combined, were wildly unsatisfying.

For example, it is possible to build a system with staggering computational capability that fits in a briefcase and, in quantity lots, costs less than an Epson America, Inc. PX-8. The system is built around a gallium arsenide logic chip — a favorite in our supercomputer community — that produces more than 1 million floating-point instructions per second and is connected to a megabyte of charge coupled device random-access memory (CCD RAM), with both encased in a microrefrigerator. It provides its user with immensely powerful vector processing power. Because the CCD RAM loses its data when the system is shut off, data could be saved in a laser disk memory unit that also fits in the briefcase.

No one would think of classifying that system as small; on the contrary, it qualifies for the title of supercomputer. If you have any doubts about this, try carrying it through U.S. customs inspection and announcing your intention to take it on holiday in Leningrad.

Not to despair, though, for at long last I think I've deduced what people must mean by a small system, and if I am correct, I judge the future of this systems technology to be as bright, if not brighter, than any technology under development today. In these days of computer industry slowdown, a little brightness may go a long way.

Without further delay, I offer my definition of a small system so that I can go on to relate why I think its future is so bright.

Definition of a small system

A small system is one that can't do too much, or if it can, it can't do it too fast. No one cares if you take it out of the country, even to the USSR. And that's that. This having been said, I would like to make a comment on programming that I will relate to small systems technology.

Let's face it, except for a very few, no users really want to program computers if they have anything better to do. It's a thankless, tedious task. In part, it derives from those natural and expected economic trade-offs that serve to establish the boundary where manufacturers' responsibilities end and users' responsibilities begin. In part, it derives from the blazing ineptitude of those scientists that make computer hardware/software.

It's clear to me that until recently, most of our high-technology computer systems design heroes hadn't a clue how the things they were making might be used. They went about making computing systems and labeled them "general-purpose," hoping that people who purchased them might know. The label suggested that their systems could do practically anything, but it masked the fact that they could do little of practical value — like process a payroll — without a laborious disabling of all those generalities that didn't apply and enabling the few that did for a specific application. This process is what is called "programming."

Thank goodness, in recent times, some firms that make computer systems show signs that their designers have finally figured out the purpose of their products. They switched to making special-purpose devices that are easily programmed to do the jobs we need done as we go about our daily chores, without causing us to worry about or research the mysteries of computer science.

Users are tired of buying general-purpose computer systems to do a few highly specific tasks. Soon to vanish are manufacturers of small systems that can do just about anything anyone wants but require that they learn things as basic as Basic to do them. In their places will emerge those manufacturers that produce systems that do very little but do it well and do it for anyone wanting it done. Possessing this capability, these devices should sell like hotcakes — now and in the near future. These are the small systems of the future.

In the business area, this might be a simple word processor that requires a lot less of the user who just wants to draft and edit letters or reports and doesn't care if the system can't do anything else. A large screen so users can see what they are typing, a reasonably quiet keyboard and those very few functions that allow nonprofessional typists to go at it would suffice.

Hardware and software that will one day allow systems to grow into full-fledged office machines — but at the cost of carrying around now superfluous, hernia-inducing devices and coping with small screens — won't sell any longer. Nor will a spreadsheet device that requires so much setup time that users are compelled to recharge their batteries before refilling their martini glasses on a flight between New York and Los Angeles.

The small systems manufacturing community cannot have missed the success of today's photography industry. Since it has begun packaging film (software) in user-friendly ways, putting the intelligence needed to take a picture into the camera and the film itself and creating cameras (hardware) that anyone can operate, sales have soared. I predict that sales of computer hardware and software will also soar if the newly emerging small systems manufacturing community follows suit.

Lecht is chairman of Lecht Sciences, Inc., a New York-based think tank specializing in computer and communications technologies.

Minimizing the flow of managerial memos

MANAGEMENT MATRIX
Walter F. Cuirle

When was the last time you heard the following statements: "Great idea. Send me a memo me on that." "Summarize that status report in a memo." "Let's see that in a memo, and we'll get moving on it." Just yesterday? This morning? It seems that wherever two or more managers gather together, there will surely be a request for a memo.

Why? The reasons vary. Perhaps the best is illustrated in the first example, a memo that establishes who originated a new concept. That's useful. Memos summarizing reports make life a little easier for everyone except the author, who usually winds up writing the memo.

The last example, "Let's see it in a memo, and we'll get moving," is unfortunately common. Generally, you will hear this kind of a request for two reasons. The first is that the requesters are trying to cover their . . . ah, let's say themselves. That's the memo as an undergarment.

The other, better reason is simple communication. If, for example, there is a change in a chain of responsibility or a revision in critical dates, and more people need to know than can be present at a meeting, then there is a need to put it in writing. Just for the purpose of simple, undistorted communication.

For the moment, let's just agree that every piece of paper generated for internal use is overhead, pure and simple, and as such is something that ought to be watched carefully and minimized.

Managing without memos

Is it possible to manage without memos? Yes, depending on the size of the project and the size of the work group.

Look at the simplest case: if one manager directs one person to do one job that takes one day, is a memo necessary to get started? It doesn't seem so. How about one person, one week? Still not big enough. One person, one month? Probably not.

Let's increase the number of people. If you are supervising five people on a one-month project, do you have to direct the project and communicate its status to them in writing? It's doubtful. You certainly talk to each other — you work together, remember? Brief, periodic meetings will handle the status and direction of the project more effectively and in less time than it would take to do it in writing. In short, it's cheaper.

Those are really the deciding factors — time and effect. There's a certain minimum amount of time required to turn out paper; let's say two hours. If the group is small enough and the project is short enough that you can communicate status and direction face-to-face in less than two hours, then memos are less effective than meetings.

On the other hand, just because it takes a minimum of two hours to turn out a one-page memo doesn't mean it takes six hours to turn out three pages. If the project is so complex that it would take a three-hour meeting to cover all the points, or so many people are involved that it would require two meetings to talk to them all, then it is probably more economical to put it in writing.

This implies that the economy of managerial memos is an economy of scale. In situations like this, the obvious question is, where's the break-even point? When are memos and meetings equally economical?

Effective group communication is a book-length topic in itself. But communications start to break down when a group is larger than 10. A group of 15 people, for example, can be either a cocktail party or a classroom lecture but not a particularly effective discussion group.

Measuring project complexity

Complexity measured in terms of the length of a project is a little more difficult to calculate, but go back to the one-person, one-job, one-month example for a handle on it. That one-month project is going to be divided into discrete steps.

Can you handle 10 to 15 related topics every week, in less than your minimum memo time of two hours? You probably can. So that's the break-even point.

You can repeat the analysis using numbers that fit your operation, but you get the idea. For the figures we have here, the break-even point is 10 people working together on a one-month project. You can handle that or anything smaller in weekly meetings. Don't bother writing until it gets bigger.

SAS Institute Inc. Announces

Lattice C Compilers for Your IBM Mainframe

Two years ago...

SAS Institute launched an effort to develop a subset of the SAS® Software System for the IBM Personal Computer. After careful study, we agreed that C was the programming language of choice. And that the Lattice® C compiler offered the quality, speed, and efficiency we needed.

One year ago...

Development had progressed so well that we expanded our efforts to include the entire SAS System on a PC, written in C. And to insure that the language, syntax, and commands would be identical across all operating systems, we decided that all future versions of the SAS System—regardless of hardware—would be derived from the same source code written in C. That meant that we needed a C compiler for IBM 370 mainframes. And it had to be good, since all our software products would depend on it.

So we approached Lattice, Inc. and asked if we could implement a version of the Lattice C compiler for IBM mainframes. With Lattice, Inc.'s agreement, development began and progressed rapidly.

Today...

Our efforts are complete—we have a first-rate IBM 370 C compiler. And we are pleased to offer this development tool to you. Now you can write in a single language that is source code compatible with your IBM mainframe and your IBM PC. We have faithfully implemented not only the language, but also the supporting library and environment.

Features of the Lattice C compiler for the 370 include:

- **Generation of reentrant object code.** Reentrancy allows many users to share the same code. Reentrancy is not an easy feature to achieve on the 370, especially if you use non-constant external variables, but we did it.
- **Optimization of the generated code.** We know the 370 instruction set and the various 370 operating environments. We have over 100 years of assembler language systems experience in our development staff.
- **Generated code executable in both 24-bit and 31-bit addressing modes.** You can run compiled programs above 16 megabytes in MVS/XA.
- **Generated code identical for OS and CMS operating systems.** You can move modules between MVS and CMS without even recompiling.
- **Complete libraries.** We have implemented all the library routines described by Kernighan and Ritchie (the informal C standard), and all the library routines supported by Lattice (except operating system dependent routines), plus extensions for dealing with 370 operating environments directly. Especially significant is our byte-addressable Unix®-style I/O access method.
- **Built-in functions.** Many of the traditional string handling functions are available as built-in functions, generating in-line machine code rather than function calls. Your call to move a string can result in just one MVC instruction rather than a function call and a loop.

In addition to mainframe software development, you can also use our new cross-compiler to develop PC software on your IBM mainframe. With our cross-compiler, you can compile Lattice C programs on your mainframe and generate object code ready to download to your PC.

With the cross-compiler, we also offer PLINK86™ and PLIB86™ by Phoenix Software Associates Ltd. The Phoenix link-editor and library management facility can bind several compiled programs on the mainframe and download immediately executable modules to your PC.

Tomorrow...

We believe that the C language offers the SAS System the path to true portability and maintainability. And we believe that other companies will make similar strategic decisions about C. Already, C is taught in most college computer science curriculums, and is replacing older languages in many. And almost every computer introduced to the market now has a C compiler.

C, the language of choice...

C supports structured programming with superior control features for conditionals, iteration, and case selection. C is good for data structures, with its elegant implementation of structures and pointers. C is conducive to portable coding. It is simple to adjust for the size differences of data elements on different machines.

Continuous support...

At SAS Institute, we support all our products. You license them annually; we support them continuously. You get updates at no additional charge. We have a continuing commitment to make our compiler better and better. We have the ultimate incentive—all our software products depend on it.

The competition...

If you would like to compare, the other vendors of 370 C compilers are: AT&T, Whitesmiths, Ltd., WATCOM Products Inc. (CMS only), Oracle Corp., Amdahl Corp. (UTS only), and IBM Corp. (VM/IX only). We think you will choose the Lattice C compiler from SAS Institute.

For more information...

Complete and mail the coupon today. Because we've got the development tool for your tomorrow.

SOFTWARE & SERVICES

AN INTERVIEW

Dr. Sundstrom

As the backbone of its communications strategy, IBM's Systems Network Architecture (SNA) has long been the focus of public attention. But a 1982 addition to SNA has in recent days caught the eye of users and software vendors and, by Big Blue's own admission, become a subject of intense interest in the corporate offices of IBM.

Logical Unit Type 6.2 (LU6.2), dubbed Advanced Program-to-Program Communications, is an SNA protocol that allows software programs to communicate — regardless of their hosts — on a peer-to-peer basis. LU6.2 has been touted as the key to advances in micro-mainframe linkage and distributed processing. The protocol has been implemented in a limited but growing number of IBM products and has been embraced by third-party software vendors. Computerworld Senior Editor Software, John Gallant, talked about the future of LU6.2 with Robert Sundstrom, manager of communications systems architecture with IBM's Communications Products Division in Raleigh, N.C.

Why has it taken so long for manufacturers and users to recognize the significance of LU6.2?

Things like this take time. SNA is celebrating its 11th anniversary. But back in 1974, it wasn't as big a deal as it is today. Before LU6.2 becomes really exciting, it needs to be implemented on a wider variety of products. It won't have a really major impact on our customers until they start installing those products.

It has been said that LU6.2 allows a user to retrieve data without knowledge of where that data resides and execute

CICS test program praised, but users balk at price hike

By Charles Babcock
CW New York Bureau

NEW YORK — Early users of an IBM CICS applications testing program said its automated procedures save manpower, but some of them are disputing its $25,000 to $35,000 price.

The program, Verify, now a product of On-Line Software International, Inc. of Fort Lee, N.J., is being used by Manufacturers Hanover Trust Co., Equitable Life Assurance and Shearson Lehman Brothers, Inc., all in New York, and Allis-Chalmers Corp. in Batavia, Ill., to test CICS application programs after they have been modified, spokesmen for the companies said. The users praised the product, but at least two of them questioned On-Line Software International's decision to increase Verify's price tag by more than 300%.

"We have had it for roughly a year now, and we are using the 'be-jeepers' out of it," said John Haab, manager of systems service at Allis-Chalmers. He said Allis-Chalmers has not yet quantified the manpower Verify has saved it in automatically running test data, but he said the gain is significant.

Verify is "a viable, regression testing tool," said Richard Wysocki, assistant manager of technical services at Equitable Life.

All four users agreed the program addressed a need that in the past could only be met through the tedious manual reentry of test data or through more cumbersome competing packages that added steps to the testing process.

Verify uses hooks into the IBM Terminal Control Program to capture test data as it is entered into an application and stores

ELECTRONIC MAIL COMMUNICATION CENTER

Lightyears Ahead . . .

The ONE electronic mail product that links all major operating environments: MVS, VSE, VM, CMS, CICS, TSO, ACF...

Emc² is easy to use. It's designed to get the mail moving *fast*.

Emc² functions as a super-efficient ACF/VTAM application. This allows literally thousands of people in your company to use mail without needing TSO, CICS, or CMS user IDs!

Emc²

CICS CMS ACF TSO

- Full-screen menus and help panels
- Scrollable inbaskets and outbaskets
- Uncomplicated text entry
- Mailing lists
- Bulletin boards
- Calendar features
- Timely Reminders "tickler file" (arrange for messages to be sent at some future date)
- Automatic new-mail notification
- Mail classes (partition Emc² into virtually separate mail systems)
- Efficient data base storage
- Simple installation
- Low administrative overhead
- Application programming interface

PLUS
- Electronic mail *networking* between mainframe sites
- *Integrated PC support* and integrated PC file transfer

Wang net package controls VS software inventory

LOWELL, Mass. — Wang Laboratories, Inc. has announced a network administration package for multisystem VS environments.

According to a spokesman, the Software Manager is integrated into Wang's Distributed Management Facility and allows for the control of software inventories from a central site. With the package, users can electronically distribute software to remote sites through the File Transfer Service and Forward Service in a Wang Systems Networking (WSN) environment. Software Manager can also be used to install software automatically on remote systems and to manage applications at the remote site.

The Software Manager requires Release 6.2 or higher of the VS operating system, VS WSN transport releases and WSN File Transfer Service for network distribution.

The software is priced at $1,250 for a perpetual license on the VS 15, VS 25, VS 45, VS 50, VS 65 or VS 80 and $5,000 for a perpetual license on the VS 85, VS 90, VS 100 and VS 300.

Wang Laboratories is located at One Industrial Ave., Lowell, Mass. 01851.

SOFTSCOPE

Notes from the software industry front

Alpharetta, Ga.-based Digital Communications Associates, Inc. said that its Irma's Fastlink high-speed modem is supported by Atlanta-based Management Science America, Inc.'s Expert Link microcomputer-to-mainframe link. Irma's Fastlink transfers data at speeds of up to 10K bit/sec. A spokesman said the coupling of the products allows micro users to send downloaded host data to other micros in remote locations at high transmission speeds.

■

Digital Equipment Corp. of Maynard, Mass., has contracted with New York-based Coefficient Systems Corp. to distribute Coefficient's Vterm II communications software through the Digital Distributed Software program. Vterm II is said to allow IBM Personal Computers, Personal Computer XTs and ATs to communicate with DEC VAX and PDP minicomputers. It offers terminal emulation, five file transfer protocols and other general communications capabilities.

■

Digital Equipment Corp. also entered into an agreement with Philon, Inc. of New York that will make Philon's compilers available for DEC's Microvax I and Microvax II under DEC's Ultrix version of AT&T Unix. Philon will supply its Fast/Compilers to DEC under the Digital Classified Software (DCS) program. The DCS program tests third-party software to ensure that it meets DEC specifications.

■

American Channels, Inc. of Lexington, Mass., announced that it will republish internationally developed computer-aided design and manufacturing software packages for the U.S. The company's first products, originally published in Europe by Cadcentre Ltd. of Cambridge, England, include AC/GNC, a graphics-based numerical control tape preparation system; AC/Diad, a mechanical drafting and design system; and AC/Plan, a computer-aided planning package. The products form the core of American Channels' Shop Floor CAD/CAM product line.

■

Westford, Mass.-based American Business Systems, Inc. will supply its Business Accounting Control Systems (Bacs) Software for Pennsauken, N.J.-based Datamedia Corp.'s recently announced AT&T Unix-based 932 Supermicros. The joint marketing agreement covers the entire Bacs line of general ledger, payroll, accounts payable and receivable and order and inventory packages.

■

Management and Computer Services, Inc. (Macs) of Valley Forge, Pa., and Applied Information Development, Inc. (AID) of Oak Brook, Ill., formed what the two companies called a joint business alliance aimed at assisting clients in software testing and quality assurance. Under the pact, the Macs automatic test data generator, Datamacs, and the Tracmacs audit path analyzer will be brought into client sites by AID to carry out specific testing and quality assurance arrangements.

■

Carleton Corp. of Cambridge, Mass., signed a distribution agreement with Honeywell Information Systems of Phoenix. Honeywell Information will market Carleton's Auditec information retrieval, reporting and auditing software for its DPS 8, DPS 88 and DPS 90 processors under the Gcos 8 operating system.

■

AT&T Information Systems has contracted with Syntactics Corp. to distribute, co-label and publish the Crystalwriter package for its 3B2, 3B5 and Unix PC 7300 computers. Crystalwriter is Syntactics' AT&T Unix-based word processing package for multiuser environments.

MANY UNIX-BASED SYSTEMS—ONE UNIX TRAINING COMPANY

Three factors make the Computer Technology Group the experts in UNIX and 'C' language training:

- Experience, through training thousands of students worldwide in live seminars, with thousands more using our video training at their locations.
- Extensive Curricula Supporting All UNIX Versions, creating a client base of manufacturers, software developers and end users.
- Quality of Instruction, with instructors and course developers who are experts in teaching UNIX and 'C', as well as in designing and implementing a variety of UNIX-based systems.

COMPUTER TECHNOLOGY GROUP
Telemedia, Inc.

Introducing seven different ASCII displays...

The new IBM 3161 ASCII Display Station is really seven different ASCII displays in one.

In addition to its own function-rich native mode, the new IBM 3161 can emulate:

- IBM 3101 Model 881
- ADDS Viewpoint*
- Hazeltine 1500*
- Lear Siegler ADM-3A*
- Lear Siegler ADM-5*
- TeleVideo 910*

Besides fitting nicely into existing systems, the IBM 3161 also offers impressive improvements in ergonomics.

Improved Ergonomics For Improved Productivity

Take the 102-key ASCII-style keyboard, for example. Its low profile, gentle contour and typewriter touch make for faster keying with fewer errors. The keyboard has programmable function and editing keys so it can be custom-tailored to meet your application needs.

Then, for comfortable viewing, there's the tilt and swivel of the 12" display. And the sharp, clear 8 x 16 character matrix for easy reading. Plus cursor, character and field attributes (blink, reverse video, underscore, dual intensity, etc.). And scrolling. And partitioning. And lots more.

The IBM 3163 with Plug-in Cartridge

And, as if that weren't enough, we're also announcing a second new ASCII display station with even higher function—the IBM 3163.

The sharp 8 x 16 character matrix helps make for easier reading and fewer operator errors.

Outwardly, these two new displays look alike. But the 3163, in addition to its built-in emulation of the IBM 3101 Model 881, also offers the ability to emulate the DEC VT 52 and VT 100* by means of a unique plug-in cartridge.

And while you'll like the power and flexibility of the 3161, for your high-function applications the 3163 goes even further. For example, a 7,680-character buffer and up to three windows enable you to view and modify portions of different host data bases. The 3163 lets you redefine and even recap the keys.

On both displays the setup is menu-guided and written in plain English, so it can be done easily and quickly. The point is, both are designed to improve your user productivity.

Very Attractive Prices

The price per terminal is $695 for the 3161 and $1,095 for the 3163. Quantity discounts are available. What's more, IBM maintenance offerings start as low as $35 per year per terminal for customer carry-in repair.

Now there's a new family of ASCII displays with the quality, service and support IBM is famous for. Both displays are available through IBM Authorized Distributors and IBM marketing representatives.

FEATURES	3161	3163
Lines x Characters	25 x 80	25 x 80
Double-sized chars	No	Yes
Line drawing chars	24	24
Vertical scroll	Jump	Jump/ Smooth
Definable function keys	24	24
Windowing	No	Yes
Partitioning	Horiz	Vert/Horiz

Call 1 800 IBM-2468, Ext. LE/90 for the name of an Authorized Distributor near you.

Soft-Switch upgrades Profs interface

Dissimilar systems now able to exchange data

KING OF PRUSSIA, Pa. — The capability to exchange notes and final-form documents between the IBM Professional Office System (Profs) office automation system and dissimilar office systems has been added to Soft-Switch, Inc.'s Profs Bridge II interface.

Previously, the Soft-Switch Profs interface allowed users of non-IBM office systems to exchange only revisable-form documents with Profs users in IBM VM environments. IBM's Profs includes electronic mail, calendaring and document preparation capabilities.

The Soft-Switch interface now allows users of systems from Wang Laboratories, Inc. and Xerox Corp. to send and receive notes to and from Profs users.

Documents from a Wang system that are intended for Profs users are automatically formatted into Profs notes and final-form documents and appear as a normal Profs incoming mail item to Profs users, the vendor said.

Profs Bridge II also supports Generalized Mark-Up Language in final-form documents, and includes a revised addressing scheme.

The Soft-Switch interface supports the IBM Personal Computer, Final Form Print Image, IBM's Document Control Facility, Displaywriter, Displaywrite 2, Displaywrite 3, IBM's 5520 terminal and the 6640 and 6670 Laser Printers. It also supports NBI Corp.'s Oasys 8, Oasys 64, 3000 and 4000 systems, the Wang Office Information System and VS systems, Xerox's 850/860, and Multimate International Corp.'s Multimate word processing package on the IBM Personal Computer.

The Profs Bridge II is priced at $20,000.

Additional information is available from Soft-Switch, which is located at 200 N. Warner Road, King of Prussia, Pa. 19406.

Centre info manager out

REDWOOD CITY, Calif. — Advanced Relational Technology, Inc. has announced the Centre Information Management System, a fourth-generation applications development system for Prime Computer, Inc. 50 series minicomputers.

Centre is upwardly compatible with Advanced Relational Technology's Relgraf Information Management System, the Prime version of which is being discontinued.

The Centre system is based on Advanced Relational Technology's proprietary relational data base management system (DBMS) technology, which includes a compiled query language and special-purpose file system. The Centre system was built around a relational file management system with its own buffer management, recovery and transaction support. This feature is said to speed data retrieval and improve host performance by reducing disk I/O.

The applications development system includes a report writer, full screen forms management and Advanced Relational Technology's nonprocedural language based on SQL.

Release 3 of Centre, including full screen forms management, report writer and fourth-generation applications development languages, together with the Centre relational DBMS, is priced at $37,500 for a license on the Prime 9650, 9750 and 9955 processors. On the Prime 2250 and 2550 processors, the price is $22,000.

Advanced Relational Technology is located at Suite 306, 702 Marshall St., Redwood City, Calif. 94063.

Apollo graphics software debuts

CHELMSFORD, Mass. — Apollo Computer, Inc. has announced that three-dimensional graphics software modeled after the emerging Programmer's Hierarchical Interactive Graphics Systems standard, is now available for its Domain workstations with the SR9 release of Apollo's Aegis operating system.

The Graphics Metafile Resource (GMR) facility is said to offer full 3-D functionality, including interactive scaling and rotation, complex viewing, interactive editing, drawing and displaying of objects.

The graphics metafile feature of GMR is an editable, tree-structured data base that can be shared among applications and viewed on any Apollo workstation on the distributed Domain network. The metafile can be stored and redisplayed, revised and reused at any time, a spokesman said.

The GMR will become standard on all Domain workstations, including the recently announced DN330 and DN560 models, with the updated Aegis operating system. The GMR is also compatible with Domain/IX, the company's implementation of AT&T's Unix System V and University of California at Berkeley 4.2 Unix.

Apollo is located at 15 Elizabeth Drive, Chelmsford, Mass. 01824.

The Right Information at the Right Time... at No Charge to You from Comdisco

Now Available On Cassettes!

Our Comline Reports have proved so popular, we put the latest issues on cassettes. Now you can keep current at your convenience. . .at home, in the car, or wherever your busy schedule takes you. On tape or in print, Comline Reports will keep you up-to-date on the issues that impact your company, your data center, and your equipment planning decisions.

The Information Crunch

Today's data processing professionals are required to be practiced technicians, inspiring managers, and masters of all that's new and current. Responsible for day-to-day operations as well as keeping management informed of the big picture, it's no wonder that DP managers have little time for in-depth analyses of critical industry issues.

The "COMLINE" Solution

Comdisco's Comline Reports are a means through which industry professionals can take advantage of the experience and information which flows through our technical, financial, and marketing channels. Authored by Comdisco's Professional Resource Team, Comline Reports are loaded with valuable insights to help you manage your operation more successfully in today's changing DP environment.

Why Comdisco?

Comdisco is the world's largest remarketer of IBM computers and peripherals, and has consistently set the standard of excellence in the computer leasing industry since 1969. Today, our role in the industry as authorities and advisors on data processing topics has expanded dramatically. From financial issues . . .to capacity requirements. . . to compelling disaster recovery obligations. . . Comdisco professionals are making the effort to keep you informed of the issues. To thousands of Comdisco customers, our name and our standard of quality service is second nature. To those of you who would like to learn more about the expanding scope of our services, as well as subscribe to our Comline Reports, we invite you to clip the coupon below.

Announcing Masterpiece™: A Powerful Mainframe Application Software Product Built Upon A Simple Idea Called Intelligent Architecture™.

What do you call a mainframe application software product designed with such patient attention to detail that it will register the effects of one transaction on every other business transaction in a company?

What do you call software architecture so artfully conceived it will someday enable a person using an application to move from one database management system to another, or from one teleprocessing monitor to another, without a single change in his work style?

What do you call query and reporting tools so simply and powerfully rendered that even a novice will find them no more difficult to work with than a personal computer spreadsheet?

Only one name fits…

Introducing Masterpiece.

The Masterpiece series is a family of mainframe business software products—a classification and a category which may lead you to conclude that it is like other mainframe software products.

Don't leap to that conclusion.

The Masterpiece design is so clean and uncluttered that it makes current and future applications efficient to develop and easy to use. Masterpiece comes with none of the excess baggage, inherent short-comings or system limitations that have traditionally plagued the people who need business information and the people who manage it.

Masterpiece is, in every aspect, a new family of software products.

And, in every aspect, an *improvement* over the software packages you may be used to.

Or are, in fact, now using.

Intelligent Architecture Design: The Fundamental Difference.

Previous software designs have been developed to better utilize the power of the computer.

Masterpiece was designed to mirror the methods and styles of the work place and to anticipate the *inadequacies* of the computer.

Masterpiece design is called Intelligent Architecture. It's a new term. And a new way to build software. Now, Intelligent Architecture brings new meaning to concepts like "modularity," "borderless integration" and "event-oriented processing."

Only application-specific code is contained in the application…other coding (system code, interfaces, code common to multiple applications) is separated out and coordinated by the Intelligent Architecture itself.

This means that ultimately a user can adopt a new database management system without the slightest change in either his way of working or in the application code itself.

Only software built in this manner, is software that will endure.

The Intelligent Architecture design means that all menus and screen prompts become common to all Masterpiece applications. It means that the way users interact with an application will be the same from application to application—a significant factor contributing to greater ease-of-learning and ease-of-use.

It is this capacity, present now in the Masterpiece Intelligent Architecture design, that lifts Masterpiece beyond the promise of other software products in its class.

And *that* is the fundamental difference.

Masterpiece is a trademark of Software International Corporation. Intelligent Architecture is a trademark of Software International Corporation. MasterQuery is a trademark of Software International Corporation. MasterSecurity is a trademark of Software International Corporation.

Masterpiece: Common Functions.

The reason Masterpiece works so well is because each of its pieces work so well together.

And apart.

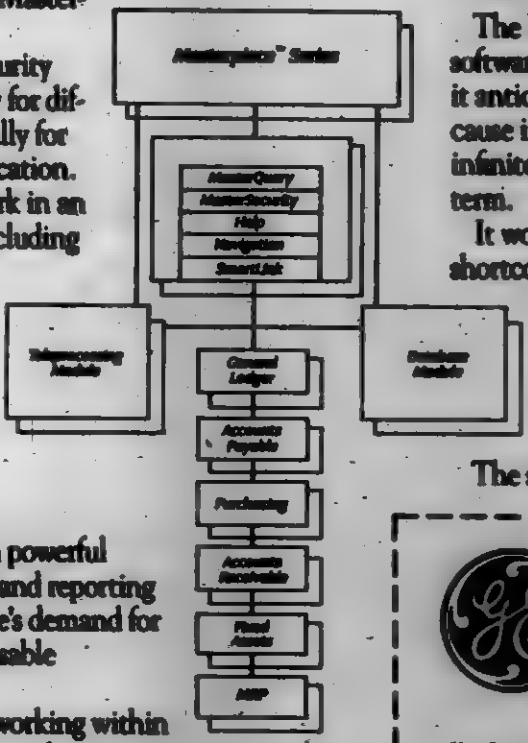
The MasterSecurity™ system, Online Help and Navigation features work across (and are common to) all Masterpiece applications.

But because they are separate from all applications, Online Help, for example, can be custom modified or even translated into different languages.

The Navigation feature lets you move from screen to screen with direct access from one Masterpiece application to another.

Levels within the MasterSecurity system can be determined not only for different applications but set specifically for transactions within the same application.

Everything is designed to work in an intelligent and modular fashion including what may now be the industry's most advanced query tool . . . MasterQuery.™



MasterQuery System.

The MasterQuery system is a powerful fourth generation borderless query and reporting tool designed to satisfy an executive's demand for instantly accessible and instantly usable information.

MasterQuery gives a person working within one application the ability to access information from another (accounts payable while working on general ledger, for instance) and to merge information from separate applications in a single report.

It also gives that person the ability to arrange his information in whatever form, format, or fashion he chooses. In whatever sequence or order. With whatever computations or projections he wants to make. With only the barest bit of computer know-how.

Masterpiece Integrated Applications.

The Masterpiece series will include these fully integrated, functionally rich business applications: General Ledger, Accounts Payable, Purchasing, Accounts Receivable, Fixed Asset Accounting, and MRP software products.

Masterpiece: The Promise The Future Holds.

The Masterpiece series is truly "built from the ground up" software. Because its architecture is so well thought through it anticipates future enhancements and applications. Because it's a product designed to be completely modular and infinitely *improveable* it represents a real value over the long term.

It won't, in short, fall prey to technological or design shortcomings. Won't dead-end at some point. Won't fail to perform as your needs expand.

For a Masterpiece demonstration, clip the coupon below or call toll free 1-800-343-4133 (in Massachusetts, call 1-800-322-0491) and arrange to attend a Masterpiece executive briefing.

The sooner you call, the further ahead you'll be.

SYSTEMS SOFTWARE

■ Business Controls Corp. has announced a split-screen editor for multifile editing on Digital Equipment Corp. VAX-11 minicomputers.

The Splits package reportedly allows character editing on one file while viewing a second file. The software allows the top half of a terminal screen to display the viewed file with full search and scan capability, while the bottom half contains the file being edited, with full character editing capability.

Splits is said to conform to all DEC EDT conventions, using keypad and function keys similar to EDT.

The cost of Splits is $500.

Business Controls, 3-7 W. First St., Clifton, N.J. 07011.

■ Mid-States Computer Corp. has announced Remote Program Support (RPS) communications software for IBM System/34 and System/36 minicomputers.

RPS is said to allow users to transfer library members, OCL job streams, spool entries and data files between System/34 and 36 processors via dial-up telephone lines. With RPS, users can execute a job stream at the receiving location that was created at the sending location.

RPS costs $900 with a $100 charge per additional CPU. A site license costs $1,800.

Mid-States Computer, P.O. Box 1564, Grand Island, Neb. 68802.

■ New Generation Software, Inc. (NGS) has announced Disksaver/38, a disk space maximization tool for the IBM System/38.

NGS reportedly allows users to reduce the sizes of object libraries by up to 60%. It allows users to limit their on-line storage to the part of the object code needed in normal program operation. It also can reorganize data base files, the vendor said.

The file reorganization system reportedly enables users to reorganize files in all libraries, all files in a single library or selected files in a library.

Disksaver/38 is priced at $985.

NGS, 3840 Rosin Court, Sacramento, Calif. 95834.

■ Specialized Systems Consultants, Inc. has introduced a C Cross Compiler package for Digital Equipment Corp.'s VAX family, Sun Microsystems, Inc. workstations, AT&T's Personal Computer 6300 and Plexus Computers, Inc. micros running the AT&T Unix operating system.

The product allows programmers to write and debug programs in the C language on a Unix-based host and then cross-compile the program to the target microprocessor.

The C Cross Compiler package includes separate compilation and linking capabilities and an embedded assembly language.

It is priced at $3,500.

Specialized Systems Consultants, P.O. Box 7, Northgate Station, Seattle, Wash. 98125.

PRODUCTIVITY AIDS

■ Intelligent Information Systems, Inc. (IIS) has announced IIS/Destiny, an applications development system for users of Digital Equipment Corp. VAX computers.

IIS/Destiny includes a development language, a query facility with report-generation capabilities, a data dictionary and a data base management system that supports relational, network and hierarchical data base models, the vendor said. IIS/Destiny reportedly speeds the development of applications and can reduce applications maintenance.

IIS/Destiny is priced from $29,500 for the VAX-11/730 to $69,500 for the VAX 8600.

Intelligent Information Systems, 90 West St., New York, N.Y. 10006.

■ Help/38 Systems has introduced a productivity package for the IBM System/38.

Easy View reportedly allows users to display and correct System/38 files without programming and allows them to locate and fix programming bugs. Users can check update programs in test mode and create test data base files without programming, according to the vendor.

Easy View is said to be able to convert record contents into four formats: the Hex Display format displays field names beneath corresponding strings of hex code; EZ-Field formats records, placing field headings on the left and values unpacked and edited on the right; Composite Display displays fields selected; and EZ-Field Composite allows field values to be displayed, unpacked and edited next to their headings.

Easy View costs $850 per CPU.

Help/38 Systems, 15102 Minnetonka Industrial Road, Minnetonka, Minn. 55345.

■ Oceanic Information Systems, Inc. has released fourth-generation systems development productivity tools for IBM mainframes in OS, DOS and CMS operating environments. The products were designed for use with the company's Extracto nonprocedural data management and report writer tool.

Compiler/XL is said to allow Extracto users to select between an interpretative mode or a compiled mode. The product can scan control blocks and generate and execute machine code. It costs $20,000.

Screen Power/XL allows users to develop interactive programs under CICS, TSO or with Cullinet Software, Inc.'s IDMS-DC data base manage-

NOW IT ONLY TAKES ONE TO TANGO.

Say hello to PhoneMail™ and say hello to the One Party Phone Call. No more waiting for the phone to ring, waiting for someone on the other end, waiting for your telephone partner in another city, another meeting, another time zone. Waiting.

PhoneMail is not your basic phone answering gadget.

It's a digital voice-messaging system for your entire company that you can access from any Touch Tone* telephone anywhere in the world, any time.

PhoneMail can answer your phone with your personal greeting. (If you'd prefer, your secretary can take the call and direct the caller to PhoneMail.)

It will let you answer messages automatically. It can forward them, along with your comments, to dozens of your associates. It lets you send messages to a whole roster of

SOFTWARE & SERVICES

ment system. Users can request a variety of different screen formats. Each of these screens permits users to enter new data for automatic validation. Data entered by the user can be used to direct processing, read records, modify or rewrite a record or create a file. Screen Power/XL will be available in September for a price of $6,200.

Link/XL is Oceanic's licensed version of Micro-Tempus, Inc.'s Tempus Link micro-mainframe communications product. When used under Extractor and in conjunction with the IBM Personal Computer line, Link/XL uses Micro-Tempus' virtual diskette technology to allow users to read and write files residing on the mainframe. The base price for the Link/XL is $6,200.

Oceanic Information Systems, Middlesex Technology Center, 900 Middlesex Tpk., Billerica, Mass. 01821.

APPLICATION PACKAGES

■ **Skantek Corp. has introduced optical character recognition (OCR) software for its engineering drawing scanner.**

A spokesman said the SK 401 software reads and digitizes hand-lettering and printed text. The software is said to reduce the storage needed for computer-aided design and engineering systems.

With OCR capabilities, a drawing's text and graphics can reportedly be read simultaneously. The scanned data is then converted into Ascii-format International Graphics Exchange Standard files.

The SK-401 OCR software is priced at $25,000.

Skantek, 150 Mt. Bethel Road, Warren, N.J. 07060.

■ **Honeywell, Inc. has introduced Release 1.2 of its Magnetic Ink Character Recognition (MICR) Plus II used with Honeywell document handlers for banks and financial institutions.**

According to a spokesman, MICR Plus II Release 1.2 eliminates the need for magnetic tape on Honeywell document handlers and includes capabilities for producing co-mingled cash letters, accepting non-MICR input and making automatic adjustments to cash letters. A Cash Letter Adjustment feature permits automatic generation of reports that list changes to cash letter content because of corrections made in on-line balancing procedures, a spokesman said.

The annual primary license fee is $3,306 with an initial license fee of $12,500.

Honeywell, 200 Smith St., Waltham, Mass. 02154.

■ **Software Express has released a directory of vertical market AT&T Unix applications that have been developed with the company's Appgen application generator.**

Each of the vertical market packages runs on a range of computers including the IBM Personal Computer AT and Amdahl Corp. mainframes.

The directory is available for $10.

Software Express, 2925 Briarpark Drive, Houston, Texas 77042.

■ **Silver-Lisco, Inc. has announced Version 5 of its Schematic Design System (SDS) software for computer-aided engineering. The company also announced that its Design Capture System, including SDS Version 5, is now available for Digital Equipment Corp.'s Vaxstation I and Vaxstation 100 workstations.**

According to a spokesman, the Computer-Aided Schematic System (Cass) within SDS Version 5 now supports up to 10 schematic windows, permitting multiple windows to be opened onto a single schematic. Different portions of the windows can be displayed and users can move between windows.

The Design Capture system, including SDS Version 5, costs $10,000.

Silver-Lisco, 1080 Marsh Road, Menlo Park, Calif. 94025.

■ **Mentor Graphics Corp. has announced the Msimon software simulation package for use in simulating Cmos and MOS very large-scale integration devices. The software runs on Mentor Graphics workstations.**

NIES

from page 45

that evaluate systems supplied by vendors other than IBM. Nies said Cincom surveyed 60 users of its data base management system and an equal number of IBM IMS DBMS users.

The study indicated that Cincom's users had all reviewed a variety of products before selecting their DBMS. The 60 IMS users, on the other hand, had not considered anything but the IBM product.

IMS fares poorly against independents

As Nies put it, Cincom's sales don't come out of IBM's hide unless there is a product evaluation. Nies said that, where there is a product review, IBM's products consistently fare poorly against the independent offerings.

> *'The computer industry is slowing down because of the problems involved with software development.'*
>
> — David Banks
> Cadre Technologies, Inc.

"IBM is generally unchallenged, except when there is an evaluation," Nies said. "When Cincom wins, it is against the independents.

"Unless our products are better, unless our service and support is better than IBM's, we have no chance to win. All things being equal, we would lose. We have to be substantially better to win, provided there is an evaluation at all."

Nies' comments are enlightening in view of the strides the independent software vendors have made in recent years, especially in DBMS — a market that is of only slightly less importance to IBM than operating systems, wherein Big Blue holds most, if not all, of the cards. Though IBM still controls roughly two-thirds of the DBMS market, the independents continue to tear away chunks of its market lead.

Most analysts readily state that the independent vendors' DBMS products are more advanced than IBM's offerings, especially the sophisticated fourth-generation languages and other productivity tools the independents offer in conjunction with their DBMS. But you cannot play to win if you don't know where the game is being held.

■

"The computer industry is slowing down because of the problems involved with software development," according to David Banks, president and chief executive officer of Cadre Technologies, Inc.

Banks has a good point, and it is one that an increasing number of companies are taking to heart. Cadre is part of the growing corps of firms offering workstation-type systems that address either the design or analysis phases of the software development life cycle.

Specifically, Cadre's Teamwork/Systems Analysis (SA) is a turnkey system aimed at the requirements analysis phase — a phase that Banks said comprises roughly 35% of the software development life cycle. Currently hosted on multiuser Apollo Computer, Inc. systems, Teamwork/SA embodies what Banks called a structured analysis methodology designed to speed the drafting of accurate and complete analysis models that can later be used in the design phase.

A single-user version costs about $35,000, and a multiuser version costs roughly $42,000 per node.

According to Banks, the structured analysis procedure, while recognized as vital to the development of quality systems, is so tedious when done manually that many organizations bypass it entirely. As a result, Banks is quick to point out, completed systems don't meet end-user needs, if the system is completed at all, and the ensuing maintenance workload is increased exponentially.

He said research has shown that approximately two-thirds of system bugs can be traced to errors and misconceptions in the design and analysis phases rather than coding mistakes.

Yet most of the automation efforts in software design have been aimed at the coding phase — perhaps the smallest portion of the development life cycle.

Cobbler's children last to get shoes

Banks said one of the biggest problems fledgling Cadre faces in promoting Teamwork/SA is trying to convince MIS managers in the corporate world of the value of investing in such workstation products for programmers. Banks called it a case of the cobbler's children being the last to get new shoes.

He said management in industries such as aerospace, engineering and defense is more easily sold on the concept, having had good experiences with workstation products for computer-aided design, manufacture and engineering.

The increasing attention to tools that aid in software development is encouraging. But Banks' comments also indicated that it may be some time before mainstream DP shops begin to implement the technology on anything but an exploratory basis. It is ironic that software developers may be one of the last groups to benefit from the fruits of their own labor.

4 out of 5 artists recommend Impressionist™.

Take it from the experts. When you have to impress the best, you need the very best impression. And the best impression comes with Impressionist, EXECUCOM's new business graphics software package. It can make anybody a presentation genius.

Impressionist is the only presentation graphics system designed to run on corporate mainframes, departmental minis and micro workstations—with the same commands and functions for each environment. Using Impressionist and a plotter, printer or high resolution camera, you can produce bold, imaginative graphics. Market trends, sales projections, inventory cycles, business strategies and financial forecasts will come alive before your audience.

Using Impressionist is as simple as putting brush to palette. It can be menu or command-driven for impromptu creations or automatically driven for production of frequently needed graphs. Draw upon the powerful graphics editor to draw *free-form*. Best of all, Impressionist's chartbook contains over 100 preformatted charts, and it's compatible with CueChart™ from ISSCO.

Impressionist can easily be accessed by both micro *and* mainframe users. It accepts data from any ASCII file as well as from other talented contemporaries. Like Lotus 1-2-3™ and Multiplan®. Or IFPS®, EXECUCOM's powerful Decision Support System.

Turn a few keyboard strokes into boardroom strokes of presentation genius. With Impressionist. From EXECUCOM, number one in decision support software, continuing a decade of excellence. For hardcopy samples, call or write: Phyllis Shockey, 1-800-531-5038 (in Texas and Canada call 512-346-4980): EXECUCOM Systems Corporation, 3410 Far West Blvd., Austin, TX 78731.

EXECUCOM
A CONTEL COMPANY

[illegible]

This is no way to manage a network.

It takes more than wishful thinking to keep a network up and running. Particularly if you're working with more than one vendor and coordinating resources in many locations. Just by adding users, small problems can turn into big ones and, before you know it, your network's down from here to Hong Kong.

Not to worry. Now, there's the new Codex 4800 Series Network Management System. It monitors your network and detects and helps correct potential problems before they foul up your operation.

There's more. The Codex 4800 Series can generate reports for tracking, analysis, and forecasting...all of which you need for making the right decisions at every organizational level.

The Codex 4800 Series Network Management System is so fast and so smart, you can spot potential problems and react much more quickly to changes in the environment. And, since it's totally independent of your mainframe, you get status information without affecting ongoing operations.

The system works with the industry's most-preferred networking modems from Codex, and includes a raft of other features to make your network more effective. You have greater operational control, improve your cost efficiency, and ensure optimum network uptime.

Whether your network is large or small, Codex has the network management system that will meet your needs and grow right along with your business.

So uncross your fingers and reach for the phone. Call **1-800-426-1212, Ext. 281,** for more information on the new Codex 4800 Series Network Management System. Or write Codex Corporation, Dept. 707-281, 20 Cabot Boulevard, Mansfield, MA 02048.

PROGRAM

from page 45

it in an IBM Vsam file, Haab said. After a program is modified, it captures the results of an application run and compares the two, noting discrepancies. The programmer can then inspect the differences to see whether they reflect anticipated changes or unexpected results, Haab said.

Before it installed Verify, Manufacturers Hanover had to schedule clerks for overtime work to enter and reenter test data. Complete testing took 12 to 13 weeks, a period that has been cut in half with Verify, said Kenneth A. Hamilton, senior vice-president for global systems.

Florence Bell, manager of testing services at Shearson Lehman Brothers, the brokerage house subsidiary of American Express Co., said Verify's test results could be viewed online as screens on a CICS terminal or printed out.

It is this access to test results, along with a more automated testing procedure, that distinguishes Verify from its competitor, a combination of CICS/Common and CICS/Replay from Highlander Systems, Inc., of Orem, Utah, Bell said. She evaluated both, along with an IBM product, Vtam Performance Analysis Reporting System 2 (Pars) with the Teleprocessing Network System (TPNS).

The Replay combination and Vtam Pars-TPNS both required batch processing and reformatting steps before test results could be viewed, Bell said. The IBM product had a manual editing step before reformatting, and data captured by Vtam Pars had to be fed into TPNS for a simulated run as opposed to Verify's use of the actual application to run the test data, according to Bell.

As with Verify, Replay results could be viewed on a CICS terminal after a batch processing run that separated test scripts. Vtam Pars-TPNS results were available at a TSO terminal after a batch process run, she said.

Prices in line with other packages

After evaluating the three, Shearson Lehman bought Verify. Bell said the $25,000 per CPU for a DOS version and $35,000 per CPU for an OS version was in the range of other software development packages.

Equitable Life's Wysocki, however, said his company initially was offered Verify for $6,000 from its developer, Brask Systems, Inc., a four-year old company in Downers-grove, Ill. While Equitable was negotiating with Brask, the company sold Verify, formerly known as TCA, to On-Line Software, and On-Line increased the price to $25,000 before Equitable concluded the deal.

Wysocki and another Verify user, who asked to remain anonymous, said they disputed the price increase. Equitable ended up purchasing the program at close to its listed price.

Joseph Olynick, On-Line's Verify product manager, said his firm was investing in enhancements to the product and was providing technical support for users.

The $6,000 figure represented "a price somebody was charging from his basement," Olynick said.

David Brask, president of Brask Systems, said the program took two man-years to develop. He said he lost sales when he tried to market it at the $6,000 price because potential customers "thought it must be junk."

Maimon is compatible with the Mentor Graphics Idea series of computer-aided engineering workstations. Based on an iterative software algorithm, Maimon is said to achieve 100% convergence on the first run of simulation.

It costs from $13,900 to $22,800, the vendor said.

Mentor Graphics, 8500 S.W. Creekside Place, Beaverton, Ore. 97005.

■ BTI Computer Systems, Inc. has announced that its MCBA business software, the MCBA Generalized Accounting system and the Distribution system, are now available for the BTI 8000 32-bit multiprocessor system.

Modules of the accounting and distribution systems range in price from $6,500 to $7,000 for general ledger, accounts payable, accounts receivable, payroll, inventory management, customer order processing, purchase order and receiving and bill of materials.

BTI, 870 W. Maude Ave., Sunnyvale, Calif. 94086.

■ Pathway Design, Inc. has announced Pcpath/Encryption, a hardware-software product for encrypting data used in the company's Pcpath micro-mainframe link.

The Pcpath/Encryption technology was developed by Jones Futurex, Inc. The product uses Futurex's Encryptor 304 board and Futurex's code on the micro linked to an IBM host, a spokesman said. Pcpath provides links to IBM 370, 4300 and 8100 series and Series 1 processors. The product complies with the national Data Encryption Standard specified by the National Bureau of Standards.

Users encrypt micro files with one keystroke and command. Most of the encryption algorithm is contained in a custom-designed processor.

The price for Pcpath/Encryption, scheduled for September availability, is approximately $900.

Pathway Design, 177 Worcester St., Wellesley, Mass. 02181.

■ DIS/ADLpipe, Inc. has announced that its line of piping design and engineering applications now runs on Sperry Corp. 1100 series mainframe computers.

informatics general corporation.

application development report: MARK V

MARK V® HELPS MINIMIZE NEED FOR IMS-TRAINED PROGRAMMERS

"MARK V is helping us to be responsive to user requirements in a timely fashion, while minimizing the need for a heavy IMS resource," says Mike Berkley, Systems Consultant and MARK IV®/MARK V coordinator at Arizona Public Service Company, a Phoenix-based utility.

A software product of Informatics General Corporation, MARK V is an online application generator that can increase programmer productivity by 30 to 80 percent. The development tool allows the programmer to specify what functions the program is to perform, with minimal knowledge of IMS data base processing or online interfacing requirements.

Arizona Public Service has been using MARK IV, a batch oriented application generator for some time, so the company had built up a considerable MARK IV programming expertise by the time MARK V was brought in. This MARK IV talent has been a great asset in training MARK V programmers for the new online applications the company is developing, Berkley notes.

"In the MARK V applications we've developed so far, we've found that the bulk of the system can be done by someone with little or no experience with IMS, a data-base management system from IBM — especially if the programmer is familiar with MARK IV and its hierarchical structure, for example," he explains. "I believe the programmer needs to have some feel for the IMS environment, but at a much more simplified level than what you need to write IMS COBOL."

However, Berkley cautions, it is still necessary to have an IMS-trained coordinator or data base administrator involved in the application development to assure that IMS efficiencies are maintained.

The first test for MARK V was a tie-in with the existing customer information system to allow charitable contributions with utility payments. It had to be done in one week and was! Next, an accounts receivable package was enhanced. Applications were developed in Data Administration to improve access to the table control system and the IBM Data Dictionary. The payroll/personnel function was the scene for several timely, yet very user friendly systems, including medical monitoring and hazard control. One user was so pleased that they changed direction away from a mini and are now committed to the mainframe, an IBM 3081. Payroll/Personnel Systems Supervisor, Bernie Baker, claims "I now have a tool which allows in-house development to compete with software packages." Baker goes on to add, "I'm extremely pleased and encouraged by the success in using MARK V and plan its use in many future applications."

This set the stage for the most important use of MARK V so far — an enhancement to an existing COBOL Gas Services Request System to provide dispatchers and management with more extensive and time information in "trouble" orders. The system was needed as soon as possible, but heavy IMS experience was not available, while MARK IV experience was. Hank Oen, Supervisor, Gas Systems says, "I was convinced that we could not meet the schedule deadlines with a procedural language."

The first step was a one week MARK V class that Berkley taught to Oen's group. Rather than doing the standard class problem, the students programmed two screens from the actual gas

"I believe the programmer needs to have some feel for the IMS environment, but a much more simplified level than what you need to write IMS COBOL."

system. One team had a working subsystem by the end of the second day. Because of the specific need, the class featured an extremely high intensity level and many questions. Once the class ended, the heavy development began and the system was installed on time. However, it became clear that the response time was unacceptable, primarily due to browsing through the secondary index and excessive processing. A redesign effort was undertaken, using MARK IV for a data base conversion and making more efficient use of MARK V. In the meantime, the vital part of the system was left in production by removing certain MARK V requests. It was in this two week redesign effort that MARK V excelled, says Oen, "Module interchangeability allowed reconfiguration of functions for performance improvement in weeks vs months." The final result left smiles on the faces of Corporate and Computer services management, the user and technical staff.

"So far, we've had success using MARK V for smaller applications, especially those with severe time constraints, but I think many of the enhancements have made it a viable product for large-scale systems," Berkley adds. "I particularly like features such as the dynamic action codes, multiple data base updates, data base browsing, subroutine capabilities and, of course, the Program Function keys."

I would like to see how the MARK Series can help me with my CICS, IMS/DC and batch programming.

SNA

from page 45

programs anywhere within a network. Is that accurate?

No. You can execute programs anywhere in the network because you can request a conversation with the program. You have location insensitivity in the sense that when you ask for a conversation with a certain program you simply specify the name of the program and the logical unit that it is on. You don't have to know where in the network it is. But you don't have a directory of where files are, for example. You can build that on top of LU6.2, and that is something we are looking at. But that is not something provided by LU6.2 today.

Two software packages supporting LU6.2 are said to be able to communicate as peers regardless of their host processors. How would you classify that communication?

There are two types of LU6.2 implementations. There is what we call the open Application Program Interface [API] and the closed API. The closed API is where you get LU6.2 along with some application. Take our Scanmaster, which is a [facsimile] machine. The customer cannot get in there and write his own programs. So what you are getting in that case is the Document Interchange Architecture application. On the other hand, if you buy [an IBM] CICS system, you get LU6.2 on top of it. You can add any type of application you want to write. What you get is what you buy. If you buy a closed API system, you get the prepackaged application. If you buy an open API product, you can add whatever applications you buy or develop.

Does LU6.2 spell the end for micro-mainframe link products that are based on simple terminal emulation?

I don't see that there is ever an end for anything in this world. People have bought these products, and they're going to continue to use them. To put LU6.2 in a positive way, technology has just introduced another option to the customer. Revolutions are more effective when they are evolutionary.

Considering the importance of LU6.2, why has it taken IBM so long to provide support for it in Personal Computer products?

I don't have a good answer. That question comes up all the time. The only possible answer is that IBM has a limited amount of resources, and there has to be some prioritization.

Is IBM encouraging third-party software vendors to implement LU6.2 in their products?

We have published all the protocols. There is a great big fat book out there with every detail you need to know to implement it.

I think that is a tremendous amount of encouragement. There is no specific support in terms of educational classes or hand-holding or anything.

Is there a master plan as to which IBM products will support it?

It is more of an individual product-by-product decision that is subject, of course, to corporate review.

Is it a subject of great interest to IBM now?

Yes. It has been for some period. I think the terminology would be recognized by all of our executives, and its status in different product plans is a very hot topic.

Is LU6.2 a major step toward distributed processing?

Sure. It allows distributed programs to talk to each other without having to know where the other program is, without having to know the details of the underlying protocols. It is very natural and easy to develop distributed applications using LU6.2. That is its whole goal in life, to make the development of distributed applications as easy as possible.

What would you tell people to look for in the future with LU6.2? What are the things that are going to happen now that this is becoming implemented and supported?

We are past the architecture phase, though we are still working on some enhancements. I think we are also past the initial implementation phase. We have implemented it in a lot of products, and there will be more to come.

I think we are at the stage where LU6.2 is poised to be widely introduced into the world, widely purchased and installed. I think the next phase is going to be the writing of a lot of interesting applications that use LU6.2.

Continued from page 59

the Sperry mainframes include the Design Information System for maintaining a design data base, ADLpipe for modeling structural analysis of piping systems, Flownet for hydraulic analysis and Adinap for nonlinear analysis of piping materials. The products are priced from $25,000 to $42,000.

DIS/ADLpipe, 55 Wheeler St., Cambridge, Mass. 02138.

■ Uccel Corp has announced Release 3.2 of its Tax Planning and Compliance Manager, a mainframe software package that automates federal, state and local tax planning and compliance.

Release 3.2 of Tax Planning and Compliance Manager runs in IBM's IMS DB/DC environments. The product is supported on IBM's 370, 3030, 3080 and 4300 series machines.

The Tax Planning and Compliance Manager is priced from $49,500.

Uccel, Uccel Tower, Exchange Park, Dallas, Texas 75235.

SUDDENLY, YOU'VE EXPANDED YOUR SERVICE NETWORK BY 2,700 PEOPLE.

How? By utilizing Diebold® Quality Care™ as a third-party supplier for your local, regional or nationwide service needs.

Diebold maintains approximately 400 service locations in every state and Puerto Rico, staffed by over 2,700 highly trained personnel supported with a multilevel inventory stocking program and highly skilled technical support organization.

Now you can offer your customers the same high-quality, responsive service that's made Diebold a leader in the service of electronic and electromechanical systems for the nation's financial and retail markets.

Diebold Quality Care is your entry into service excellence surrounded by a tradition of solid commitment to responsive, professional, dedicated service.

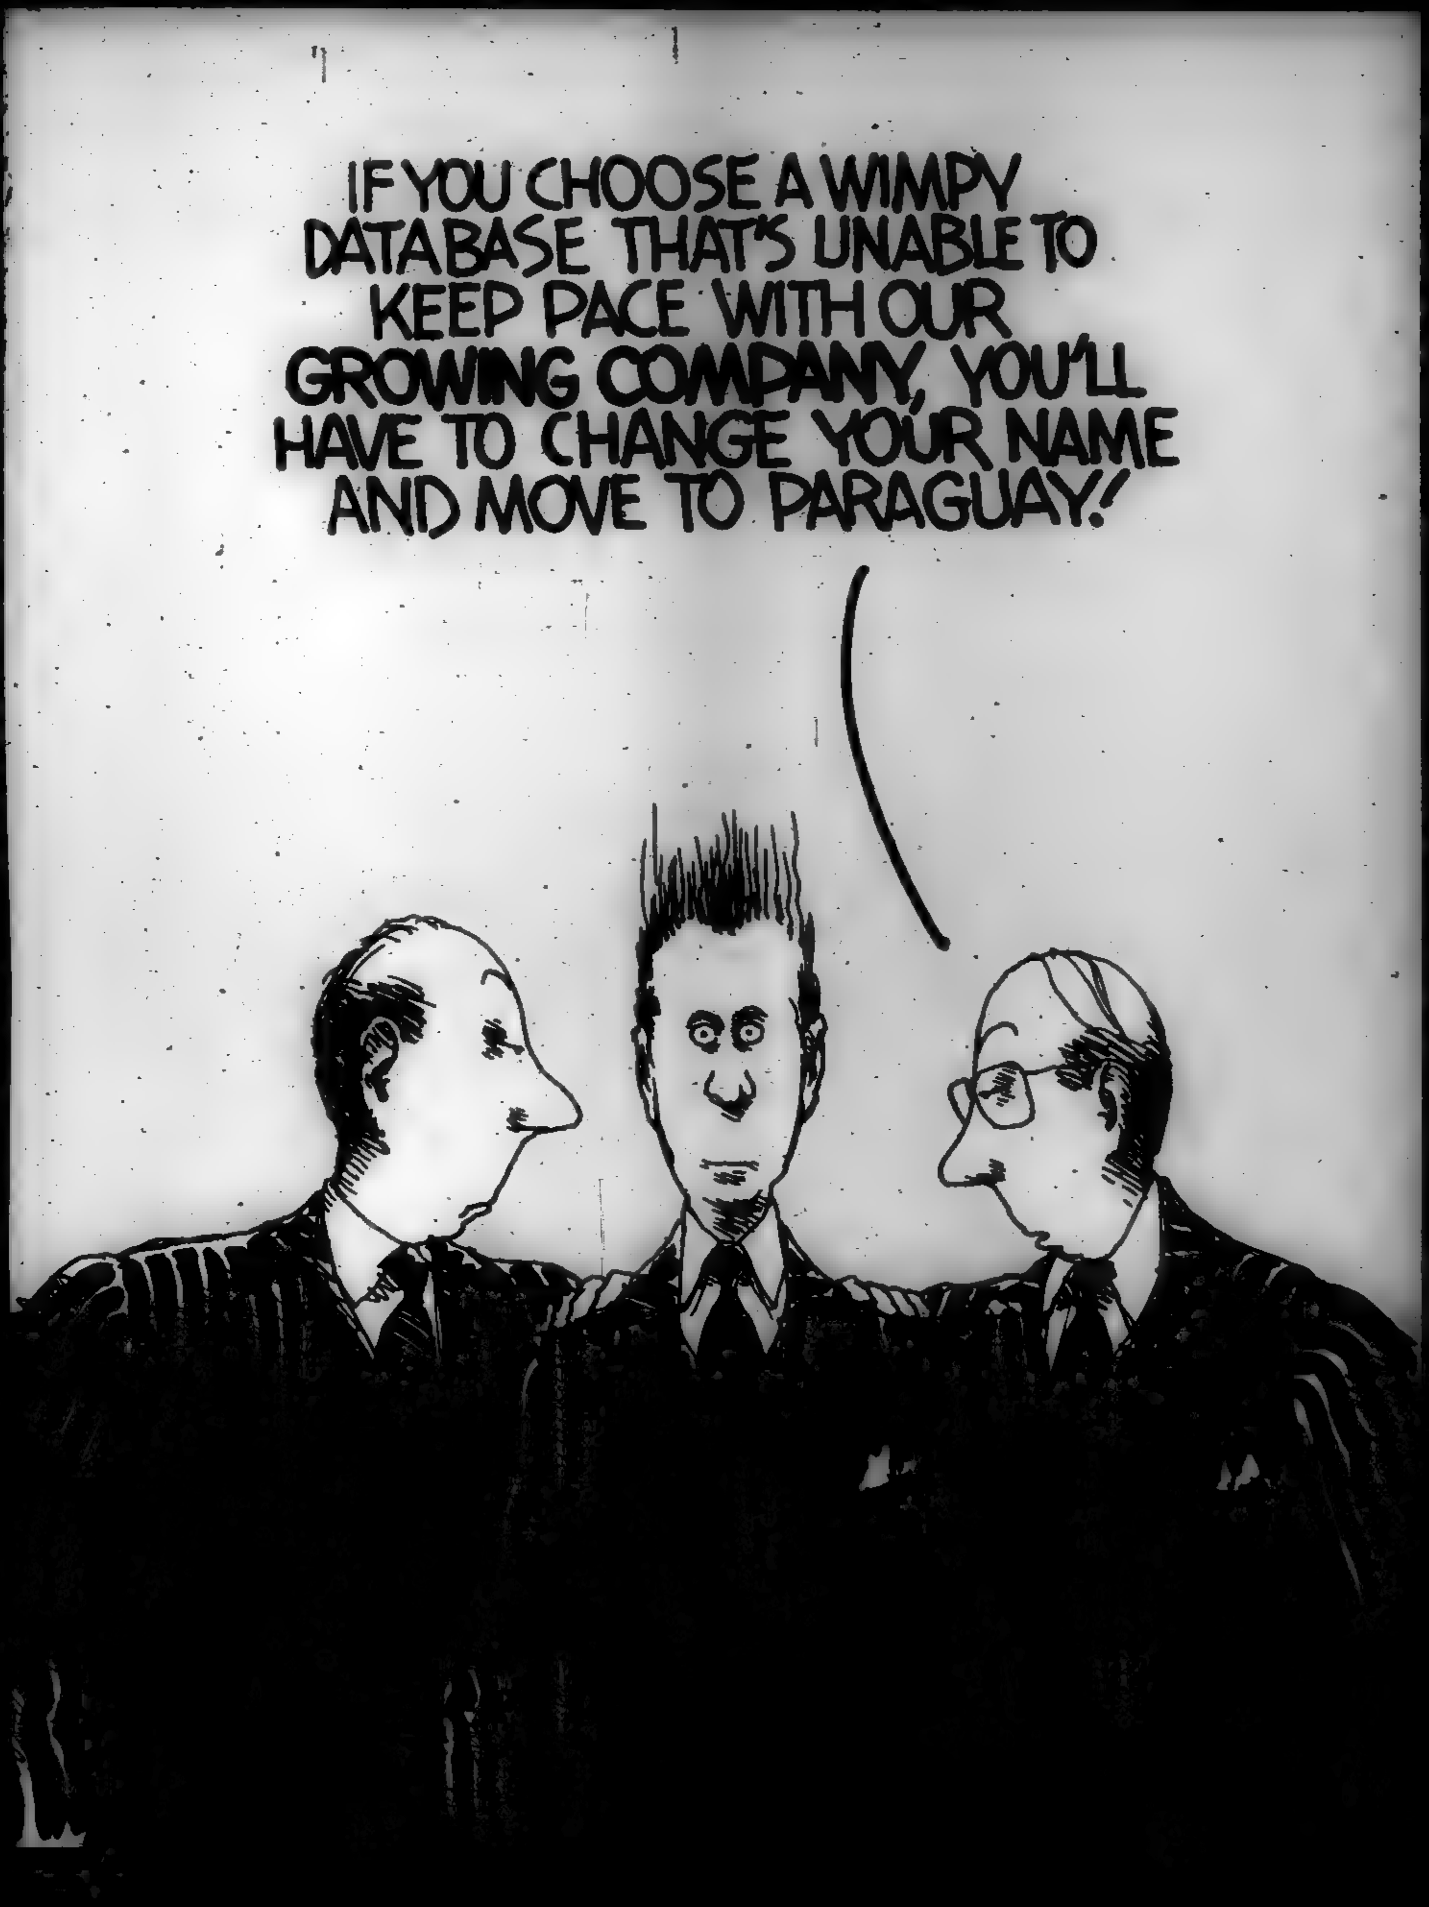
And it's an opportunity to help you sell more by expanding your products' service offerings—instantly.

If the idea of one-source service appeals to your sense of efficiency, you owe it to yourself to learn more about Quality Care—at no obligation. Write our Director of Marketing, Customer Services Group, DIEBOLD, INCORPORATED, P.O. Box 8230, Canton, OH 44711. **Or, for faster response, call 216-489-4110.**

QUALITY CARE

Putting you in touch with the future.

DIEBOLD®



IF YOU CHOOSE A WIMPY DATABASE THAT'S UNABLE TO KEEP PACE WITH OUR GROWING COMPANY, YOU'LL HAVE TO CHANGE YOUR NAME AND MOVE TO PARAGUAY!

"Revelation® is a classic case of 'you get what you pay for.' It costs a bit more than most, but it gives you the best there is."

PC Magazine
September 4, 1984

If you think that dBase III™ or R:base 5000™ is the solution to your information processing needs, consider for a moment the high expectations you and your company should have for your next database management system.

For starters, it needs to network.

Your PC's may not be talking to one another today. But they will soon. With Network Revelation you decide when and how. That's because our network software is available now, not "someday soon." And it works with a variety of microcomputer networks.

You choose the best technology for your unique needs. Including hardware by IBM,® Novell and Nestar. And PC-DOS 3.1 or Novell NetWare™ operating systems.

Make sure the DBMS locks records. If it doesn't, your data is in danger.

Network Revelation locks data at the record level instead of restricting access to entire files. If this seems like a trivial feat, you'll be surprised to know that Revelation is one of the few network database systems that work this way.

With most others, record management is a free-for-all. One person opens a file and locks everyone else out. Or multiple users can simultaneously change data. Hardly the makings of a DBMS for critical record keeping.

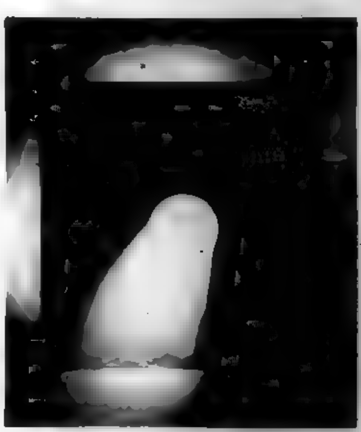
If the database can talk to mainframes and minis, you've just written your ticket to a complete distributed processing system.

Revelation isn't about to be confined by the limits of MS-DOS.™ For advanced programmers, we include tools to access the world of mainframes and minis.

Imagine, the knowledge of a mainframe in everyone's PC. With Revelation you have an interactive distributed information system that shares both data and processing power. With complete password security, of course.

Be sure that the application generator has an excellent command of the language.

R/Design, Revelation's application development system, does more than paint screens and define relations. It's so powerful your programmers can bid farewell to COBOL forever. And save weeks of coding time on new projects.



That's because R/Design writes programs in R/Basic source code for you. And R/Basic is the most powerful relational database language running on PC's.

Find out how easy it is to retrieve information. Ask the DBMS a few pointed questions.

If you're thinking that Revelation's capabilities make it too sophisticated for the computer neophytes in your company, fortunately, you're wrong.

R/List, Revelation's query language, uses common English words. And unlike other so-called "natural language" programs, you can do far more than define synonyms for system commands and file names.

Words you create can actually call R/Basic programs. A simple inquiry will perform complex calculations, build symbolic fields and write detailed reports.

To be successful, you need the best database there is.

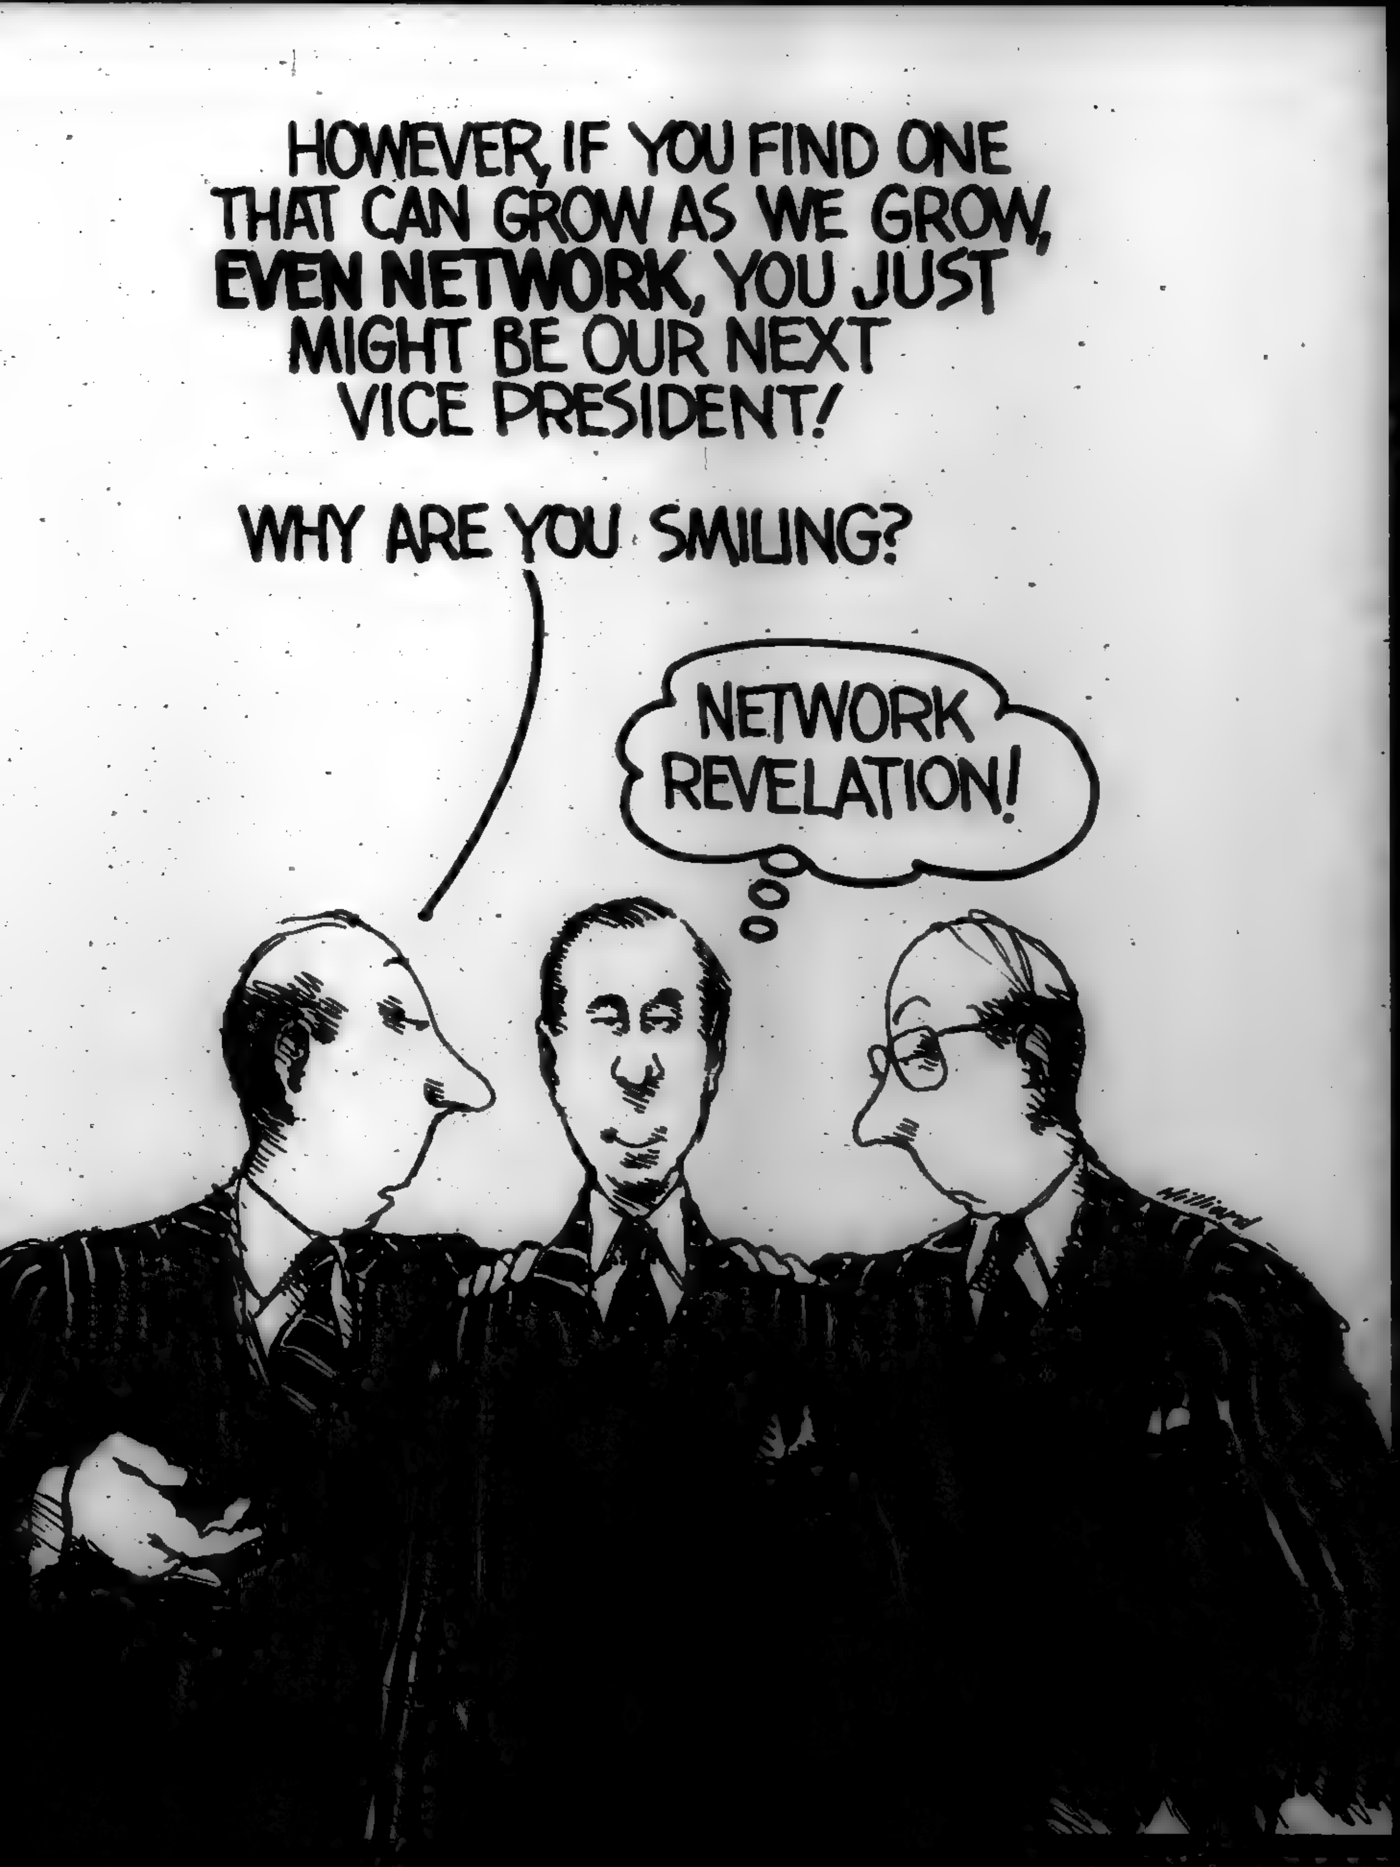
That means superior technology with its roots in mainframes and minis. A system so powerful it delivers on every challenge you throw at it.

Network Revelation has it all: variable length fields to conserve precious disk space; unlimited files, fields and records; data dictionaries; dBase II® and Lotus 1-2-3™ conversion utilities; a high-speed compiler; an interactive program debugger; and prices that begin at just $1495 for a complete four user system (suggested U.S. list price).

You won't be the first to buy Network Revelation.

Alert companies like Ford Aerospace, First Interstate Mortgage, Rolls Royce, Price-Waterhouse and Rockwell have already discovered why *PC Magazine* called Revelation "the most comprehensive and powerful database management system available today."

You'll see the difference too when you turn the page...



HOWEVER, IF YOU FIND ONE THAT CAN GROW AS WE GROW, EVEN NETWORK, YOU JUST MIGHT BE OUR NEXT VICE PRESIDENT!
WHY ARE YOU SMILING?
NETWORK REVELATION!
Hilliard

A revealing point by point comparison between Revelation, R: base 5000 and dBase III

	Network Revelation	R:base 5000	dBase III
Maximum Characters per Record	65000	1530	4000

Motivating Maintenance Personnel

By J. Daniel Couger

■ ■ ■

"Maintenance . . . tends to act as a millstone around the neck of the development organization."
— Philip Howard

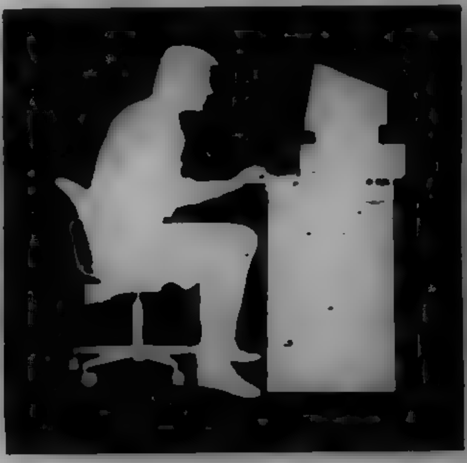
"Traditionally, program maintenance has been viewed as a second-class activity, with an admixture of on-the-job training for beginners and of low-status assignments for outcasts and the fallen."
— Richard E. Gunderman

The above quotations are typical of the attitudes concerning maintenance. They take on added importance when one recognizes that maintenance constitutes more than half of the work of the typical information systems department. Worse yet, that percentage is growing and is forecast to be more than 60% by 1990.

Our research over the past seven years has shown that maintenance work has only one-half to two-thirds the motivating potential of other programming/analysis work (Figure 1). That fact was revealed through analysis of our national data base of more than 8,000 computer personnel.

The job's motivating potential falls precipitously as the amount of maintenance increases. As shown by the curve on the left in Figure 1, fix-it activities are especially demotivating. However, the curve on the right shows every category of maintenance as demotivating. This chart illustrates the huge potential for improvement.

Despite the prevailing view of maintenance, some progressive organizations have proved that such work can be enhanced. Maintenance productivity is as high as that in newly developed organizations. The approach taken in these organizations is analyzed in



PHOTO/ILLUSTRATIONS BY O'CONNELL/ASCOLESE

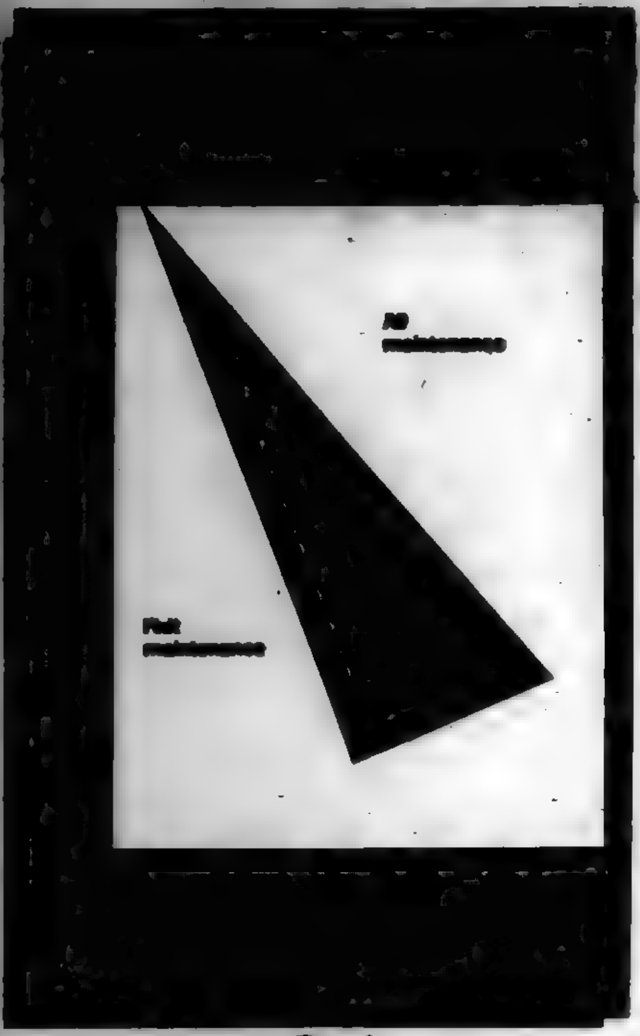


Figure 1

depth in the new Couger-Colter book, *Maintenance Programming: Improved Productivity Through Motivation*, released recently by Prentice-Hall, Inc.

It took a year to identify 10 organizations with good maintenance productivity. In phase one of the research, more than 500 persons in the 10 organizations completed the Couger-Zawacki diagnostic survey questionnaire for computer personnel. In phase two, on-site interviews were conducted with 104 persons — 61 analysts and programmers and 43 supervisors/managers of systems departments. The results demonstrate that productivity can improve by using motivation enhancement procedures — with at least 10% and as much as 40% improvement in productivity.

We synthesized the approaches used in the 10 organizations into a set of generic procedures and selected 13 applications cases to demonstrate improved motivation for maintenance personnel. One or more of these cases will apply to every organization, be it governmental or industrial.

Cost of maintenance

In a study by Barry W. Boehm comparing data on maintenance cost with other hardware/software costs, the proportion of the hardware/software costs allocated to system maintenance in the typical U.S. computer installation is not only more than half of the total software cost but is also approximately 50% of the total computing cost (Figure 2).

A recent study by the General Accounting Office (GAO) estimates that the federal government spends at least $1.3 billion annually on software maintenance, excluding weapons systems software. A recent U.S. Department of Defense study shows that the cost of development for U.S. Air Force avionics software averages $75 per instruction, while the cost of maintenance corrections of deployed software ranges up to $4,000 per instruction.

For some organizations, the cost of maintenance is even higher (Figure 3). J. L. Elshoff indicates that the figure for GM, which is fairly typical of large business software activities, is about 75%. E. B. Daly notes that about 60% of GTE's 10-year life-cycle costs for real-time software are devoted to maintenance. On the two Air Force command and control software systems shown, the maintenance cost was 67% and 72%, respectively.

The Boehm study reports the annual cost of software in the U.S. in 1980 was approximately $40 billion, or about 2% of the gross national product. The number of applications installed has increased substantially, increasing the maintenance load.

In addition, the average system life increased from three years in 1960 to five in 1970 and eight in 1980. The GAO study estimates the current cumulative federal investment in software at $25 billion.

Maintenance is labor-intensive. John Diebold projects that in 1985, the cost of hardware will be one-tenth of the 1979 cost and that labor costs will be twice as high as the cost in 1979 rate. These figures confirm the significance of the maintenance activity throughout the U.S. in both government and private industry.

Productivity problem

As a result of his study of maintenance productivity, Chester Lin observes, "Analysts and programmers generally view the maintenance function as an inferior, noncreative, nonchallenging activity."

As this quote illustrates, maintenance is a problem

The #1 3270 alternative for people who want flexibility.

CHOICE

The need for a 3270 alternative shouldn't replace the need for keeping your terminal system flexible, your options open. That's why the #1 choice is Telex.

Look to Telex, and there's a lot to look at. In fact, next to IBM nobody sells more 3270 displays, printers, controllers and intelligent workstations than Telex. And for maximum flexibility Telex's wide range of terminals plug directly into Telex or IBM controllers. There's a choice of high-speed matrix or letter quality output devices and easy-to-use, low-cost display printers, too.

But product selection isn't the only choice. Telex displays offer features like color graphics, monochrome or color monitors, and ergonomic tilt/swivel design. There's a selection of keyboards, too. Plus extended highlighting and light pen capability. Telex also offers controllers that support local print buffering, format storage and dual host communications.

There's a choice of service plans, too. Backed by over 2,000 Telex-dedicated service and support people worldwide.

No wonder more and more companies are making Telex their 3270 alternative . . . It's the #1 choice.

For more information, contact John Hawkins, 6422 E. 41st Street, Tulsa, OK 74135/1-800-331-2623.

The #1
3270 Alternative

TELEX COMPUTER PRODUCTS, INC.

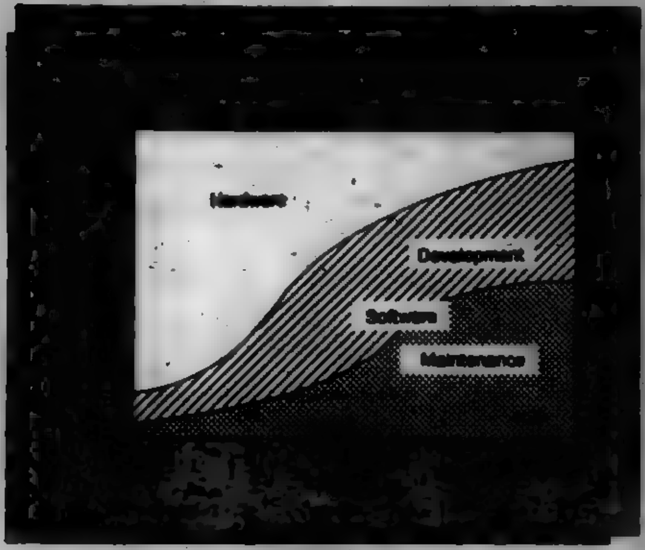

Figure 2

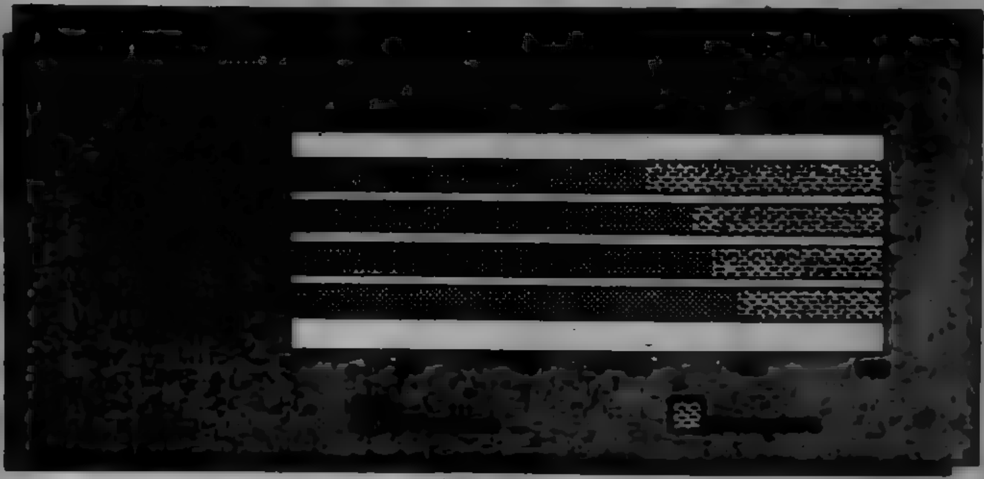

Figure 3

area for management not only because of the high cost but also because of the way the work is perceived by computer professionals.

Gerald Weinberg tells a story about a programmer who frequently changes firms — always after his new development project is installed and he is assigned to maintain it. Weinberg observes that, though apocryphal, the story is representative of what is happening in the industry.

The high cost of turnover

Although the U.S. economic decline has reduced turnover rates, turnover in the computer field is still high compared with other professions, and it is costly.

The cost of replacing maintenance personnel includes the cost of hiring and training. Here, the learning curve for incoming personnel is significant for the following reasons:

- Documentation tends to be poorer on older systems.
- The systems are less structured.
- They are written in assembly language or early versions of a high-level language.
- Few people who originally worked on the system are available in case questions arise.

However, turnover costs that result from loss of personnel dissatisfied by maintenance assignments are negligible compared with the cost of maintaining these systems by using dissatisfied people.

If the industry view of maintenance work as characterized by the comments of Lin and Weinberg is valid, more than half of the analysis/programming work in a computer department is being performed by people who consider the work unchallenging — even boring. The resulting loss in productivity amounts to millions of dollars per year.

Misguided approaches

Some organizations have attempted to lessen the negative attitude about maintenance by renaming the activity. One organization insists that all employees refer to maintenance as "retrofit activity." Several other organizations call the activity "enhancement."

Such a change is merely a superficial approach to correcting the problem. Just as the janitorial field has learned, if you change the name of a dull and boring job, you do not change the job content — it remains a dull and boring job. If you are in maintenance, a new title may help increase status when explaining your job to a person outside the company, but it does not make your work any more motivating.

Although a name change will produce little positive effect, there is promise for improving the situation. Analysis of the Couger-Zawacki survey results for individuals, supplemented by the interview process, reveal some individuals who were not demotivated by maintenance work and who were considered by their supervisors to be quite productive. These individuals believe their maintenance assignments to be challenging and interesting.

Research enables us to identify the job characteristics and personnel characteristics of a productive maintenance environment so that other organizations can emulate these situations.

Growth and motivation

Our prior research [CW, March 10, 1980] shows that people who have a high need for personal growth and development will respond more positively to a job high in motivating potential than will people with low growth need. Obviously, not everyone is able to become internally motivated — even when the motivating potential of the job, measured by a motivating potential score (MPS), is quite high.

Behavioral research shows that the psychological needs of people determine who can, and who cannot, become internally motivated at work. Some people have a strong need for personal accomplishment — for learning and developing beyond where they are now, for being stimulated and challenged and so on. These people are high in growth need strength (GNS).

The key reason for computing GNS is to compare it with the job's potential to fulfill an employee's need for growth. A job low in motivating potential will frustrate a person with high GNS — like trying to fit a square peg in a round hole.

GNS is quite high for computer professionals; compared with other professionals and other job categories, it is the highest of 500 occupations that have been measured.

Computing a job's MPS enables a comparison of employee GNS and the job's potential to motivate that person. MPS reflects a job's potential for eliciting positive internal work motivation on the part of employees. Our previous motivation research shows the degree of "richness of a job" (the MPS level) needs to be matched with the individual's need for a rich job. Not all individuals are seeking enrichment in their jobs.

The most important characteristic in the MPS/employee matchup is GNS. High GNS people are seeking

MOTOROLA

> 77
>
> *The ideal situation would be a DP department that had 50% of its personnel with low GNS and the other 50% with high GNS. . . . Unfortunately, that ideal situation exists in few organizations.*

high MPS jobs. Assignment of a low GNS person to a high MPS job cannot be expected to result in satisfactory productivity. Conversely, a high-GNS individual will be unchallenged and unproductive in a low MPS job. Figure 4 shows the four-cell matrix that characterizes those MPS/GNS matchups and mismatches.

■ *Cell 1 — High-Scope Task + High GNS = High-Level Congruence*

Individuals in Cell 1 have high GNS. They desire tasks that are challenging — complex, nonstructured tasks that they perceive as significant. They want a high-scope task for which they feel responsible and are aware of expected performance. If we have a match in scope of task and GNS, we have a high level or congruence between task and individual need. Examples of high-scope tasks include new applications development, data base design or telecommunications design.

■ *Cell 2 — High-Scope Task + Low GNS = Low-Level Congruence*

Cell 2 reflects the situation where an employee with low GNS is assigned a high-scope task. The level of congruence is low, and a poor motivational environment results.

An example of this is the promotion of a person from operations, where GNS is lower, into the systems development area. One would not expect good productivity in this situation unless changes are introduced to correct the disparity between task and individual need.

■ *Cell 3 — Low-Scope Task + High GNS = Low-Level Congruence*

In the situation depicted in Cell 3, an employee with high GNS is assigned a low-scope task. The level of congruence in low, and the employee is likely to be frustrated and dissatisfied. There is no assurance that the level of productivity will be high. One example is a routine maintenance task assigned to a high GNS person.

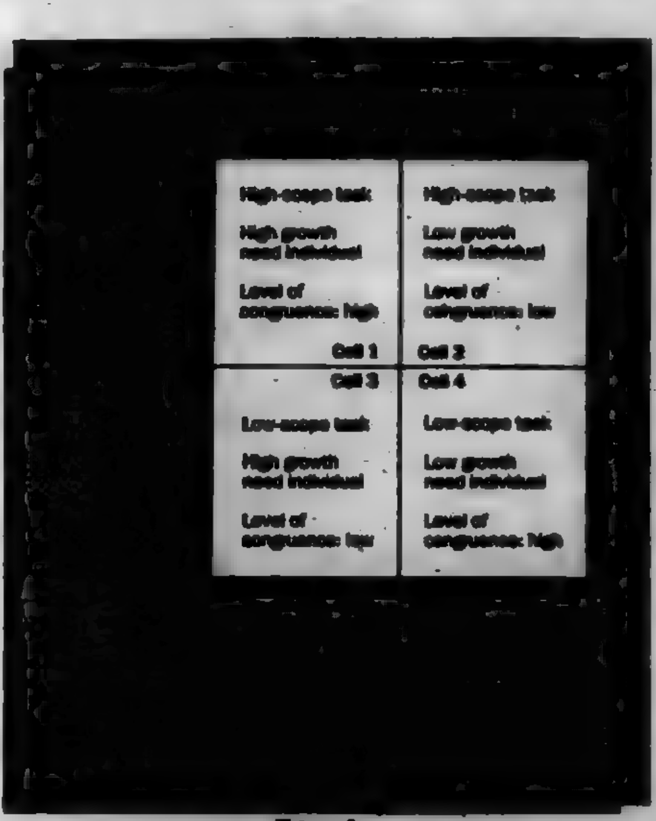
■ *Cell 4 — Low-Scope Task + Low GNS = High-Level Congruence*

The fourth cell reflects the situation where lower GNS employees (like the former computer operator described above) are assigned less demanding tasks such as routine program maintenance. A high level of congruence exists between task and individual need. The motivational environment is good, and a concommitant high level of productivity can be expected.

The ideal situation

With maintenance constituting approximately 50% of the work load, the ideal situation would be a DP department that had 50% of its personnel with low GNS and the other 50% with high GNS. New systems development could be assigned to the high GNS personnel and maintenance to the others. The Cell 1/Cell 4 situation would exist — high congruence and high productivity could be expected. Unfortunately, that ideal situation exists in few organizations. Managers must intervene to produce a better MPS/GNS mix.

The key point to recognize concerning MPS is that it is comprised of five variables, or job dimensions: skill variety, task identity, task significance, autonomy and feedback from the job. The survey results indicate that the job dimension of skill variety is a key cause of employees perceiving maintenance work as less challenging.



High-scope task High growth need individual Level of congruence: high Cell 1	High-scope task Low growth need individual Level of congruence: low Cell 2
Cell 3 Low-scope task High growth need individual Level of congruence: low	Cell 4 Low-scope task Low growth need individual Level of congruence: high

Figure 4

However, to lower MPS to the nonchallenging level, more than one of the core job dimensions must be low. For example, the autonomy variable may be rated low by individuals — not necessarily because their bosses do not give them freedom to operate but because procedures or policies provide little flexibility.

An illustration of this is the constraint caused by procedures under which the original system was designed and programmed, such as being unable to use structured techniques to maintain a system because the original system was nonstructured and having to write changes in an obsolete assembly language because the programs were originally coded in that language.

Even though supervisors may be unable to redesign the job to enhance all five dimensions, they can work on enhancing two or three to compensate for the low value of the other job dimensions.

Stated another way, if skill variety and autonomy are low, perhaps task identity and significance can be enhanced to raise MPS enough to produce the proper GNS/MPS matchup.

Even the skill variety dimension can be enhanced for maintenance employees. That dimension has two elements — a variety of activities and use of a variety of skills and talents in carrying out the tasks.

When one component of skill variety is constrained — such as confinement to a batch application when the person has the skill to work on on-line systems — the other component can be emphasized.

For example, two people can be assigned to maintain two systems jointly instead of each being required to specialize on one system. In this way, skill variety is enhanced for both employees.

In summary, the research proves that maintenance jobs can be enhanced to the point that motivation levels are comparable to those in new systems development. Such a condition already existed in some of the firms selected for the research, and we were able to document the differences in those jobs. In addition, we have been involved in other job enhancement projects that raise the motivation level of maintenance to that of new development.

The firms selected for the research project have been quite creative in devising approaches to enhance the motivation of maintenance personnel. Some enhancement activities were peculiar to that company's unique situation and are not capable of generalization.

On the other hand, many enhancement activities are portable in the same sense that software can be generalized. Those examples are recorded using a standard reporting format:

- Identification of the specific motivational issue or issues.
- Explanation of the resolution process.
- Evaluation of the results.

The generalized solutions can be applied in most companies with an expectation of similar positive results. As the result, there is a high potential for improved productivity — for individual organizations and for the industry as a whole.

Data switching: Equinox makes it simple.

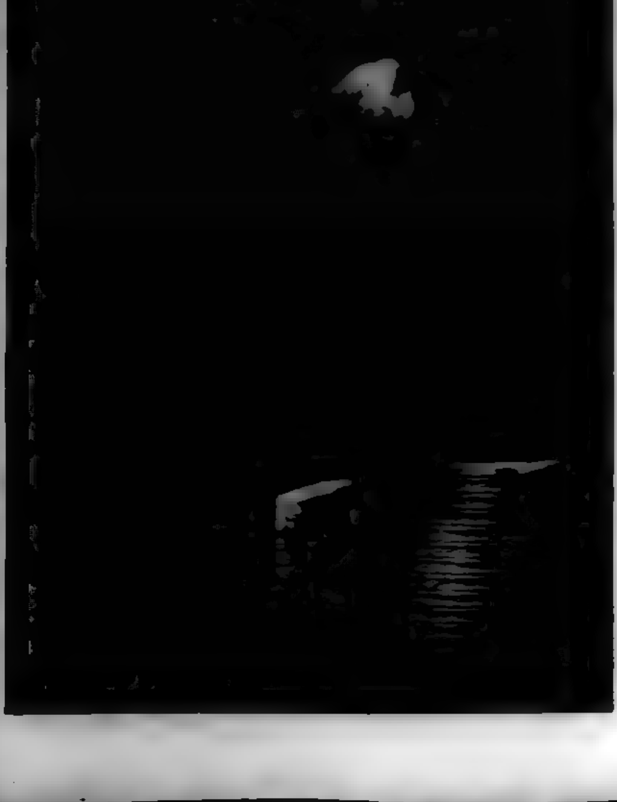
Introducing the Equinox Data PBX; a port selector that makes switching terminals between computers as simple as dialing a phone number.

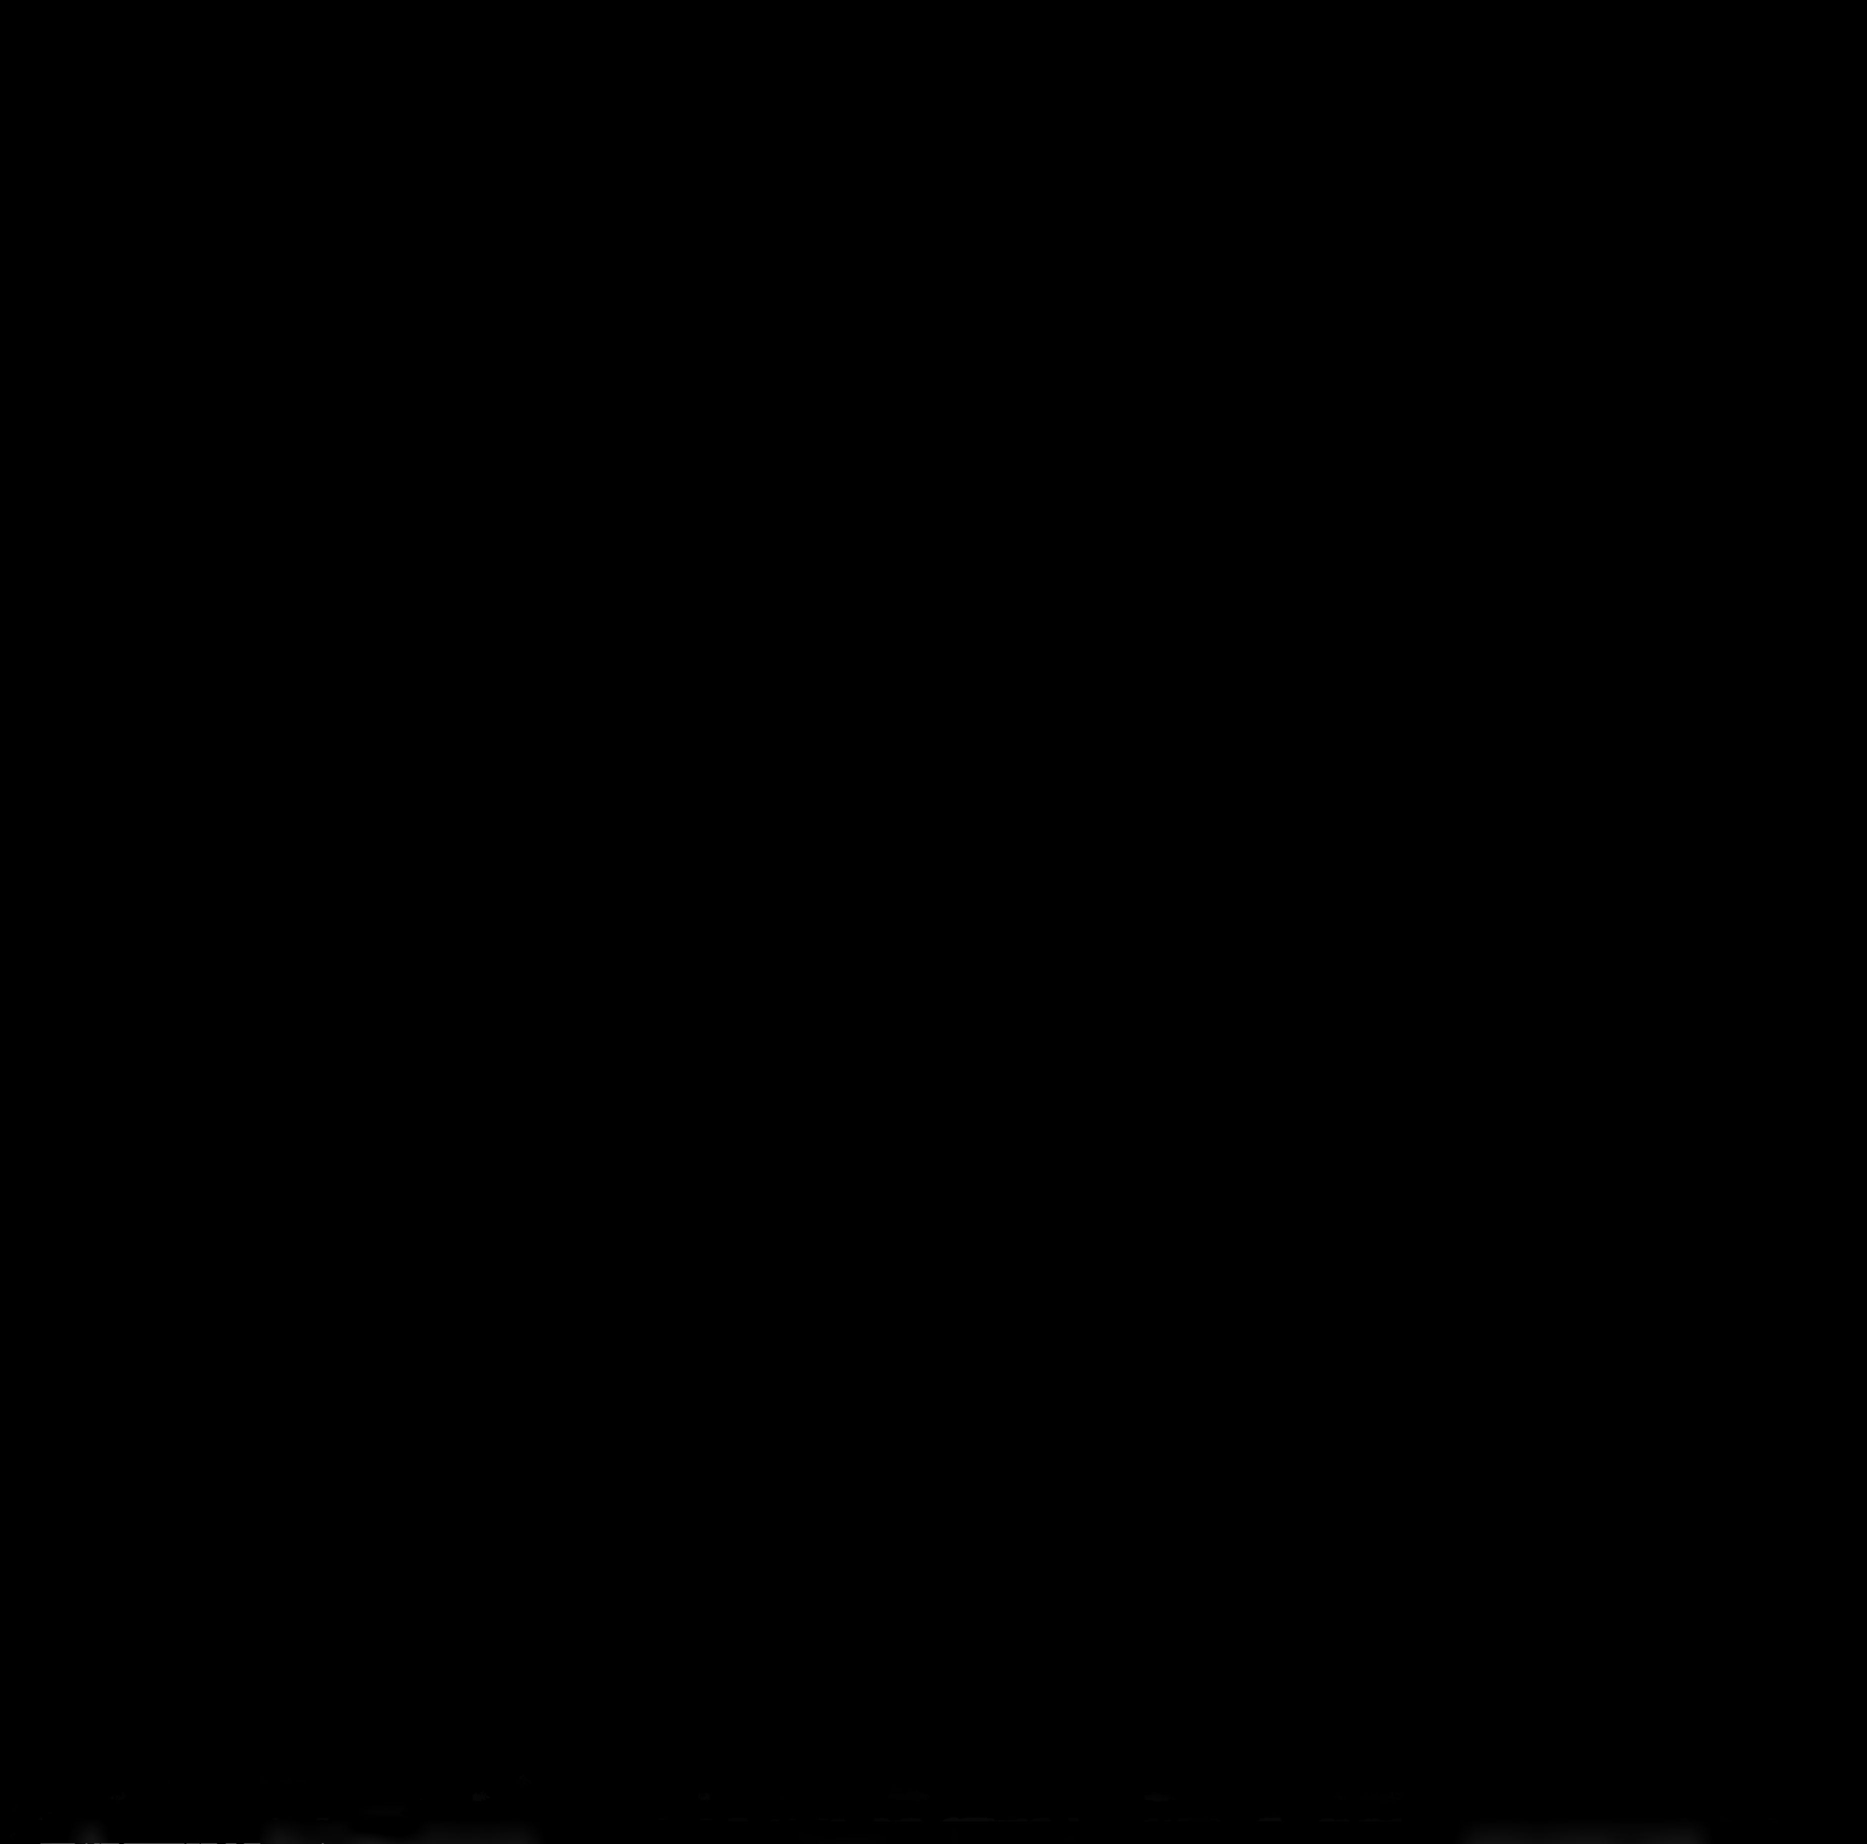
Installation is simple; do-it-yourself using regular telephone PBX-type cabling and connectors.

And it's simple to integrate into your system, thanks to our super friendly, self-explanatory configuration menus.

The system grows to meet your needs, from 24 to 1320 lines. And the state-of-the-art design combines performance and reliability in a compact package that won't break your budget.

Check out the most full-featured Data PBX on the market today; call 1-800-DATA-PBX, for an on-site demonstration.





Unfortunately, information managers don't have such job security.

Even though they make decisions just as tough. Decisions where millions of dollars and thousands of man hours are at stake.

These days, the most difficult decisions involve personal computer installations and configurations. Hardware and software products appear on the market daily. Others disappear at a similar frequency. Making it imperative to purchase systems that while state of the art, can put you in a state of security.

That's why it makes sense to go with DunsPlus. DunsPlus offers a customized standard. A personal computer system that gives you the stability of IBM with the innovation of Lotus and other leading software companies. All in a consistent, menu-driven operating environment that received Software Digest Ratings Newsletter's top rating for integrated programs that run on IBM PCs.

DunsPlus offers you the choice of any IBM PC already configured with proven software programs such as 1-2-3 and MultiMate or DisplayWrite word processing. Plus additional software tools for data integration, file management, micro/mainframe communications, and systems development. Assuring that your PC investments never lose their value.

DunsPlus. Like NOMAD2, the premier 4GL/DBMS, it's one in a continual evolution of computer software services from Dun & Bradstreet.

To assure that your PC judgements are supreme, write DunsPlus, 187 Danbury Road, Wilton, CT 06897, or call 800-DNB-PLUS.

DunsPlus

We make PC products work the way they should. Together.

Maintenance motivation profile: Problems and solutions

Even though supervisors may be unable to redesign a job to enhance all five core job dimensions, they can work on enhancing two or three of the dimensions to compensate for the low value of the others.

In one of the companies we investigated, maintenance productivity was low in the opinion of both the DP manager and the user.

■ **Job description.** The job — maintenance of the inventory system — involved a team of three persons. Change requests were initiated by both the user and the DP manager. User change requests involved the effectiveness of the system, such as revised output formats and incorporation of additional features. DP change requests involved the efficiency of the system — speeding up throughput and sharing data with other applications such as cost accounting and purchasing. Both types of changes were negotiated by the supervisor of the maintenance group. An average of 20 lines of code was required to accomplish the typical change.

The system originally had been implemented five years earlier, and the documentation, not unlike most DP applications, was weak. The code was unstructured; modules were quite large, each involving several hundred instructions.

The system had been patched hundreds of times by more than a dozen programmers, who had progressed through this assignment to more senior positions. One of three programmers presently assigned had worked on the system for 2¼ years; the others for 13 months and five months, respectively. However, the latter two each had more than three years' experience in programming.

Change requests were first analysed by the first programmer, who then suggested an approach to facilitate the modification. He also performed a quality review of the complete code and test results before they were passed on to the supervisor for approval.

Although input was on-line, processing was batch mode. The system was non-data base-oriented but shared data with many other files. More than 30 people used reports from the system daily, and another 15 or so inputted transactions. The view of the programmers as nonproductive was based on their inability to meet a schedule for completing change requests and to reduce the large backlog.

The maintenance programmers griped about not being sent to the training course on the new computer, where the inventory system was being developed and would be processed once completed. They mentioned not being trained in Cobol-74, the language of the new system.

They also cited environmental factors, including the noise level in their area, the lack of individual work space and the deteriorating condition of their furniture.

Finally, in response to performance reviews, the programmers maintained that schedules for change requests were often unrealistic — that management did not take into account the difficulty of modifying a poorly documented, heavily patched, unstructured system.

They said test run turnaround time was poor because they were using the production computer instead of the computer devoted largely to development. Personnel working on a new inventory system, which would replace this one, were using the latter computer.

■ **Motivation analysis.** The manager of this activity also managed 30 other people involved in maintenance. He had attended a Couger-Colter seminar on motivation of maintenance personnel and wanted to apply his new knowledge.

He chose as a test the problematic inventory maintenance job. He tutored the supervisor of that activity on motivation and asked her to read key portions of his notes from the seminar. He had already determined, through discreet discussions with the supervisor's employees, that her supervisory capability was not part of the problem.

The two began a motivation analysis of the job. The supervisor was a "quick take," as are most high growth need strength (GNS) personnel, and quickly separated the hygenic factors from the core motivating potential score (MPS) factors.

■ **MPS/GNS comparison.** The two discussed the GNS of the inventory group. "When I compare characteristics of these three people to others in the unit, I see them as average in growth need," the supervisor said.

"It looks like we have a mismatch in the individual's need for growth (GNS) and the job's ability to provide that growth (MPS)," the manager noted. "As presently designed, this job is not rich enough to challenge these people."

■ **Work redesign.** Having determined that there was a mismatch in GNS and MPS, the supervisor and the manager began the process of redesigning the job to enhance motivation. They used the framework of the five core job dimensions as their analytical approach.

Skill variety. "Concerning the tools and techniques, we have little flexibility," the supervisor said. "We could allow the use of structured programming techniques, but it

WHITESMITHS, LTD. 370 COMPILER

NOW YOU CAN RUN BOTH
C AND PASCAL ON IBM MAINFRAMES

FEATURES:

- Full implementation of the C programming language for the IBM 370/43XX/30XX
- Supports full ISO Level 0 Pascal, extended to support separate compilation
- Uses standard IBM tools to facilitate debugging in the standard IBM save area layout
- Compatible with the full range of Whitesmiths' compilers (PDP-11, VAX, 68000, 8080, and 8086)
- Provides optional cross support for MS/PC-DOS, CP/M-86, CP/M68k, and CP/M-80
- Runs under all versions of OS (VM, MVS, SVS, MVT, and MFT)
- Includes unlimited use of libraries in binary form
- Runs interactively under TSO and CMS
- Direct EBCIDIC support

Our IDEA Supermax multifunction board lets her do that at microcomputer prices.

Get the performance of a minicomputer for the price of a microcomputer with Supermax, the latest addition to the IDEAboard line.

The new IDEA Supermax gives users more memory and greater options than ever before. Now they can have an AT board that goes beyond 3MB of RAM. IDEA Supermax lets users go all the way from bare board to 4MB of memory.

And we don't stop there!

Two serial ports and one parallel port are standard with the Supermax. These powerful interfaces make your AT the kingpin of your office computing system.

And IDEA Supermax features outstanding price and performance, too.

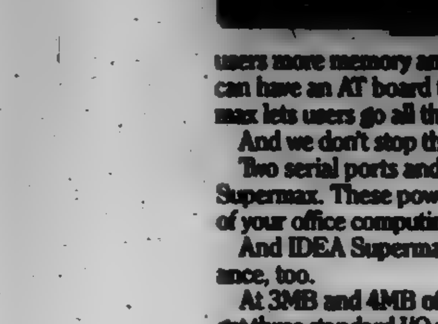
At 3MB and 4MB of RAM you save thousands of dollars and still get three standard I/O ports. That's a four figure cost advantage over the competition.

You'll never lack additional memory for integrated software applications like Symphony™ or Framework™ when you plug in Supermax. In a LAN with the AT acting as a file server, you can partition memory on the Supermax for individual users on the network. You can even combine the Supermax with our 10MB to 120MB IDEAdisks to build the AT into a desktop supercomputer.

Like every IDEAboard, the Supermax comes with our free library of software, including IDEAmenu, RAMfloppy, Printer Spooler, Diagnostics, Clock Routine, and more.

For your other applications, these IDEAboards offer the same price and performance advantages as the Supermax:

- IDEAmax 384 has 384K RAM, parallel, serial, game ports, and clock/calendar.
- IDEAmini short I/O card is perfect for the XT, Portable, and PC/3270 short slots. Your choice of two serial ports, parallel port and clock.
- IDEA Minimax has the same short slot size and holds up to 384K RAM.



So when you have a great idea for your IBM AT, look to IDEA to make it a reality.

Call 800-257-5027 for the IDEA dealer nearest you.

makes little sense to change the design when the system will soon be replaced by the new inventory system."

The manager agreed. "We can provide variety by letting them work on other applications," he said. "We could combine the teams maintaining the inventory and purchasing systems to increase skill variety for both groups. The reduction in specialization has some disadvantages, though, that might offset the benefit of increased variety."

Task identity. "We should let all three programmers review change requests instead of one screening them first," the supervisor said. "The disadvantage of the lesser experience of the other two is more than offset by enlarging task identity."

"What do you think about letting them in on the negotiation of change requests with the user?" the manager asked. "That way, they'd be in on each phase of the change process and have their task identity increased significantly."

"I agree," the supervisor said. "We can also do something similar at the tail end of the process by letting the two newer programmers participate with the other in the quality review of the completed change."

"These changes will also increase skill variety," the manager added.

Task significance. "Permitting the three to occasionally sit in on the change request negotiations should increase task significance," he added. "Can you think of other ways to help them recognize that the work they're doing is important?"

The supervisor hesitated. "That's tough. It's obvious to everyone that the new inventory system is the significant work. Although," she added, "I might arrange with the project manager on that system to invite my people in on some of the user discussions in implementation to make them more aware of the value of inventory systems to the company."

The manager brightened. "That's how we'll attack the skill variety problem, too. We'll start training them to take over the maintenance of the new system. With its on-line, data base, structured methodology and Cobol-78 characteristics, skill variety will be optimum.

"They won't be able to use these new skills for almost a year, but they will be encouraged, in that they are keeping up-to-date in their field."

Autonomy. "Our earlier ideas will increase autonomy, too," the manager said, "by letting each of them work a change request from beginning to end without intervention."

"Yes, but we can't do much about the autonomy constraint of their being confined to the existing program design and language," the supervisor said. "I'm afraid we're hamstrung on increasing autonomy otherwise."

Feedback. "The one job dimension that looks satisfactory is feedback from the job," the manager suggested. "The small tasks provide continuous feedback."

"However," the supervisor noted, "because they're not meeting schedule, the positive feeling of completing the change request is greatly reduced."

"Could you let them be involved more in the process of schedule determination? That way it's their schedule, too, not just yours," the manager asked.

The supervisor frowned. "You keep coming back to that, don't you? I've got lots of change requests to negotiate for all my groups. I just don't have the time to include all the programmers in these discussions."

"But this is your only problem group," the manager replied. "Once these job enhancements take effect, productivity should improve, and these people should begin meeting schedule. Thereafter, mutual schedule setting should be less time-consuming. Why don't you give it a try?"

■ **Results.** The problem was diminished. These job enhancements produced positive results in the programmers' output and attitudes, and complaints about peripheral issues subsided. Motivation was enhanced, and productivity increased more than 30%.

If the volume of your datacomm traffic demands 9600 bps speed, Universal Data Systems has three solutions. One of them fits your system needs.

MODEL 9600 — UDS' lowest priced 9600 bps modem is specifically designed for private line point-to-point applications. It is CCITT V.29 compatible.

MODEL 9600A/B — a strap-adaptable version of the 9600 that operates on either dial-up or dedicated lines. Enjoy the advantages of 9600 bps communication now, via the dial-up network; later, when your private lines become available, a few simple strap changes will adapt the modem to them.

MODEL 9600FP — the fastpoll version of UDS' 9600 bps modem cuts on-line training time to eight milliseconds. Since that's ½ quicker than the fastest competitive unit, this UDS device offers unmatched efficiency for polled networks.

For detailed specifications and quantity prices, contact your UDS Sales Office or distributor today! Universal Data Systems, 5000 Bradford Drive, Huntsville, AL 35805. Phone 205/837-8100. Telex 752602 UDS HTV.

QUANTITY ONE PRICES
9600........ $1,650 9600A/B..... $1,995
9600FP...... $1,995

IN DEPTH

4GLs vs. Cobol

4GL packages offer three distinct advantages over Cobol or any other third-generation language: easier customization, such as changing names of data elements; easier maintenance because there is so much less code to maintain; and easier accessibility because end users can write their own inquiries.

By Robert Morison

Software vendors are starting to announce, and even deliver, mainframe application packages written in or accessible by fourth-generation languages, or 4GLs. These include financial, human resources and manufacturing planning and control packages.

These products offer enormous potential: A good 4GL package can be quickly implemented and then modified, as no Cobol package can, to meet the unique requirements of a business. However, with these new products come new pitfalls. Systems development may be constrained not so much by the functionality of the package as by the functionality of the underlying 4GL.

These packages also will change the ways you select software, work with vendors and implement systems. The record to date of 4GL packages is limited, but it is apparent that they present an exciting alternative for application development,

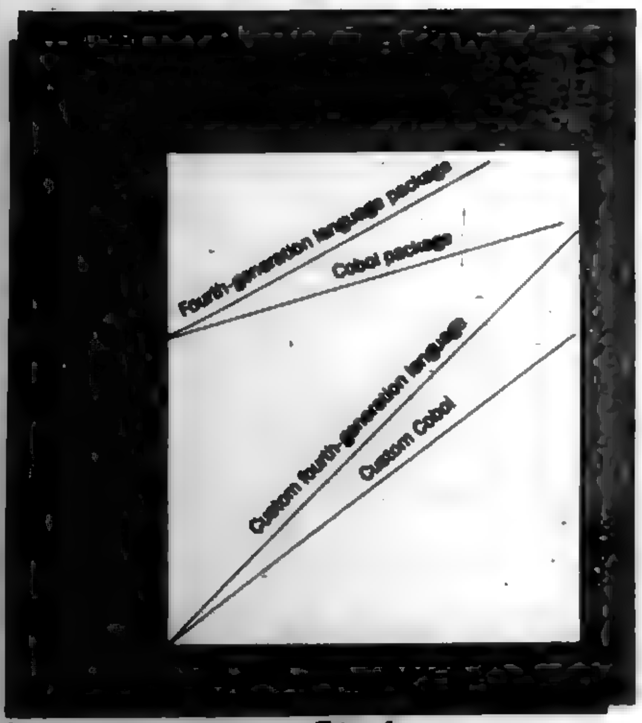

Figure 1

compared to any third-generation language.

Fourth-generation languages are essentially shorthand programming languages. An operation that requires 100 lines of code in a third-generation language such as Cobol typically requires only five to 10 lines in a 4GL. However, beyond this basic criterion of conciseness, 4GLs as a class can be difficult to describe.

Some 4GLs are nonprocedural, meaning that the programmer states only the desired results, not the method of delivering the result. Other languages are largely procedural, with familiar constructs like DOWHILE and GETNEXT. Some are true source programming languages — the statements can be interpreted on the fly and/or compiled into the functional equivalent of a load module. Others are better termed "generator languages" — the statements generate Cobol code, which is then compiled and run.

This variety notwithstanding, the practical value of 4GLs is simply stated: Using a more direct and concise programming language allows you to build applications faster and maintain them with less effort. Hence, 4GL packages offer three distinct advantages over Cobol or other third-generation language packages:

- Easier customization, whether changing names of data elements, coding custom reports or adding extended functionality.
- Easier maintenance, because there is much less code to maintain.
- Easier accessibility, because end users or information center personnel can write their own inquiries using the 4GL.

Fourth-generation language packages can dehorn an old dilemma — Do you buy a package that never really fits the business or attempt a custom implementation that consumes too much time and too many resources? A 4GL package, like the Cobol variety, presents most of your code already written. You can implement it as quickly as your organization can absorb it. But a 4GL package can then evolve into the customized system your business needs much faster than a Cobol package can be modified or a custom system developed in-house.

Figure 1 plots the relative time and resources required to fit an application's requirements for each of four approaches to development.

Take an integrated application, such as an on-line order service or production control system. Even allowing for training programmers in a new language, a custom implementation using a 4GL can generally be accomplished in under half the time required for a custom Cobol implementation. The savings come both in coding time and in time saved through prototyping.

The 4GL's relative performance naturally depends upon its robustness as a programming language. Any functions that the 4GL simply cannot handle will have to be written in Cobol, lengthening the implementation time.

A Cobol package might meet 80% or so of the application requirements to begin with, but modification can be slow and painful. Although cosmetic changes such as output formats should be easy for experienced Cobol programmers, adding data elements and modifying programs to reference them is not.

Any modifications to program logic or processing and the addition of new programs can be extremely difficult. In fact, some Cobol packages in complex applications such as manufacturing are so unwieldy that vendors themselves are finding incorporating upgrades extremely difficult.

Given the problems of modification, it is probably impossible ever to get very close to a 100% fit with a Cobol package. If anything, the business must change to fit the package's constraints, and the package cannot evolve as the business changes.

With its comparative ease of modification and extension, a 4GL package can quickly surpass the fit of a more comprehensive Cobol package. Of the four approaches mentioned above, the most direct path to full fit is to begin with a package based on a solid 4GL and then add the savings a 4GL provides in ongoing maintenance and system evolution.

The 4GL controversy

Before being taken to task for promoting a pipe dream, let me confront a primary issue surrounding 4GLs today: Can they be used as Cobol substitutes? In other words, can you build with 4GLs large production applications of the type traditionally done in Cobol? These are the core systems that help to run businesses, systems characterized by large integrated data bases and high volumes of updates.

In a recent report titled "Fourth Generation Language," International Data Corp. (IDC) reports that, contrary to vendors' marketing claims, 4GLs generally fail as Cobol substitutes: They haven't the required functionality, and they are CPU hogs.

IDC finds these 4GLs best suited for modest-size decision support and information center applications or for prototyping systems to be rewritten in Cobol [CW, Jan. 28].

These findings may stem in part from the way IDC segments the market for analysis. Another class of products, application development systems, often incorporate 4GLs as part of a series of development tools. Some of these languages are very powerful, and their vendors generally claim them to be effective Cobol substitutes. Large and complex applications are written using the application generators, but most of these are actually implemented in a combination of a 4GL and Cobol (to do what the 4GL cannot do or cannot do efficiently).

The lesson in today's market is clear: Caveat emptor. The litmus test of a 4GL's power is indeed whether it can function as a Cobol substitute. Many 4GLs fall short of their vendors' claims; nonetheless, powerful 4GLs are emerging and replacing

Strategy...

Technology

At GENIX, strategy and position have made us a successful Information Services Company.

The GENIX strategy is to provide customers with superior technology, quality system solutions, and the service that comes from a company whose corporate commitment is to ensure total customer satisfaction.

Quality

Our position stems from both experience and strength. Experience born of 15 years of working in virtually every discipline of information systems. Strength comes from our relationship with our parent, National Intergroup, a $2.3 billion diversified company.

GENIX remote computing is the most cost-effective solution for large users of advanced information services. At the terminal level our 2000 plus users enjoy 99% plus average availability and a transaction response time not usually delivered by the typical remote computing vendor.

Service

In addition, GENIX consultants are available to support the needs of the most demanding customer. In telecommunications networking, data base design, process control applications, capacity planning, hardware and software evaluation, data center design; GENIX consultants are expert in their fields.

The next move is yours. It's a strategy that can lead to success. Call 1-800-US GENIX.

Technology • Quality • Service

GENIX

Cobol on an application-by-application basis. The most powerful 4GLs are superior to Cobol in providing a more direct path to more responsive systems.

On the one hand, these 4GLs will not quickly overcome Cobol's inertia and obviously will not supplant Cobol in the near future, nor will they quickly break the Cobol maintenance backlog in most DP shops. However, ignoring proven 4GL tools can be foolish, and limiting large systems development to Cobol will only increase backlogs. With 4GL systems, the maintenance effort per application will decline, even if the absolute size of maintenance loads does not.

The move toward higher level languages, data base management systems and end-user computing is accelerating. More people are discovering firsthand the power of computers — but not by learning the power of Cobol. The trend is toward more accessible, dynamic and responsive systems. Fourth-generation languages, and especially 4GL packages, are excellent tools for such systems, both for the professional programmers who develop them and the end users who employ them.

A wide spectrum of packages

You should distinguish among three types of packages being marketed in conjunction with 4GLs.

The first is simply a Cobol package made compatible with a 4GL. You can access data either with the supplied Cobol programs or by writing new ones in the 4GL. Such a package offers the convenience of a 4GL for ad hoc inquiry and new programs, but you must maintain the system using two languages, predominantly Cobol.

The second is a hybrid Cobol/4GL package, with some supplied programs written in each. Complex functions are written in Cobol or in Cobol with some embedded 4GL statements. The 4GL tends to be used for interactive inquiries and perhaps updates, and it is available for new programs.

Such packages need close scrutiny. They enjoy the benefits of a 4GL on the surface, but maintenance and modification to the guts of the system must be done in Cobol. The limitations of the 4GL may actually dictate some of the package's functionality. For example, if all interactive programs are by definition written in the 4GL, many updates may be unnecessarily relegated to Cobol batch processing. The limits of the tool, not the needs of the application, may decide what happens when.

The third type is a package written entirely in a 4GL. The advantages for maintenance and modification are obvious. Although only a rare 4GL can serve as the source language for complex update programs and application functions, 100% 4GL packages are available today, even in applications like finance and manufacturing.

Thus, we are really talking about a sliding scale with pure 4GL packages on one end and predominantly Cobol packages on the other. The closer a package comes to pure 4GL, the greater the potential benefits in accessibility, maintenance and modification.

Figure 2

Assessing 4GL packages

The No. 1 criterion in selecting a 4GL package is obviously its applications functionality. After all, you are considering packaged software because many of your requirements are common, and a package gives you a big head start in system development. However, the traditional ways of assessing functionality must be adjusted for 4GL packages, especially if you are matching them against Cobol ones.

Package selection commonly centers on a checklist of primarily functional criteria (Figure 2), which normally reflect a combination of how the business operates today and how it would prefer to operate in the future. The vendor is asked whether the package contains each function or whether the function can be added. Each criterion has a weight, and the package a total score. By this method, the best established Cobol package with the most options frequently appears to be the best choice.

The fallacy in this approach is that, except in very standard applications, packages are seldom good fits. Yet most checklists give insufficient weight to ease of modification and maintenance. So companies purchase what appears to be the best Cobol package, which in fact provides maybe an 80% fit and no hope of coming much closer.

If your requirements are standard, if a Cobol package provides a close fit, if you have little need for modifications or end-user ad hoc access and if you do not wish to maintain the system yourself, then by all means choose the pure Cobol package. Alternatively, if the 4GL package philosophy suits you, if you have unique requirements and if your goal is really something close to a 100%

Reach over 60,000 computer professionals in Sweden.

Your ad in CW Communications' Swedish publications will introduce your company to 63,000 computer professionals in Sweden's flourishing market. According to International Data Corporation (IDC), the world's leading information industry research firm, Sweden's total data processing expenditures are expected to soar from $2.3 billion in 1983 to $6.3 billion by 1989.

Computer Sweden, the only Swedish MIS/DP publication, reaches 15,000 readers each week. Every Monday DP professionals turn to *Computer Sweden* for updates on the latest developments in hardware, software, terminals and supply products.

Svenska PC World is the magazine 12,000 IBM PC users rely on twice each month for timely information on program reviews, user reports, new products, tests and recommendations. IBM has the largest market penetration in Sweden with revenues for 1983 of nearly half a million dollars.

MikroDatorn is written specifically for the Swedish microcomputer market which, according to IDC, is growing at an annual rate of 44%. *MikroDatorn* is the monthly magazine that reaches 36,000 business/professional and home/hobby micro users with up-to-date industry information.

Get bar code/graphics capability on C.Itoh line printers.

Buy, lease or rent from MTI.

MTI offers CI-300 and CI-600 line printers with the C.Itoh Graphics Adapter Processor (GAP) option. GAP is a factory or field-installed option that permits the user to generate bar code labels and forms.

GAP-created bar code output conforms to the following industry standard groups and their associated bar code specifications:
- Automotive Industry Action Group (AIAG)
- Health Industry Bar Code Committee (HIBCC)
- Department of Defense/Logmars No. 1189A
- Wholesale/Retail Universal Product Code

MTI is an authorized C.Itoh distributor with hardware, software, expertise, even bar code readers, to meet all your bar coding needs.

Whether you buy, lease or rent, MTI is the one source for all the computer and data communications equipment, applications expertise and service you'll ever need. At great prices. Call MTI today and save.

fit, then give ease of modification some 25% of the weight in your criteria checklist.

Remember that a relatively lean 4GL package can quickly surpass the fit of a Cobol package full of often extraneous options or even the fit of a hybrid Cobol/4GL package. You must simultaneously assess the package's functionality, the amount of customization you will require and the power of the 4GL and associated DBMS for customization and maintenance.

The bottom line ultimately rules, and it must consider the total cost of producing the degree of fit your business demands plus the ongoing cost of maintenance. This financial analysis should also estimate the future business paybacks, such as improved cash flow through better control of receivables or improved profitability through reduced inventory.

These paybacks often offset the entire cost of software purchase and system development and make any marginal computer overhead associated with a 4GL insignificant. The package that can be effectively implemented more quickly will regularly outperform that which seems to have the better initial fit.

Pitfalls and considerations

Even though 4GLs represent a new technology in most companies, the pitfalls in implementing a 4GL package can be much more organizational than technical. New tools and methods may force changes in how people work. The 4GL approach spawns new expectations, both positive and negative, which must be controlled.

To end users, the 4GL package approach should mean greater opportunity to participate in designing the eventual system. All directly affected users, not just the managers who commonly land on project teams, should have the opportunity to participate.

The quick programming turnaround time with a 4GL allows users to work directly with programmer analysts to design and prototype programs and modifications. Ideally, the 4GL will be used both to do ad hoc inquiries and to work on the implementation team. End users must view the 4GL package not as just another system dropped on them but as a chance to help build a system that truly fits their needs.

Introducing a 4GL poses two problems for programmers in particular and the MIS organization in general. The first is a learning curve. A good 4GL is easy to learn — to do the simple functions vendors stress in their presentations and literature. Mastering the 4GL well enough to write complex programs may take a few months of practice. Thus, it is important to train programmers in the 4GL as early and thoroughly as possible. Note that 4GL packages offer an extraordinary aid in learning the 4GL: a cohesive set of sample programs in the package itself.

The second problem is people's natural resistance to the unfamiliar. Programmers may feel that their current skills (like Cobol) are perceived as obsolete and worry about how good some vendor's proprietary 4GL looks on a resume. Some programmers will take to the 4GL instinctively; others may be reluctant. The key here is internal education in the project's goals and how these contribute to individual productivity and growth. The challenge is to introduce a new tool while capitalizing on the experience and discipline developers already possess.

Computer operations is another group that must be solidly behind the 4GL package implementation. A new system means an added load on computing resources, and (vendor claims notwithstanding) a 4GL package will probably require more runtime resources than would a well-written Cobol equivalent. Again, check the vendor's track record with similar installations and budget for any additional hardware resources. Operations must be ready to provide needed CPU and I/O resources and to tune the application in its production environment.

Most of the burden of organizing a 4GL package implementation naturally falls on the project leader and team. Key to its success is being conservative, even though the 4GL power tempts them to be ambitious. Disciplined project management techniques are vital because the 4GL package changes the ways and speed in which some things get done. Don't let the 4GL's flexibility encourage laxness in project control.

Especially if 4GLs are new to the company, it is sensible to install the package pretty much as is, then gradually employ the 4GL's power for modifications and enhancements. Alternatively, install the package as a pilot for a segment of the business and implement and test necessary modifications before putting the package into general use.

Overcustomization may be a danger, actually prolonging implementation and undermining the purpose of using a 4GL in the first place. If possible, limit initial customization to changing names of data elements, reformatting screens and reports and adding essential data elements.

Also remember that because changes are easier with a 4GL, they can become uncoordinated more easily. Developers must work closely to avoid stepping on one another's toes, and they should use data dictionary and documentation tools to help ensure that modifications to the system are consistent. Develop clear specifications for package modifications — don't try to "ad hoc" your way to a coherent system.

This conservative approach may seem opposed to the ambitious implementation schedules that 4GL packages invite. In fact, disciplined project management will further accelerate, not delay, the implementation.

Planning for implementation

Because things can happen quickly, having a solid project plan for implementing a 4GL package is just as essential as having a project plan for developing a traditional system. The plan must take into account the new 4GL tools as well as the education and revised procedures necessary to use them effectively (Figure 3). It also must specify when to stop the initial modifications in favor of installing and shaking down the system, thus demonstrating its prowess.

The task of controlling expectations and securing cooperation rests not only on the project team but also on management. Because the organization is probably breaking new ground, management must judge whether timetables and goals are realistic. Using a 4GL package invites greater cooperation between the MIS and user communities, but any old organizational barriers must be removed carefully. A sense of complete and exclusionary ownership on either side can sidetrack the project.

Ethernet
TCP/IP for VAX/VMS™
Off the Shelf!
Complete package
for $8,795

Excelan offers a complete high-performance communications package including hardware, software, transceiver and all cables. Everything you need to perform high speed file transfers or do remote logins via Ethernet from a VAX running VMS or UNIX System V to UNIX 4.2 BSD machines and vice versa. Software includes TCP/IP protocols, and standard FTP (file transfer) and Telnet (virtual terminal) applications.

The entire VAX/VMS package is only $8,795, including the EXOS 204 Ethernet controller (quad-size Unibus board), EXOS 8040 TCP/IP software, EXOS 1100 transceiver and cables. And the entire UNIX System V package is only $7,295.

Excelan also offers similar packages for DEC PDPs, UNIX supermicros, and the IBM PC, XT and AT.

Management may have to intervene occasionally to resolve frictions and jealousies.

Top management should energize all parties by backing the project and its business objectives. They must invest the project team with a clear charter, as well as the authority and visibility to carry it out. The 4GL project must be viewed as part of the business plan, not a renegade action. Management, too, must consciously adopt the 4GL philosophy and recognize that this is not an ordinary implementation. You have purchased a vendor's package, but you are really building your own system.

Developing a 4GL package

A few years ago I was part of a vendor's team developing a 4GL package. The package, a complete manufacturing planning and control system, included standard functions such as bill of material, purchasing, and material and capacity requirements planning (MRP/CRP). It also incorporated shop floor tracking and a sales order system tied directly to factory production schedules.

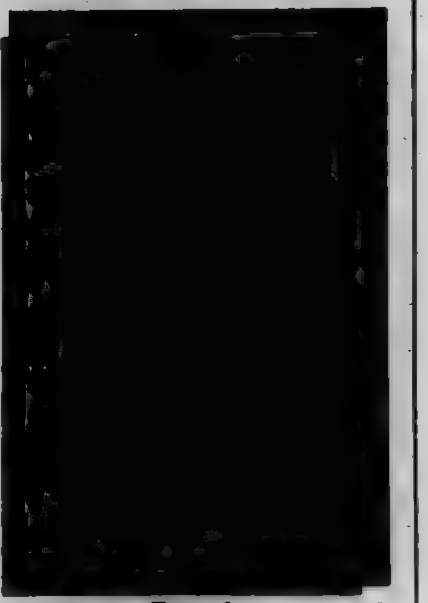

Figure 4

Pure 4GL development was possible because the language and associated DBMS, while general-purpose tools, have extensions for manufacturing application functions. The 4GL extensions include concise commands to do bill of material explosions and cost roll-ups as well as to generate MRP.

In Figure 4, for example, the TOTALIZE command is designed to roll up numeric data through all levels of a bill of material, chart of accounts or similar data structure. This simple 4GL statement replaces many hundreds of lines of Cobol and probably 50 or so lines of 4GL code using general-purpose operators.

Developing the package seems swift and easy only in retrospect, however. The team did not start with an existing package. A new tool and a new approach called for a new design. Our stated objective from the start was to build a package designed to be modified.

If the delivery vehicle was Cobol, and, hence, modification was much more difficult, we would have been obliged to incorporate dozens of additional optional features, maybe even modules. This pool of features would make for a slightly better degree of fit with each client, even though the majority of clients would ignore a majority of the features.

Instead, we decided that the package should include the most fundamental and commonly required functions and that the 4GL should be used to customize the rest of a given client's requirements. We adopted an "80% rule," whereby a function would have to be useful to 80% of the basic market (discrete manufacturers) to get into the package.

Within a chosen function, however, we vowed to provide full capability. For example, having decided to handle blanket purchase orders, we decided to include having MRP distinguish between the need to release against an old blanket order and the need to negotiate a new order.

This 80% rule was, of course, much easier to state than to adopt. The resulting package was very capable but seemed uneven in its capabilities. It had few outright "bells and whistles," but it was elaborate in many functions.

The package development, although rapid, took longer than anticipated. The 4GL accounted for much of the speed, but it accelerated prototyping and coding more than analysis and specification. It also created a propensity to revise programs constantly, even at the last minute, and tracking changes became difficult.

About 80% of the programs were simple and were coded in no time. Other programs proved tricky, both because they performed complex functions and because we were sometimes pushing the 4GL beyond its common uses. Though shorter and simpler than their Cobol equivalents, some of the 4GL programs were longer and more complex than we were accustomed to.

We alleviated many of these problems by using an application development tool, which was built as a by-product of the package development. The tool served as an extension to the DBMS' internal data dictionary as well as a repository and clearinghouse for transaction program specifications.

Developers worked on different portions of the package but used a single copy of the application development system. The latter detected inconsistencies such as redundant data elements, and it enforced standards on program documentation. It also printed up-to-date documentation at will — mercifully reducing the documentation manager's hair-tearing over last-minute program changes.

The end results — both the package itself and the demonstration that such products can, and should, be

FUJITSU
BAND PRINTERS
The Numbers are Right.

Now you can find the reliability, the quietness and the form factor you need in the new Fujitsu family of band printers. And with our M3040, M3041, M3042 and M3043 series, you have a choice of speed ranging from 300 LPM to 1200 LPM.

1200 *LPM is a Fast Band Printer.*

Each model delivers consistently crisp, high-quality characters at a speed that only a Fujitsu high-performance band printer can provide. High parts commonality is built right into every Fujitsu machine making service simple and quick. The Fujitsu band printers are surprisingly affordable and each sets a new standard in price/performance. Changing the ground rules of software selection

Consideration of a fourth-generation language (4GL) package changes not only the ground rules of software selection but also the relationship between user and vendor. An installation of a Cobol package tends to be rigid, and local modifications are relatively few. A 4GL package, on the other hand, is designed and destined to be modified. Presumably you purchased it because no Cobol package fit your needs, and you wanted to be able to change the package, not your business. The 4GL package allows rapid local modifications, and soon after installation, the system may look far different from the original package.

What happens, then, when the 4GL package vendor supplies upgrades? Using the 4GL, the vendor may be able to integrate enhancements to the package easily and often, but can you integrate them into your system? Here the 4GL is a two-edged sword, and the sharper it is, the quicker your system gets out of sync with the vendor's. A practical solution to this synchronization problem may be the disciplined use of data dictionary and application documentation tools.

In short, if your are considering 4GL packages, do not approach the 4GL package vendor the way you would a Cobol package or software tools vendor. This redefined relationship leads to three basic rules for choosing 4GL packages:

Buy a complete package, not an embryonic one. Banking on vendor "futures" is always risky, but perhaps even more so with 4GL packages. If you modify the package extensively, you may have trouble utilizing the vendor's upgrades. Beware of packages or essential modules advertised as being in alpha, beta, gamma or even omega test. Working with 4GL packages is undoubtedly a new game for the vendor, too.

Be sure the vendor has and can articulate a clear maintenance philosophy. Does the vendor's philosophy mesh with your plans for modifying the package? Does the vendor offer or recommend a data dictionary that will help you incorporate upgrades? Does the vendor provide upgrades and fixes only in the form of new programs? Or do you also receive listings of how the original programs (and your modified versions) were changed?

Recognize that you will be maintaining and enhancing your system far more than the vendor will. This should be a definite advantage: You control more of your own fate. But it also means that your staff must learn to use the 4GL and underlying data base management system. All 4GLs claim to be easy to learn, but some are deceptively difficult when you cross the threshold between simple inquiries and complex updates. Note the quality of vendor documentation, training and direct support both in the package and in the 4GL and DBMS. Remember, you will, by choice, be largely on your own.

Package assessment

Evaluating a 4GL package's ease of modification and maintenance requires two answers. First, how much of the package (and especially the portions you need to modify) is written and maintainable in the 4GL? Second, just how good is the 4GL and its associated DBMS? The latter may be of paramount importance if you have the luxury of choosing between 4GL packages. Here are some basic categories for analyzing a package's underlying technology:

4GL robustness. Can you write the most complex programs you require in the 4GL? How often must you revert to Cobol? If some functions do require Cobol, how smooth is the product's interface to same? Try to check the vendor's experience in writing packages in its own 4GL.

DBMS robustness. For complex and integrated applications, the 4GL must operate on a true DBMS, as opposed to a file manager. The distinction is that a DBMS helps you manage logical relationships between different categories of data such as orders and the items they specify. Consider the underlying data model of the product. Many 4GLs are based on the relational model, which makes them ideal for many functions but may pose practical problems when it comes to enforcing data relationships and handling high transaction volumes efficiently.

Production worthiness. Will the product allow you to run an on-line application with the simultaneous user population and on-line transaction volume you require? Vendor claims are notoriously unreliable in this area. One suspects that they benchmark themselves on very modest applications, then claim the ability to support production systems in general. For large production applications, the DBMS should approach the efficiency of, for example, IMS, just as the 4GL approaches that of Cobol. In other words, the system should handle transaction loads traditionally associated with hierarchical-model DBMS.

Application experience. Has the product been used to build the types of application functions you require? Ideally, the vendor can point to other users who have modified the package in much the same ways you plan to. Be sure to look for direct experience — presentations stressing the vendor's size, growth and number of beta sites can be a smoke screen for lack of a real track record with applications.

In short, evaluate the record of both the package itself (which is likely to be brief) and the underlying software. You must also look to the future to gauge the 4GL's ability to handle your planned modifications. Probably the best way to prove a package's viability — and probe the underbelly of the 4GL — is to arrange a trial installation. Then tackle a complex function in the package and try to modify it.

built with 4GLs — were impressive. Subsequent releases succeeded in rounding out the package's capabilities and cleaning up the inevitable bugs. In addition, the 4GL continues to be used to develop packages in manufacturing and other applications.

Users of the package are pleased with it and are enthusiastic about the 4GL approach. The package meets a good 80% of their needs and quickly evolves into the custom systems they wanted but hadn't the time and resources to develop. The major implementation problems have been organizational, not technical: Users too often adopt the 4GL package idea without selling it to management and MIS.

Breaking from tradition

Starting with 4GL packages, you can build responsive systems faster and maintain responsiveness over their full life spans. You can thus avoid the drawbacks of rigid packages — incomplete to start, impervious to change thereafter.

Despite its proven advantages, the market for 4GL packages remains embryonic. Most prospects still think "package" rather than "system." Those who consider their needs and costs over the lifetime of a system are attracted to the 4GL package. Those looking for a quick fix live by lists of immediate needs and choose Cobol packages with better initial fit. The irony is that the latter are often choosing a package that is slow to implement, never really fits and costs much more in the long run.

The 4GL packages are not widespread, and they are not for everyone. However, the organizations that are already benefiting from these packages recognise business needs that no traditional package or implementation effort can meet. To realise the great benefits of 4GL packages, they are willing to change old methods as well as old technology.

Case No. 84B 20229(HS)
Case No. 84B 20230(HS)
Chapter 7

NOTICE OF ORDER FIXING LAST DATE FOR FILING OF CLAIMS AGAINST DEBTORS IN SUPERSEDED CHAPTER 11 CASES

Cases of the above-captioned Debtors having been filed under Chapter 11 of Title 11 of the United States Code (the "Bankruptcy Code") on May 23 and May 25, 1984, respectively and the cases having been substantively consolidated by order of the Court dated November 8, 1984 and an order for conversion having been entered on February 20, 1985 directing that liquidation under Chapter 7 of the Bankruptcy Code be proceeded with, and Harvey S. Barr having been appointed Chapter 7 trustee, and the Trustee having filed a list of creditors who may have unpaid Chapter 11 obligations incurred by the debtors-in-possession.

PLEASE TAKE NOTICE THAT an order was entered in this case on July 15, 1985, by the undersigned Bankruptcy Judge, fixing October 1, 1985, as the last date for the filing of claims against Information Displays, Inc. and Intelis Incorporated, as debtors-in-possession, including all claims of the United States, any state or any subdivision thereof, in the Office of the Clerk, United States Bankruptcy Court, 101 East Post Road, White Plains, New York 10601.

PLEASE TAKE FURTHER NOTICE THAT the proofs of such claims shall be in the form prescribed by Section 501 of the Bankruptcy Code and the Bankruptcy Rules and Official Forms thereunder, and shall contain a written statement signed by the claimant setting forth the claim, the consideration therefor, what security if any is held therefor and what payment if any has been made thereon, and that the claim is justly owing from the debtors-in-possession to the creditor or his assignor or otherwise constitutes an allowable claim which arose during the aforesaid Chapter 11 case. All proofs of claim filed pursuant hereto shall be entitled in this case, shall clearly indicate the period in which the claim arose, and shall designate the address to which all notices to the creditor shall be mailed.

PLEASE TAKE FURTHER NOTICE THAT pursuant to Section 348(c) of the Bankruptcy Code, any contract which was entered into or assumed by the debtors-in-possession which was executory in whole or in part at the aforesaid date of entry of the Order converting the case to Chapter 7 shall be deemed to have been rejected unless they were expressly assumed by the Trustee on or before July 6, 1985.

PLEASE TAKE FURTHER NOTICE THAT claims arising from the rejection by the Chapter 7 Trustee as aforesaid of executory contracts entered into or assumed by said debtors-in-possession shall be filed herein in form and manner as hereinabove provided on or before October 1, 1985.

PLEASE TAKE FURTHER NOTICE THAT any claims directed to be filed by the terms of the Court's order as set forth herein, but not filed within the time herein provided, shall not be allowed and shall be barred, and Information Displays, Inc. and Intelis Incorporated, debtors-in-possession, shall be forever discharged from any liability with respect to such claims.

Dated: White Plains, New York
July 15, 1985

BY ORDER OF THE COURT

MICROCOMPUTERS

Fortune blitz boosts multiuser line

High-end SX micros, local-area net debut

By Eric Bender
CW Staff

REDWOOD CITY, Calif. — Fortune Systems Corp. significantly extended its line of AT&T Unix-based 32:16 multiuser microcomputers in late July, rolling out more than 25 products and product enhancements. All will ship this quarter, according to James Campbell, Fortune's chairman and chief executive officer, who expects the products to strengthen Fortune's recent return to profitability (see story page 72).

The debuts included the high-end Fortune 32:16 SX series, a local-area network and other communications offerings, graphics software and hardware products, window management software, a new release of the For:Pro operating system and a host of software applications from Fortune and third-party suppliers. The company also announced upgrade kits and price cuts for earlier system models.

Fortune's SX series machines support up to 24 terminals, using any combination of standard Fortune terminals, Fortune 1000 MS-DOS Workstations, Fortune 1000 Graphics Workstations or IBM Personal Computers and compatible systems, the company said. Based on a 12-MHz Motorola, Inc. 68000 processor, the systems are said to improve performance 35% over the Fortune XP, the company's previous top-of-the-line systems.

A basic $12,995 SX45 configuration includes 1M byte of internal memory, expandable to 2M bytes, a 45M-byte formatted hard disk drive, an 800K-byte floppy disk drive and the For:Pro operating system. Console, keyboard and CRT controller board are not included. The SX70, a similar model with a 70M-byte hard disk drive, sells for $14,995. Among other options, two additional 70M-byte drives can be added for $11,490. An internal 60M-byte streaming tape drive is a $2,595 option.

The Fortune:Link local-area network is based on Datapoint Corp.'s Arcnet design and can connect up to 255 32:16 systems, the company said. The controller board and networking software cost $1,795. A passive hub costs $175, and an active hub costs $1,295.

Fortune also announced communications products, including the 3270 SNA Emulator package, which emulates an IBM 3274 cluster controller, 3278 display terminal and 3287 printer. The package costs $1,195, and an Intelligent Communications Controller that acts as a Synchronous Data Link Control server costs $995. Additionally, the firm announced an implementation of the CCITT X.25 standard, with X.25 development software priced at $1,195.

Fortune:Windows, a window management package that supports up to eight active applications concurrently, is priced at $695. Extended Fortune:Word 2.1.2, an en-

Puzzles, problems and 'solutions'

SMALL TALK
Eric Bender
CW Senior Editor

Two years ago the word was "support."

Manufacturers supported distributors that supported dealers that supported customers. In short, support was everywhere. If you closed your eyes, you could imagine yourself surrounded by undergarment sales representatives or a therapy group.

Not much of that support actually was visible, but it sounded good.

Today the word is "solutions," which now seems more familiar in the computer industry than in the chemicals business. Nobody except mail-order houses sell microcomputers and software anymore.

Those of us who buy micros don't go home and tell our friends what a great solution we just bought — no, we mention the IBM Personal Computer AT compatibility and the clock speed and all that good stuff — but the phrase is not quite meaningless.

Personal computing has seen a great deal of take-the-money-and-run action from everyone in the chain of distribution, which is one of the main reasons that hundreds of thousands of desktop micros are gathering dust. All those disappointed user expectations, in turn, represent one of the main reasons for the current industry slump.

Genuine solutions to the puzzles of using micros do exist. From the seller's side, they require some pixie dust and a lot of sweat in the system design and configuration, plus continued and teeth-gritting attention to detail — and a real willingness to listen to the user.

We in the trade press don't necessarily cover these points very well, for several reasons.

For one thing, "solution" can't be defined in a press release. The reasons a system actually works fall into the cracks between the company hype and the product specifications, along with all those hidden costs.

For another, a smooth operation doesn't necessarily make a good story, lacking the classic computer-bites-man slant.

And, of course, we're all off chasing technologies that won't have widespread payoffs until the 1990s — a perennial problem in trade journalism.

See SOLUTIONS page 72

Microsoft to back memory spec

By Kathleen Sullivan
CW West Coast Bureau

BELLEVUE, Wash. — Microsoft Corp. late last month said it was joining forces with Lotus Development Corp. and Intel Corp. in support of the Lotus/Intel Expanded Memory Specification. In its statement, Microsoft announced plans to integrate expanded memory capabilities into its future systems software products.

Introduced last spring, the expanded memory specification is an interface that allows the system memory of an IBM Personal Computer, Personal Computer XT or AT to be expanded up to 8M bytes above the 640K-byte memory limit.

In conjunction with the announcement, Intel released a new version of the specification.

Enhancements in Revision 3.2

The enhancements included in Revision 3.2 allow multitasking operating systems to support more easily multiple application programs sharing expanded memory, said Rich Bader, operation manager of Intel's Personal Computer Enhancement Operation.

According to Bader, Revision 3.2 will not affect current software development efforts by companies developing products that support expanded memory. The scheme will now be known as the Lotus/Intel/Microsoft Specification, he said.

When Lotus and Intel introduced the expanded memory scheme, Intel unveiled Above Board, an add-on board that supports the expanded memory scheme and also provides specialized support for applications software that adheres to the specification.

Other hardware vendors also have introduced memory products supporting the specification.

Lotus recently began shipping a new version of Symphony that takes advantage of the expanded memory scheme, as will a new version of its 1-2-3 package scheduled for release this fall.

Other software companies have indicated their support, including Ashton-Tate, whose upcoming release of Framework will support expanded memory, and Computer Associates International, Inc.'s Micro Products Division, formerly Sorcim/IUS, which has said its Supercalc 3 will adhere to the specification.

IBM micros get ISPF/PDF

RYE BROOK, N.Y. — As an aid to programmer productivity, IBM has announced a Personal Computer implementation of its mainframe Interactive System Productivity Facility/Program Development Facility (ISPF/PDF), called ISPF/PDF PC Editor.

The package enables programmers familiar with ISPF/PDF to develop mainframe applications on a Personal Computer. Most commands in ISPF/PDF PC Editor are the same as in ISPF/PDF, and the two programs have a consistent editor, the vendor said. ISPF/PDF PC Editor allows programmers to delete, repeat, move or modify sections or lines of code or elements within a line by typing the appropriate command.

Users can transfer files from the host system to the Personal Computer, use the ISPF/PDF PC Editor, then transfer the files back to the host for further processing, IBM said.

A prerequisite for ISPF/PDF PC Editor is EZ-VU Runtime Facility, which provides a conversational interface between the user and an application program.

ISPF/PDF PC Editor requires an IBM Personal Computer with a minimum of 256K bytes of memory. The product costs $150. EZ-VU Runtime Facility is priced at $55.

More information is available from IBM at 900 King St., Rye Brook, N.Y. 10573.

Communications drivers announced for Symphony

CAMBRIDGE, Mass. — Lotus Development Corp. has announced that it will develop two communications drivers for its Symphony integrated package for the IBM Personal Computer.

The drivers reportedly will be offered free to Symphony users. One will be developed for use with the Compuserve, Inc. information utility's B protocol; the other will be for use with Communications Research Group, Inc.'s Blocked Asynchronous Transmission (Blast) communications software.

The B protocol driver will aid file transfer between Symphony and Compuserve's World of Lotus bulletin board on Lotus-related news, Lotus said.

The Blast driver reportedly will permit users to communicate with other Blast users.

Both drivers reportedly will be distributed this fall on the World of Lotus.

The Blast driver will be distributed on request to Blast users by Communications Research Group, Lotus said.

Lotus is located at 55 Cambridge Pkwy., Cambridge, Mass. 02142.

Version 2 of Chart out

BELLEVUE, Wash. — Microsoft Corp. has announced Version 2 of its Chart business graphics program for the IBM Personal Computer and compatible machines. Enhancements to the product include increased output device support and direct links to Lotus Development Corp.'s 1-2-3 and Symphony spreadsheet packages.

Microsoft Chart, first introduced in 1984, allows users to select from among 45 predefined chart formats. Users can custom design charts by moving, sizing, reformatting, adding text, overlaying charts, adding arrows and positioning all elements of the chart. The enhanced version now supports up to 128 data points and eight statistical functions, including a function that allows users to combine more than one data series, the vendor said.

With the link function, Microsoft Chart 2 allows users to execute a built-in command and transfer data directly into Chart from 1-2-3, Symphony, Microsoft's Multiplan, Dbase or other programs that utilize WKS, Data Interchange Format or text files, the vendor said. Users can also select a permanent link between Chart and other programs to allow data that is changed in that program to be automatically updated in Chart, a spokesman said.

Version 2, scheduled to ship in September, will support IBM's Enhanced Graphics Adapter, which permits the use of 16 different colors on the screen. Support has also been added for a number of output devices, including Polaroid Corp.'s Palette image recorder, Hewlett-Packard Co.'s 7510 vector film recorder, Matrix Instruments, Inc. PCR/QCR digital film recorder, Lasergraphics' advanced micrographics system and General Parametrics Corp.'s Videoshow presentation system.

Microsoft Chart Version 2 requires a Personal Computer or compatible machine with 256K bytes of memory, one double-sided disk drive and the IBM EGA, Color/Graphics Monitor Adapter or the Hercules Computer Technology Graphics Card. Version [illegible] costs $295.

Microsoft can be reached through Box 97200, 10700 Northup Way, Bellevue, Wash., 98009.

At $395, still no competition.

Micro Focus boosts line with enhanced Cobol compiler

By Jeffry Beeler
CW West Coast Bureau

CHICAGO — Micro Focus, Inc. has added to its Cobol product line with the introduction of an enhanced compiler that reportedly out-performs the company's existing offerings by fivefold to tenfold and supports all the leading Cobol dialects.

Announced last month at the National Computer Conference here, VS Cobol is aimed at the same IBM-style microcomputer users as the other compilers in the Micro Focus product line.

VS Cobol executes code three times faster than the company's previous top-of-the-line compiler, High Performance Level II Cobol, according to Micro Focus sales manager Mike McCandless.

The latest addition to the firm's compiler family also compiles twice as fast as Level II, McCandless said.

Included in the product's repertoire of supported dialects are IBM's OS/VS Cobol and VS Cobol II, Micro Focus' Level II, plus Ansi 74 and Ansi 85 Cobol, according to the company's cofounder and technical executive, Stewart Lang.

In an interview, Lang characterized VS Cobol as one of the software components that form Micro Focus' existing Workbench product, which off-loads program development tasks from mainframes to IBM-style microcomputers.

Although VS Cobol can be acquired as part of the larger Workbench package, it is also available as a stand-alone offering for first-time Cobol users or for customers who would use it as a development utility, according to Lang.

VS Cobol costs $1,600.

Micro Focus is located at 2465 E. Bayshore Road, Palo Alto, Calif. 94303.

is the "Old Fashioned" way.

Corona cuts prices

THOUSAND OAKS, Calif. — Corona Data Systems, Inc. has announced price cuts averaging 45% for its 400 series line of transportable and desktop IBM-compatible personal computers.

Two transportable micros, the PPC-400-22 and the PPC-400-XT, were reduced in price from $2,795 and $4,295, respectively, to $1,495 and $2,295. The desktop models PC-400-12, PC-400-22 and PC-400-HD2 were reduced to $1,345, $1,495 and $2,295, respectively. They had been priced at $2,445, $2,650 and $4,150.

The transportable versions each include 256K bytes of memory and a built-in 9-in. green phosphor display. The PPC-400-22 also includes two 360K-byte diskette drives, while the PPC-400-XT includes one 360K-byte diskette drive and one 10M-byte hard disk.

The desktop machines come with 256K bytes of memory but do not include a monitor. The PC-400-12 includes one 360K-byte diskette drive; the PC-400-22, two 360K-byte diskette drives; and the PC-400-HD2, one 360K-byte diskette drive and a 10M-byte hard disk. A monitor for use with any of the systems has been reduced in price from $245 to $200.

Corona Data Systems is located at 275 Hillcrest Drive, Thousand Oaks, Calif. 91360.

Large firms ignoring IBM AT's multiuser capabilities

Poll finds preference for single-user service

By Edward Warner
CW Staff

ELLICOTT CITY, Md. — Most Fortune 1,000-size firms responding to a recent survey are using the IBM Personal Computer AT as a high-powered single-user machine and only rarely as a multiuser micro. This was the finding of a report on corporate microcomputer usage trends published by the Newton-Evans Research Co. here.

The report, based on the responses of 101 DP and MIS managers, also found a strong preference for IBM micros, including a laptop portable that exists only in rumors. Specifically, IBM was mentioned as the most important future supplier of desktop micros by 96% of respondents.

Though IBM does not currently market a laptop portable personal computer, nearly 60% of respondents said they were looking to IBM to be their most important vendor of laptops in the future. Data General Corp., manufacturer of the Data General/One IBM-compatible laptop, placed second with a 50% mention rate.

According to Newton-Evans, the survey's questionnaires were mailed to 982 potential respondents and 101 actually responded. The largest group of respondents (36%) worked for firms with annual revenues of $1 billion to $2.4 billion. Thirty-two percent worked for firms with between 5,000 and 9,999 employees. Though 38% of the respondents were from industrial firms, Newton-Evans Research said the next largest group (28%) was from the financial industry and included 16 large banks and 10 insurance companies.

Half of the respondents reported more than 100 personal computers in use in their firms, and 20% of that group said they expected their firms to have more than 100 personal computers by the year's end. Ninety-eight percent of the respondents' firms had at least one IBM Personal Computer installed.

AT&T made strong showing

While IBM was picked by most respondents as their most important future desktop computer vendor, AT&T made a surprisingly strong showing by capturing second place with a 51% mention rate from respondents.

IBM's grip on the Fortune 1,000 market, however, was more strongly emphasized by the report's finding that a full 41% of respondents plan to buy personal computers from no mini or mainframe computer vendor other than Big Blue.

Of the IBM line of micros, the Personal Computer AT was the machine respondents said would be their most likely choice to buy at any time from 1985 to 1987. According to the report, 84% of respondents planned to purchase an AT during that period.

Ninety percent of the report's respondents said their firms' ATs are not currently being used nor will they be used as multiuser machines. Overall, the report said, only one-quarter of respondents have multiuser personal computer systems from any vendor, and, of those, 28% use their systems less than 30 minutes a day.

The means by which micros are acquired and disseminated in the respondents' corporations was also explored by the report.

The report found that 67% currently use an information center to educate end users. Respondents divided almost evenly, however, as to whether a formal request for proposal is required before the firm can purchase a micro.

The report, titled "Microcomputer Usage Trends in Fortune 1,000 Corporations, 1985 Edition," is priced at $750 and is available from Newton-Evans Research, Suite 204, Bethany 40 Center, 10176 Baltimore National Pike, Ellicott City, Md. 21043.

How To Triple The Speed Of Your 3270 Printer

Another Smart Solution From AVATAR

It's a sad sight. Seeing your IBM 3270 printer falling further behind every day. Outpaced by ASCII printers that deliver far greater performance at a much lower cost. ASCII printers that, until now, didn't link to your 3270 system.

Enter AVATAR's PA1500 protocol converter. It lets you attach virtually any ASCII printer directly to your 3270 network with a simple coax connection – including printers that are three times as fast as your IBM printer and cost half as much.

Now you can select the printer that matches your system needs. For greater speed, letter quality printing, better performance. Fast dot matrix or line printers. Bar code or graphics printers. Even the newest ink jet or laser printers can be a part of your 3270 network.

Together, the PA1500 and the printer of your choice give you all the capabilities of your IBM printer...and more.

So get yourself an AVATAR PA1500. And bring your 3270 printer up to speed.

Mapper package debuts for Sperry, IBM micros

ST. PAUL DE VENCE, France — Sperry Ltd.'s Information Systems Group, a unit of Sperry Corp., last month announced that its Mapper applications development system is available for use on certain Sperry and IBM microcomputers.

The product, called the Personal Mapper System (PMS), is a $2,000 hardware and software package that includes a micro version of the Mapper software used on Sperry 1100 series mainframes, officials said at a press briefing here.

PMS is a package of nine software diskettes and a standard expansion board, for use on any hard-disk model of the Sperry Personal Computer or the IBM Personal Computer XT, the vendor said.

Mapper software is designed to enable end users to develop, control and maintain forms-oriented applications programs using English language commands, the vendor said.

The PMS expansion board has a Motorola, Inc. MC68010 processor as well as a virtual-memory management unit.

More information is available from Sperry through P.O. Box 2191, Princeton, N.J. 08540.

Novell announces system software for IBM network

OREM, Utah — Novell, Inc. has introduced Advanced Netware/PCN, operating system software said to provide the features of the firm's Advanced Netware software designed for networks based on the IBM PC Network.

Advanced Netware/PCN is compatible with IBM's PC-DOS 2, 2.1, 3 and 3.1, according to a Novell spokesman. The software supports multiple file servers and Netware Bridges, which permit communications between networks with different hardware configurations, according to the vendor.

A Netware Remote feature allows remote workstations to connect via modem to an Advanced Netware/PCN network and function as fully networked workstations.

The Netware Electronic Mail Systems software also is included, according to the company.

Advanced Netware/PCN is available immediately for $1,595. A version that includes a disk interface for use with a Netware disk subsystem is priced at $1,845.

More information is available from Novell at 1170 N. Industrial Park Drive, Orem, Utah 84057.

Firm releases upgraded drives for IBM Personal Computer

BILLERICA, Mass. — Ideassociates, Inc. has added internal 40M-, 70M- and 120M-byte disk drives to its line of IBM Personal Computer storage units.

Because of limitations in IBM's PC-DOS operating system, an IBM disk controller cannot support more than 32M bytes of storage. The larger capacity drives come preformatted into multiple segments supported by Ideassociates' software. With the product, larger capacity disks can be partitioned into multiple PC-DOS drives, according to a vendor spokesman.

The products supply self-booting and disk cache features. Prices for the drives range from $1,595 to $9,995.

Ideassociates is located at 35 Dunham Road, Billerica, Mass. 01821.

How To Delight Your Lotus With Mainframe Data

Another Smart Solution From AVATAR

The idea is simple. Make your PC spreadsheet even more powerful by giving it mainframe data. But getting that data out of your mainframe, into your PC and onto your spreadsheet isn't that simple.

Until now, you've had three choices. Transfer entire files from the host and risk choking your PC with data. Not very efficient. Or find the information in printed reports, then reenter and reformat it. Very tedious. And the alternative of asking your DP department to write special host software…well, they're overburdened already. Three choices, no real solution.

Now there's TURBO, the newest micro-to-mainframe link from AVATAR.

TURBO's Data Capture lets you select just the information you need from the mainframe. And use it immediately in any of your PC applications – Lotus, dBASE, you name it. Without rekeying, reformatting, re-anything.

And you can use TURBO's host-assisted File Transfer the way file transfer was meant to be used – for sharing data with other PC users on the 3270 network.

If that isn't enough, TURBO's exclusive Macro Language adds a whole new dimension to your micro-to-mainframe link. Use Macros to automate file transfer and data capture. Better yet, massage host data even before feeding it to your spreadsheet.

So give your PC a TURBO from AVATAR. And delight your Lotus with mainframe data.

ITT INTRODUCES THE FASTEST PC IN THE WORLD. BECAUSE TIME IS MONEY.

FORTUNE

from page 61

hanced version of the vendor's word processing software that works with Fortune:Windows, debuted with a $1,495 price tag.

Fortune also introduced a monochrome graphics coprocessor board that supports 800- by 500-pixel displays and costs $1,995. A Tektronix, Inc. 401X emulator that works with the board is priced at $795. In addition, the company announced that it has adopted Graphics Software Systems' Virtual Device Interface, offering several development packages that allow users to run device-independent graphics packages. Graphics Software Systems' Drivers software will cost $295.

Release 1.8 of the For:Pro operating system was also announced. The package, available as a $150 upgrade for current multiuser Fortune customers, reportedly improves disk I/O performance and includes For:Prog, a hard disk drive optimization program.

Several CPU upgrade kits for current Fortune installations are available, with prices beginning at $2,995. Substantial price cuts for existing 32:16 systems also were disclosed, with the cost of a standard XP45 dropping from $14,995 to $9,995.

Additionally, new releases of Microsoft Corp.'s Multiplan and Graphic Communications, Inc.'s Graphwriter were announced, selling for $295 and $495, respectively, along with several other third-party software packages.

Additional information is available from Fortune, which is located at 101 Twin Dolphin Drive, Redwood City, Calif. 94065.

Fortune redirects strategy

NEW YORK — Today's Fortune Systems Corp. is a slimmed-down version of the firm that exceeded $20 million in sales in first-quarter 1983. The firm posted revenue of $14.6 million for the quarter ended this June 30.

Interviewed here two weeks ago, Fortune Chairman and Chief Executive Officer James Campbell emphasized the latest quarter's $220,000 profit. He also noted that the Redwood City, Calif., office automation vendor has maintained a 7:1 asset-to-liability ratio.

Downsizing the company to reach a level where it becomes profitable represents a shift of approach. Last summer Fortune moved toward buying North Star Computers, Inc., and "the strategy was that size is good," Campbell said. But, "I don't believe any more that putting together a $50-million company and a $70-million company makes any difference," he said. "A $120-million company doesn't have any more survivability."

Fortune now has completed the pruning required to maintain itself in healthy financial shape, Campbell said. Employment, which once reached 700, has stabilized at 330 since April, and the company has promised its employees that no more layoffs will occur this year.

The company competes in two main market arenas: multiuser AT&T Unix machines and corporate markets. In the latter, Fortune concentrates on the automotive and communications industry, which limits overall opportunities but "gives us a better win record," Campbell said.

Fortune intends to move further into the academic market. "There's a big push in the universities for Unix and C," according to Fortune Marketing Vice-President Richard Siegel.

Sales to federal agencies, which may sign very large contracts, also hold a great deal of promise, Campbell added.

— Eric Bender

SOLUTIONS

from page 61

Twenty-five years ago ocean development was high technology, and everyone and his brother was busily building little submarines or other fancy undersea toys. No one was quite sure how the equipment would pay for itself. Eventually, to most people's surprise, the offshore oil industry emerged to pay the bills for the surviving vendors.

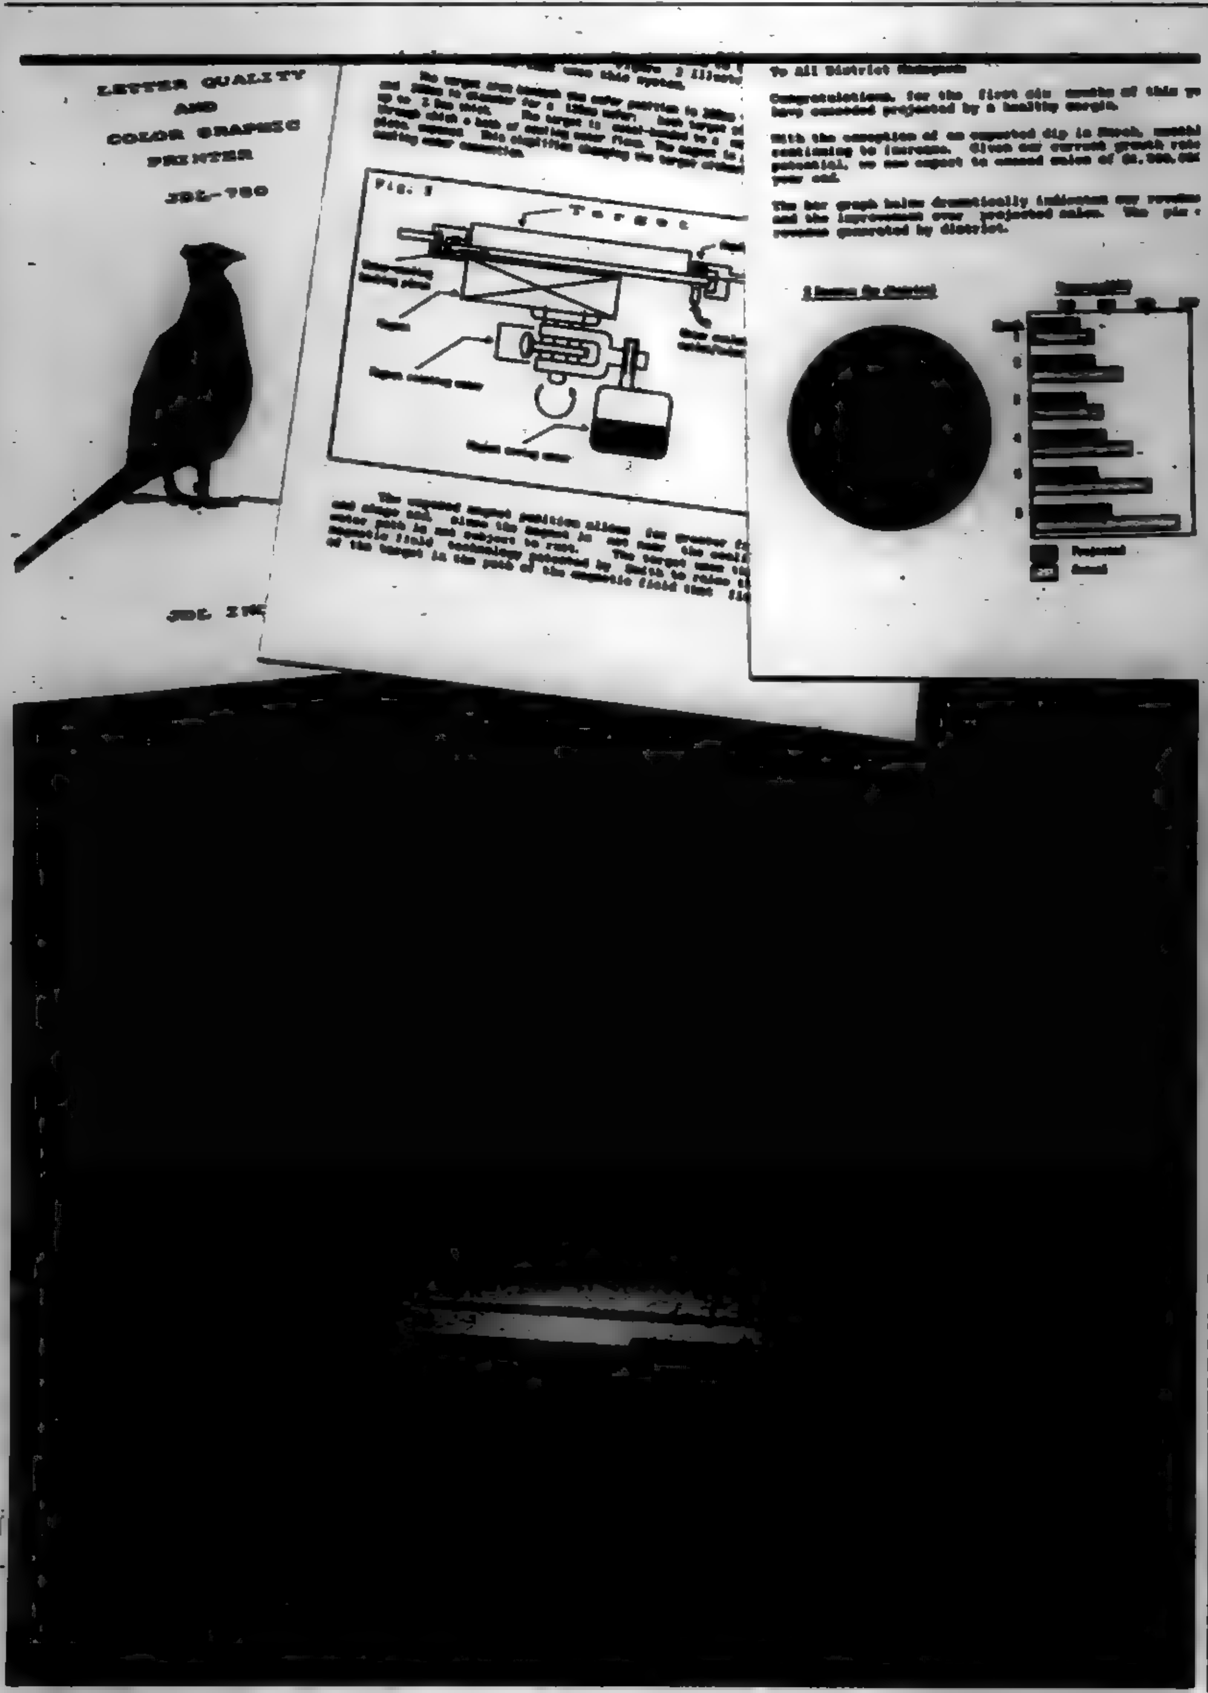
Twenty years ago firms were rushing out to buy the first commercial lasers. Those were tricky and low-power devices, and many customers found that, for a mundane task like cutting Styrofoam blocks, the devices primarily represented a fiendishly clever way of boosting the electricity bill. Over time, other firms did find important roles for lasers in manufacturing, medicine, telecommunications and other areas.

In both of these examples, the technologies received a huge amount of publicity, and multibillion-dollar markets emerged, but the lead time for a lot of practical applications was years longer than expected.

Currently in the information processing world, artificial intelligence and other emerging technologies such as image transmission and optical storage receive tremendous attention, far more than the prospects for broad, near-term acceptance conceivably could justify.

We in the press spend a lot of time writing about them because they're intriguing, and we tend to ignore the time lag between a technological achievement and useful applications of the technology. One quick example is that sales haven't risen above the noise level for any single-user software specifically tailored for the Personal Computer AT. (Please, no vendor letters.)

And often the trade press is part of the problem, not part of the solution.



COMMUNICATIONS

WEEK TAP/DANIEL MINOLI

Network documentation high priority

Documentation is generally given low priority in data communications project development efforts. While software engineering has formally introduced a documentation phase into project management and has even produced some automated tools for the task, data communications lags behind in this area.

Lack of documentation can lead to serious operational problems and, more importantly, to unnecessary expenditures, possibly totaling hundreds of thousands of dollars a year for a medium to large Fortune 500 corporation.

A previous column addressed installation delays resulting from lack of appropriate documentation [CW, July 29]. Two other considerations are communications resource management and network operation.

Accurate record keeping is essential in all companies. Studies show that telephone bills are often fraught with errors. The carriers, for example, continue to bill long-haul circuits that should have been canceled years earlier. Other typical problems involve telephone station equipment, extensions, off-premise extension facilities, special services and local loops no longer in service. These domestic and international line charges quickly add up.

So, review of toll bills normally yields savings. Often, the tracking systems needed to keep a handle on inventories and spending can pay for themselves in a short period. In one situation, a carrier was leasing over 8,000 international circuits from several other carriers and a corresponding number of entrance facilities from dozens of other domestic carriers. The yearly cost of the facilities was close to $60 million.

The record-keeping system developed for this firm was easily justified: If it identified billing errors that accounted for 0.5% of the budget, it would more than pay for itself in a single year. A 2% to 4% savings is not atypical; in the above case that would translate to $1 million and $2 million a year savings, respectively.

This type of billing review should not be carried out ad hoc — once every several years. Automated systems should be developed by the users to study communications bills on a monthly basis.

Documentation can often help expedite operational issues such as problem resolution. Sometimes, only one individual understands the network. When that person is ill or taking a vacation, no one else can solve a problem.

Network documentation can prevent these problems. Some sophisticated installations may develop a system that uses graphics in conjunction with a facilities data base to provide on-line, scrollable and navigable circuit schematics.

A multiaccess service and facilities data base that is consulted and updated by individuals who monitor the status of the network (add, delete, move, fix or upgrade) is desirable.

For an organization that does not have this capability, it would be advisable to subcontract software development and to add temporary consultants to assemble and enter the data.

The billing inconsistencies discovered by this one-time, start-up exercise would probably pay for the temporary manpower in a matter of months.

Minoli is an associate vice-president, systems planning and engineering, of Prudential-Bache Securities, Inc. in New York.

AT&T losing control of declining PBX market

Northern Telecom, NEC Telephones gain significantly, report states

NEW YORK — AT&T, once the undisputed leader in the private branch exchange market, has seen its hold on the first-place position become more tenuous recently. Northern Business Information, Inc. made that claim in "PBX Market," a 120-page report that compares PBX sales figures from 1983 and 1984. In 1984, AT&T's market share fell from 26.5% to 19.6% while Northern Telecom, Inc.'s rose from 15.9% to 19.5%.

The two giants were competing for a market that is not growing as rapidly as it has been, according to the report. In 1983, the PBX market grew by 29%, but in 1984 it increased by 18.5%, the report showed.

Another significant finding was that NEC Telephones, Inc. doubled its market share with the introduction of its latest PBX, climbing to the fifth spot behind Rolm Corp. and Mitel, Inc.

Although they are unable to manufacture PBXs, the regional operating companies played an important role. By reselling other companies' equipment, the divested Bell operating companies distributed more than 6% of the PBXs sold in 1984.

The report costs $1,475.

Northern Business is located at 157 Chambers St., New York, N.Y. 10007.

Supplier	1983	1984	% Change (by lines)
Northern Telecom, Inc.	15.9	19.5	45.0
Mitel Corp.	10.5	9.7	8.9
Others	29.3	28.8	16.4

Micom's nonblocking data private branch exchange out

SIMI VALLEY, Calif. — Micom Systems, Inc. has announced a nonblocking data private branch exchange that works with twisted-pair wiring and accomodates up to 1,016 full-duplex channels operating at speeds of up to 19.2K bit/sec.

The Instanet6000 Data PBX offers options that include interfaces for four to eight independent channels, local multiplexers supporting up to 128 devices over twisted-pair wiring, gateways for accessing IBM Systems Network Architecture/Synchronous Data Link Control or Binary Synchronous Communications networks, X.25 packet-switched networks and integral statistical multiplexers to link remote clusters of terminals or ports over a single telephone line.

System administrators can restrict access and enforce security in a variety of ways. All devices that initiate calls are assigned a list of resources that they can access, and passwords can be used to restrict access. For each password, the system administrator specifies how many attempts are allowed before the Instanet6000 Data PBX denies access and reports an attempted security violation.

System administrators configure and control the Instanet6000 Data PBX through its administration port. From a terminal connected to the administration port, the network manager can define access rights for terminals, assign names to resources, enter messages and bulletins and check network status.

Instanet6000 Data PBX pricing starts at $7,500 or $12,000 with redundancy. Interface prices range from $245 to $650 for four-channel modules, $650 to $750 for eight-channel cards, $650 to $1,500 for local multiplexers capable of supporting from four to 128 channels, $2,500 to $4,200 for statistical multiplexer modules and X.25 packet assembler/disassemblers and $3,600 to $5,400 for IBM Gateway modules. A configuration supporting 376 local terminals and ports costs $40,500.

Micom is located at 4100 Los Angeles Ave., Simi Valley, Calif. 93063.

Rumor has it you're moving up to T1.

Come back.

T1 speed.

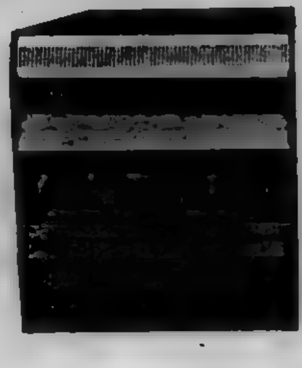
It doesn't have to be as scary a project as everyone thinks. Fact is, installing T1 can be a fairly simple chore.

We're Infotron.
We design, build, and install communications networks. Reliable. Compatible. Sophisticated T1 networks that support data and compressed digital voice.

Our newest system, InfoStream™, introduces an open architecture to T1 networking based on Infotron's long-established strengths in multiplexing and switching.

We'll take care of you every step of the way. Before. During. And after the sale.

Calm down. Dust yourself off. Then call: 800-345-4636.



INFOTRON SYSTEMS

Source data base supports speeds up to 2,400 bit/sec.

Several hundred more cities to gain access

MCLEAN, Va. — Source Telecomputing Corp. has announced 2,400 bit/sec. transmission speed support for the Source, its on-line data base service.

Prime-time usage of the 2,400 bit/sec. service is priced at 46 cent/min, 3 cents more than 1,200 bit/sec. usage. Non-prime-time use, which includes evenings after 6 p.m., weekends and holidays, will be approximately 20 cent/min, 2 cents higher than 1,200 bit/sec. prices.

Uninet, Inc. will provide service access at the higher rate to 10 cities including Los Angeles; San Francisco; Washington, D.C.; Atlanta; Chicago; Boston; Kansas City, Mo.; New York; Dallas; and Houston.

Service access will be expanded to several hundred additional cities, the company claimed, using Uninet and GTE Telenet Communications Corp.

Additional information is available from Source Telecomputing, which is located at 1616 Anderson Road, McLean, Va. 22102.

PROTOCOL CONVERTERS

■ Local Data, Inc. has announced the Barelynx/3287 protocol conversion board, which allows an industry-standard Ascii printer or comparable device to be attached to an IBM Type A coaxial device.

With Barelynx, an Ascii printer appears to the control unit as an IBM 3287 character printer. Barelynx may be used with all models and configurations of IBM 3274 and 3276 control units, a spokesman said.

A Barelynx/3287 board includes serial and parallel printer interfaces supporting a variety of interfaces. The Barelynx/3287 includes a single 10¼- by 12.7-in. printed-circuit board suitable for internal mounting.

The Barelynx/3287 is priced at $949. A portable front panel for configuring and troubleshooting a Barelynx board costs $500.

Local Data, 2771 Toledo St., Torrance, Calif. 90503.

MULTIPLEXERS/ MODEMS

■ Astrocom Corp. has added a coaxial multiplexer to its Squeezeplexer product line for IBM 3274 users.

The Astrocom E290 supports up to eight IBM Category A or compatible terminals or printers at distances up to 10,000 ft from a controller through the use of one coaxial cable instead of eight conventional cables.

The device can be used in multidrop and star network configurations and includes individual channel diagnostic fault/status indicator lights.

The E290 is priced at $795.

Astrocom, 120 W. Plato Blvd., St. Paul, Minn. 55107.

■ Gandalf Data, Inc. has announced two products for use with its GLM 528 T1 time-division multiplexer, a channel card for synchronous data transmission and a clock controller card.

The channel card enables the GLM 528 to handle synchronous data at speeds up to 64K bit/sec. and/or asynchronous data at up to 19.2K bit/sec. In addition, a controller card provides clocking to Gandalf Pacx 1000 and Pacx 2000 data-switching nodes, enabling the GLM 528 to be synchronized to these Pacx nodes for networking applications.

The existing GLM 528 multiplexers can be expanded with an asynchronous, data-only 32-channel card priced at $1,490 or with the synchronous/asynchronous 32-channel card at $1,790, the vendor said.

A basic 32-channel synchronous/asynchronous GLM 528 multiplexer is priced at $3,540, $300 more than the asynchronous-only model.

Gandalf, 1020 S. Noel, Wheeling, Ill. 60090.

LOCAL-AREA NETWORKS

■ Cabletron has announced the LAN-MD, a tool for testing components of any Ethernet and IEEE 802.3-type local network.

The LAN-MD, when used with the previously announced TDR 5000 time domain reflectometer, tests the integrity of coaxial cable on broadband and baseband local nets, including the cabling, transceivers, multiple transceivers, transceiver cables, repeaters, terminators and connectors.

The products reportedly let installers and maintenance personnel isolate faults on an Ethernet local-area network within one hour.

The LAN-MD tests Ethernet version 1, 2 and IEEE 802.3 transceiver cables over a 500-ft maximum cable length. Tests can be conducted for proper transmit, receive, collision detection, power supply, fault protection and network signal strength.

The combined cost of the TDR 5000 and the LAN-MD is $8,500, the vendor said. The LAN-MD by itself is priced at $4,000.

Cabletron, 198 Pleasant St., Ashland, Mass. 01720.

If you live in Boston and you're interested in personal computing, we have a free program for you.

All you need is a radio and a phone!

"Computerworld" is a two-way radio program designed to help you get (and give) specific information about personal computing.

In addition to bringing you regular guests, 'Computerworld" gives you the chance to exchange information with people who have experienced the same problems and pitfalls that you have — without leaving the comfort of your home.

It's a unique information service from CW Communications, the world's largest publisher of computer-related newspapers and magazines.

You can participate in "Computerworld" every Sunday night from 5 to 7 PM on WDLW radio, 1330 on your AM dial.

SYSTEMS & PERIPHERALS

Honeywell beefs up DPS 6 mini line

By Tom Henkel
CW Senior Editor

WALTHAM, Mass. — Honeywell, Inc. beefed up its DPS 6 line of minicomputers with the DPS 6/70, a processor with roughly the same performance as the firm's high-end DPS 6/75 system but offering twice as much main memory. Honeywell also unveiled a mass storage subsystem for the smaller DPS 6/22 mini.

The DPS 6/70 uses 256K-bit memory chips and comes in a cabinet half the size of that of the 60-in. DPS 6/75. It is not, however, a replacement for the DPS 6/75. A spokesman said the DPS 6/75 is field upgradable to the company's larger 32-bit DPS 6/85 and DPS 6/95 processors, while the DPS 6/70 is not.

The DPS 6/70 includes 2M bytes of main memory, 8K bytes of cache memory, a commercial instruction processor geared for enhancing Cobol performance, a 16-line communications controller with a maximum of 32 communications lines, four RS-422 ports, a disk controller that can support a 64M-byte, ¼-in. cartridge tape subsystem, a 650K-byte, 5¼-in. diskette drive and a system control facility for performing remote diagnostics and installing software updates, the company said.

Required options include either 132M-byte or 412M-byte fixed-media disk drives, which can provide a maximum of 3.3G bytes of disk storage. Other requirements include a removable-media storage device, such as a ¼-in. removable-media tape drive, a ½-in. tape drive or a removable- media disk drive, the company said.

The DPS 6/70 central system has three chassis slots that can be used for several options, including a second 16-line communications controller, a second disk controller, a multiple device controller to support attachment of high-speed line printers, a scientific instruction processor, a 9-track tape controller and up to two tape drives and a magnetic ink character recognition document handler, the company said.

The DPS 6/70 will be available in September at a base price of $30,500.

The 132M-byte fixed disk drive and 413M-byte fixed disk subsystems cost $14,500 and $21,000, respectively. The ½-in., 9-track tape controller and primary drive cost $23,900. The second tape drive costs $17,900, the company said.

Honeywell also announced a fixed-disk mass storage subsystem for the DPS 6/22. The addition increases the disk storage capacity of the DPS 6/22 from 56M to 136M bytes.

A DPS 6/22 processor configured with the newly announced mass storage subsystem includes a CPU board with memory controller, 1M byte of main memory expandable to 1.8M bytes, up to two 68M-byte fixed-media disk drives, a 650K-byte 5¼-in. diskette drive and five workstation ports. One chassis slot is available for attachment of optional devices such as a second five-port workstation/printer controller, an asychronous/synchronous dual-line communications controller or a single-line IBM High-Level Data Link Control/Synchronous Data Link Control communications controller (HDLC/SDLC).

The base price for the DPS 6/22 is

Tandem workstations, controller, emulator out

CUPERTINO, Calif. — Tandem Computers, Inc. announced two color workstations, a cluster controller and an enhanced version of its IBM 3270 emulator for the company's line of fault-tolerant transaction processing systems.

The Dynamite workstations can operate either as system terminals or as standalone microcomputers using Microsoft, Corp.'s MS-DOS operating system. Both models support a dual-mode monitor that can display both text and graphics data simultaneously. An optional bit-mapped graphics card can support three screen resolutions; a 300- by 320-pixel format, a medium resolution of 640 by 200 pixels and an 800- by 300-pixel resolution for graphics applications. The terminals feature all the standard features of other Dynamite series terminals, the company said.

The Dynamite 6548 workstation comes with dual-360K-byte floppy disk drives, and the Dynamite 6549 comes with one 360K-floppy disk drive and a 10M-byte hard disk drive. Both models come with 14-in. screens, 256K bytes of random-access memory expandable to 640K bytes and the ability to run Tandem 6530 series terminal software. The Dynamite 6548 workstation costs $3,790 and the 6549 costs $4,790. Existing users of Dynamite workstations can upgrade their units to support color monitors for $995. The optional graphics board costs $575, according to the company.

Tandem also announced the 6600 cluster controller. The unit allows clustering of terminals, which is said to reduce communications costs. The 6600 controls communications between a Tandem host processor and up to eight terminals, workstations or IBM Personal Computers and one printer. The unit can support any combination of Tandem 6530 series terminals or Dynamite series workstations, IBM Personal Computers or compatible microcomputers. The 6600 costs $3,450 for a four-port configuration. An eight-port version costs $4,250, the company said. The company also enhanced its EM3270 emula-

See [illegible] page 85

Hitachi adds storage unit

SAN BRUNO, Calif. — Hitachi America Ltd. has announced an optical disk storage product that can store up to 89G bytes of data. The OL301-2 optical disk library system costs $45,000 and is initially available only to OEMs, the company said.

The OL301-2 disk library unit was built around the 301 series optical disk drive, a write-once storage product that is said to be compatible with a variety of CPUs via either the IEEE 488 general-purpose interface bus or Small Computer Systems, Inc. (SCSI) interface buses. Included in the library unit is a formatter controller, one or two disk units and an automatic disk changer.

The optical disk library unit will be used primarily for archival applications, a spokesman said.

More information can be obtained from Hitachi at the Peripheral Systems Marketing Department, 950 Elm Ave., San Bruno, Calif. 94066.

Ramtek unwraps CAD workstations

By [illegible]
CW Staff

SANTA CLARA, Calif. — Ramtek Corp. has introduced a series of workstations for two- and three-dimensional computer-aided design applications.

The 2020-4228 desk-side unit is a Tektronix, Inc. graphics-compatible, design engineering color graphics workstation said to shorten the development time of 3-D CAD projects. It supports 3-D wireframe and finite element modeling applications using Tektronix-compatible graphics, the Graphics Kernel System and Ramtek graphics with Digital Equipment Corp.'s VT100 alphanumerics, the vendor said.

The 2020-4228 contains a Motorola, Inc., MC68010-based board that performs internal processing. It also contains a 2020 series Motorola 68000-based display list processor board for performing floating-point coordinate transformation and floating-point geometry computation functions. According to the vendor, 750K bytes of random-access memory, expandable in 1M-byte increments up to 5M bytes, allows the user to store Ramtek 3-D graphics display

See CAD page 85

Silicon Graphics Iris 2400 Turbo Option debuts

MOUNTAIN VIEW, Calif. — Silicon Graphics, Inc. has announced an enhanced version of its Iris Series 2000 graphics workstations, dubbed the Iris 2400 Turbo Option, based on the Motorola, Inc. 68020 microprocessor.

The Iris 2400 Turbo Option comes with 2M bytes to 4M bytes of memory and an optional floating-point processor board. The 2400 Turbo Option includes a software upgrade for faster file handling and very large-scale integration (VLSI) geometry engines that increase three-dimensional transformations by 33% — to 80,000 per second — over the Iris 2400, according to the vendor.

The Turbo Option's CPU uses a 32-bit data path to memory, and the memory boards use 256K-byte random-access memory chips.

The product's software upgrade requires no source code changes from the company's AT&T Unix 2.3 release, and it is based on the University of California at Berkeley's 4.2 version of Unix. The 240 Turbo Option, including CPU board and 2M-

Versatec unveils color plotters, graphics controller

RPM can handle more than 15,000 vector/sec.

SANTA CLARA, Calif. — Versatec, Inc. has announced two electrostatic color plotters for 24-in. and 36-in. wide media and a modular graphics processing controller called the Raster Plotting Machine (RPM).

The RPM controller drives the newly announced electrostatic plotters, off-loads the host processor and orders and rasterizes graphics data. The RPM can handle more than 15,000 vector/sec., according to the vendor.

Up to 4M bytes of dual-ported memory per modular board is said to increase bandwidth and prevent contention.

Upgraded with add-in processors

The modular RPM series can be upgraded with add-in processors and memory up to 14M bytes. Disk drive storage can be expanded to 140M bytes.

The RPM controllers cost from $16,000.

The color plotters operate at up to 1 in./sec. with a resolution of 200 point/in. on paper or film. The 24-in. model can plot a D-size color drawing in 5¼ minutes. The 36-in. model can plot an E-size color drawing in 6¼ minutes, the vendor said.

The plotters use a multipass technique to produce multicolor plots, eliminating the need for multiple writing heads and associated electronics, the vendor said. The color plotting software provides for seven line colors and 256 predefined area colors.

The 24-in. plotter costs $49,900, and the 36-in. model costs $72,200.

An enhanced accuracy option for the company's 7000 series of monochrome electrostatic plotters is also available.

The option reportedly makes adjustments for changes in the media and humidity. Adjustments are self-calibrated on the plotter through the control panel. The option is priced at $4,900, according to the vendor.

An automatic media cutter for the 7000 series is said to eliminate the need for a manual operator to cut plots.

Automatically deposited in bin

Once the plots are cut by the cutter and mounted on top of the plotter in place of the media winder, they are automatically deposited into a wire bin.

Cuts are initiated at the end of a plot or through a special command and are made within a ½ in. of the desired area. The cutter is available for $3,750.

Versatec is located at 2710 Walsh Ave., Santa Clara, Calif. 95051.

ITT processor targets IBM 3270, PBX users

PHOENIX — ITT Courier Terminal Systems, Inc. has introduced an applications processor system for local processing targeted at users of IBM 3270 workstations and voice/data private branch exchanges.

The ITT applications processor is said to give terminal users the option of communicating on-line with the 3270 host computer or accessing the local processing power of the applications processor.

The product connects to an IBM host computer via an ITT 9400 series controller and can provide port connections for up to 32 terminals and printers from the ITT 9000 product line. According to the vendor, up to 16 devices can simultaneously access Microsoft Corp. Xenix-based applications.

Users of the 3270 can log on to the applications processor and toggle back and forth between local applications and a mainframe 3270 session.

The applications processor includes an Intel Corp. 80286-based CPU board, ISBC 214 intelligent I/O board, 1M byte of directly addressable random-access memory expandable to 13M bytes and up to 300M bytes of storage. The unit can include a 1.2M-byte floppy disk drive, 60M-byte streaming tape drive, four 5¼-in. hard disk drives, 12 Multibus boards, a Centronics Data Computer Corp.-compatible parallel printer port and an RS-232C asynchronous terminal port.

Model I of the applications processor costs $18,500 and includes a 20M-byte fixed disk drive. Model II costs $24,000 and includes a 60M-byte fixed disk drive and a 60M-byte tape streamer. Both come standard with the Xenix 286 operating system, a 1.2M-byte floppy disk drive, a Centronics-compatible parallel printer port, an RS-232C asynchronous terminal port and a device adapter that supports eight coaxial attached devices.

ITT Courier Terminal Systems is located at 1515 West 14th St., Tempe, Ariz. 85281.

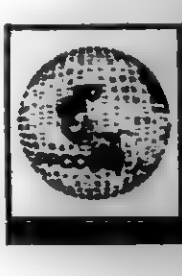
Cadmus unit gets upgrade

LOWELL, Mass. — Cadmus Computer Systems has announced a version of its OEM-oriented engineering workstation that incorporates a Motorola, Inc. 68020 microprocessor.

The Cadmus 9800 uses the 16.7-MHz version of the 68020 said to offer a 300% performance improvement over earlier workstations based on Motorola's 68010 chip.

The Cadmus 9800, including 1M byte of random-access memory, memory management unit, small computer systems interface and VME interface, a 40M-byte Winchester disk drive and controller, a 5¼-in. floppy disk drive and controller, the company's Cadmac graphics subsystem, a VME card cage with 10 slots, two RS-232C communications lines, and AT&T's Unix System V operating system costs $21,500. Deliveries will begin in the fourth quarter.

The company is located at 600 Suffolk St., Lowell, Mass. 01852.



You could win $1000 in the first international computer-generated art contest

CW Communications, Inc. — the world's leading publisher of computer-related newspapers and magazines — is proud to announce its sponsorship of the very first international computer-generated art contest.

All entries must be computer-generated, mounted, and suitable for display. Entries will be judged primarily on their artistic merit, but execution will also be taken into account. Two prizes will be awarded. The winning individual will receive $1,000 (U.S.). The winning organization will receive a trophy.

Winners will be announced during the First Pan Pacific Computer Conference (in Melbourne, Australia, this September 10-13). All entries will be put on display in a special exhibit at this conference.

Enter today. Send your entry to:
The First Pan Pacific
Computer Art Competition
P.O. Box 212 (11 The Avenue)
Hampton, Victoria; Australia 3188.

Entries must be received by August 23rd

FIRST PAN PACIFIC COMPUTER CONFERENCE / CW COMMUNICATIONS

Honeywell has better office integration than Wang or IBM.

That's right.

Introducing The Honeywell Office

Honeywell is about to change the way you think about office automation.

Because standalone and non-compatible product lines aren't enough to provide the most dramatic increases in productivity and corporate profitability.

The biggest increases in performance can only come from office automation capabilities like integration and networking that allow all systems to "talk" to each other—which is why we designed The Honeywell Office.

The Honeywell Office integrates office processing, data processing, networking and communications, and distributes these resources across a single, compatible product line of micros, minis, and superminis.

It's the reason why one customer credited our approach to office integration with helping to increase sales by 50%.

Here's how The Honeywell Office can help you manage and direct your information resources more efficiently.

Unsurpassed Office Processing

We started with competitive word processing in virtually every area and developed superiority in the crucial area of file management.

INFOCALC, our three dimensional spreadsheet, lets you merge financial data and text.

Honeywell ties PC processing and terminals into one departmental system.

But we didn't stop there.

We integrated decision support tools and distributed networking capabilities so that your departments can transfer, share, and combine office and data processing information with simple commands. Without unnecessary steps. Without costly duplication of efforts.

InfoCalc, our integrated spreadsheet, lets managers access information from the department across the country as easily as the sales office from across the corridor.

There is also a database management capability that allows professionals to set up their own departmental databases.

And that's only half of it.

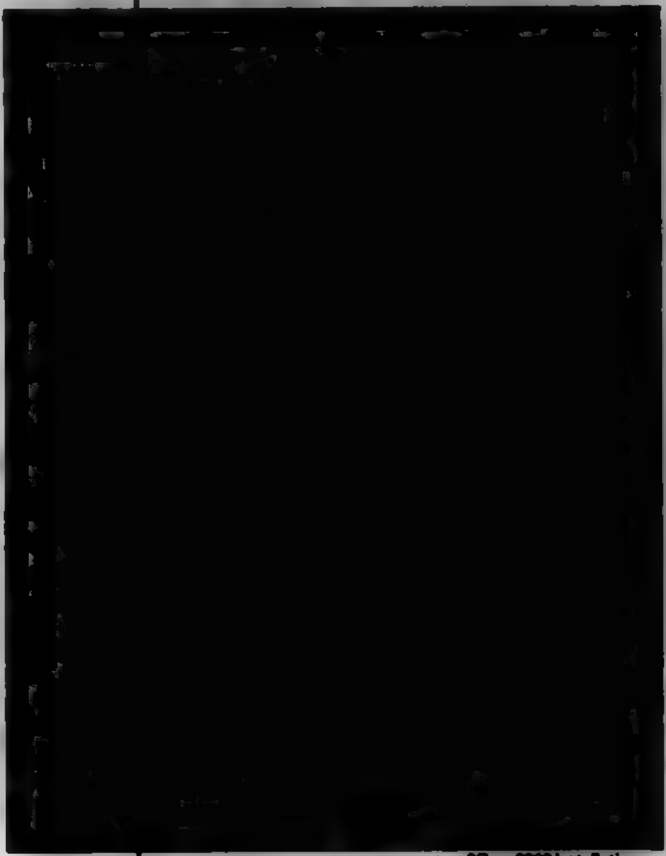
The other half is how *well* it integrates the office side of your business with the data processing side.

Flexible Data Processing

No word processing vendor can integrate the extensive array of data processing products you'll find with The Honeywell Office.

The Honeywell Office provides unrivaled flexibility by combining office and data processing into one distributed, departmental system. It supplies integrated transaction processing, database management, program development tools, query and report, data entry and specialized industry applications.

So now your accounting, marketing, and other departments can access and control their information.



*Over 2000 installations.

And when it comes to writing new applications, we offer a full complement of programming languages that include BASIC, COBOL, FORTRAN, ASSEMBLY, ADA, C, RPG, and PASCAL.

Quite simply, The Honeywell Office gives you a better growth path, stronger database management, and greater systems flexibility than our competitors.

Honeywell.

Advanced networking lets you connect all your departments.

Integrated Networking and Communications

Honeywell expertise in networking and communications helped the Metropolitan Life Insurance Company create one of the largest distributed branch office networks of its kind.

Over 1300 Met Life district sales offices in North America are automated using our DPS 6 minicomputers, linked through an SNA network that supplies reliable branch office-to-IBM host communications.

Unlike competitors who require mainframes for network control, we aren't limited to creating star networks. Our ISO based Distributed Systems Architecture (DSA), gives you the flexibility to configure ring, mesh, peer-to-peer, and other styles of networks.

Honeywell's complete micro to supermini compatibility means flexible, economic growth.

For local and remote user-to-user communications, our integrated electronic mail helps minimize network costs by letting you route your mail and documents in economical quantities, and prioritizes transmission by time of day.

Finally, The Honeywell Office lets you access network services such as CompuServe, Dow Jones, The Source and Westlaw right from your desktop.

Complete Micro to Mini to Supermini Compatibility

From the very beginning, The Honeywell Office was designed for complete compatibility from top to bottom. Compatible hardware. Compatible software. And compatible communications facilities.

One consistent interface is presented to all systems, small and large, permitting the virtually limitless exchange of information. Standard menus and prompts provide major user training benefits. Upgrade options are more flexible and economical because all systems can be linked together.

Service and Support that Make All Systems Go

The Honeywell Office is backed by TotalCare,™ our comprehensive nationwide support program.

Uptime, after all, is everything, and TotalCare™ provides everything you need in programs and services that can be tailored to help meet your requirements.

The Honeywell Office The Smarter Choice

The Honeywell Office reflects a strong commitment and adherence to a standard interface, state-of-the-art technology, and a modular, open ended design, so that your office can grow as your needs do.

SYSTEMS & PERIPHERALS

PROCESSORS

■ AMF Logic Sciences has introduced a vector-to-raster graphics processor that converts graphics data supplied by a host computer into a format that can be output to a variety of ink-jet, electrostatic and laser printers and plotters.

Turbograph 700 is a stand-alone processor for processing either monochromatic or color graphics data. It includes a very large-scale integration graphics engine and user-configurable I/O options. It can draw up to 400,000 vector/sec., the vendor said.

Geared for computer-aided design, manufacturing and engineering applications, Turbograph 700 allows users to define graphics elements for custom-tailored output. Shaded areas can be filled with patterns selected by the user.

Raster image memory and input memory are expandable to up to 2M bytes each. Optional interfaces include the RS-232C 9.6K bit/sec. serial interface and the Centronics Data Computer Corp. 8-bit parallel interface, the vendor said.

Turbograph 700 costs $6,995.

AMF Logic Sciences, 10808 Fallstone Road, Houston, Texas 77099.

DATA STORAGE

■ System Industries, Inc. has announced Winchester disk drives for Digital Equipment Corp., Data General Corp. and Hewlett-Packard Co. minicomputers.

The 9733 offers a transfer rate of 2.458M byte/sec., a 28.3-msec average access time and 337M bytes of unformatted capacity. The 9733 can be used within a System Industries cluster that supports a number of drives, allowing multiple CPUs to access a large common data base.

The 9733 is priced at $10,100, including all hardware and cables needed.

System Industries, 1855 Barber Lane, Milpitas, Calif. 95035.

TERMINALS

■ Ann Arbor Terminals, Inc. has announced an Ansi X3.64 standard alphanumeric and graphics terminal that is said to be compatible with the Tektronix, Inc. 4010 and 4014 with enhancements of the Digital Equipment Corp. VT640.

The Ambassador GXL Plus adds a user-definable character set to the previous capabilities of the GXL. Characters can be preset with graphics instructions, including alternate fonts, schematic symbols or layers of graphics displays.

The terminal includes a 15-in. green phosphor screen with 768- by 600-pixel resolution.

The standard configuration features 18- to 60-line by 80-char. display, two pages of memory, editing capabilities and transmission speeds of 110 to 19.2K bit/sec., according to the vendor.

The product reportedly supports graphics packages such as Tektronix Plot-10, Issco Graphics' Disspla and Tell-A-Graph and SAS Institute, Inc.'s SAS/Graph.

Cost of the GXL Plus is $3,950.

Ann Arbor Terminals, 6175 Jackson Road, Ann Arbor, Mich. 48103.

■ Falco Data Products, Inc. has released its Fame 1078 terminal designed for use in local-area network and protocol converter systems.

The Fame 1078 features an IBM-style keyboard, Digital Equipment Corp. VT102, VT100 and VT52 terminal emulation and IBM 3278 compatibility through the use of a protocol converter.

DEC's PF keys one through four are included. The unit features two pages of memory, 24 shiftable PF keys, double-width, double-height characters and a 14-in. screen. Split-screen operation is said to be standard, as are a pair of independently configured RS-232C communication ports.

It costs $1,095.

Falco Data Products, 1286 Lawrence Station Road, Sunnyvale, Calif. 94089.

■ CIE Terminals, Inc. has introduced an enhanced keyboard for its Digital Equipment Corp. VT220-compatible CIT-220+ monochrome terminal.

The keyboard includes Escape, Backspace and Linefeed keys that allow users to execute special functions in applications programs, editors and operating systems, the vendor said. The keys are also functional in the terminal's VT52, VT100 and VT220 operating modes.

CIE's keyboard includes a Shift-lock LED. The keyboard will be shipped with all CIT-220+ terminals, which are priced at $995.

CIE Terminals, 2505 McCabe Way, Irvine, Calif. 92714.

■ C. Itoh Electronics, Inc. has introduced a series of 14- to 19-in. monochrome and color monitors.

The QMD-1535 is a 15-in. screen monochrome monitor with a dot/line resolution of 750 by 790 pixels and a 0.31 dot pitch. It includes a 256 by 192 display size and is priced at $550.

The QMD-1735 is a 17-in. monochrome monitor with the same resolution and pitch as the 15-in. monitor. It has a diplay size of 300 by 225 pixels, the vendor said. Both monochrome monitors have a 50-MHz video bandwidth and weigh 22 lb. Monitors are available in green, amber and white phosphors.

C. Itoh's QCD-1455 is a 14-in. screen with a dot/line resolution of 720 by 790 pixels, 0.31 dot pitch and a 240- by 180-pixel display. It can display up to 27 colors and includes a 50-MHz frequency raster scanning

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in over 25 countries is the largest in existence. Over 9,000,000 computer-involved people around the world rely on our publications for the information they need to stay ahead.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diana La Muraglia today if you want to reach the computer buyers in any of the following countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom, Venezuela and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

system. The QCD-1455 is priced at $840.

The QCD-2011 is a 19-in. color monitor with 1,280- by 1,024-dot resolution and a 120-MHz video bandwidth. It has a display size of 338 by 270 pixels and a 0.31 dot pitch. The QCD-2011 is priced at $3,000.

C. Itoh Electronics, 5301 Beethoven St., Los Angeles, Calif. 90066.

PRINTERS/ PLOTTERS

■ **Televideo Systems, Inc. has introduced two daisywheel printers for use with personal computers.**

The TP 760 printer is an enhanced version of Televideo's TP 750 unit. It prints bidirectionally, and it is compatible with the Diablo Systems, Inc. 630 API command set.

The TP 780 letter-quality daisywheel printer features bold and shadow print and is compatible with the Diablo 630 API command set.

The TP 760 costs $419. The TP 780 costs $1,195.

Televideo Systems, P.O. Box 6602, 550 E. Brokaw Road, San Jose, Calif. 95150.

■ **Philips Peripherals, Inc. has introduced its Elpho 20 nonimpact page matrix printer.**

The Elpho 20 is said to produce letter-quality resolution for text and graphics by using electrophotographic recording technology, the vendor said. The machine, which was designed for use in a clustered workstation environment, is said to print 20 page/min with a noise level of less than 50db.

The system has both parallel and serial RS-232 interfaces. The RS-232 interface transfers data at up to 19.2K bit/sec. in full duplex mode.

The system costs $24,900 for the printer with a paper-feed module, a sorter, a paper cassette and toner. The printer alone costs $19,800.

Philips Peripherals, Unit 12, 385 Oyster Point Blvd. S., San Francisco, Calif. 94080.

■ **Dataproducts Corp. has announced three laser printers for its LZR-2600 product line: the LZR-2660, LZR-2665 and LZR-2630 daisywheel emulator model, compatible with the Diablo Systems, Inc. 630 printers.**

The LZR-2660 and LZR-2665 use the Postscript page composition language developed by Adobe Systems, Inc. Postscript is a page description language with bit-mapped image graphics capabilities, containing 13 resident type fonts that can be scaled to any size and placed in any orientation on the page.

The LZR-2630 can be used to replace several daisywheel printers. It can mix up to 64 resident, on-line type fonts on the same page.

All three models feature two input paper cassettes and a manual feed tray.

The LCR-2630 is priced at $14,900, the LZR-2660 is priced at $20,900, and the LZR-2665 is priced at $22,900.

Dataproducts, 6200 Canoga Ave., Woodland Hills, Calif. 91365.

OFFICE SYSTEMS

■ **NBI, Inc. has announced three products that reportedly expand its office automation systems capabilities in document management, micro networking and office communications.**

The Oasys 64/ES cluster integrated control unit is a shared resource system for clustering word processing and personal computing workstations.

It provides 1M byte of memory and is available with 38M, 76M or 168M bytes of disk storage.

Oasys 64/ES is priced from $14,900 to $31,400.

The Team-Up data base management system reportedly allows users to access, update and manage specialized departmental data base applications. Team-Up may be used with any Oasys 2000 workstation attached to the Oasys 64 or 64/ES.

It costs $795 to $2,795.

Multinet Office-Link is an adapter that reportedly allows nodes in an NBI local-area network to be connected with standard telephone wiring instead of special cabling. It allows workstations to be connected to Oasys 64 and Oasys 64/ES interface control units.

Each Multinet Office-Link allows attachment of eight workstations and is priced at $395.

NBI, P.O. Box 9001, Boulder, Colo. 80301.

Our network can give your network the right connections.

Now there's an easy way to open your company's data network to new opportunities.

Connect your network to our network– the IBM Information Network. It's your connection to a number of computers—from small personal computers to large mainframes, both inside and outside your company.

And our network enables your company to do business in new ways, with new levels of sophistication.

Your Connection to Customers, Suppliers and Dealers

Through our network you can hook up to your customers, suppliers and dealers. And how will that benefit you?

One way might be a system of automatic reordering that could give all parties the advantages of leaner inventories and greatly reduced paperwork. You'll be able to coordinate on-demand delivery dates and production schedules. And to exchange drawings and technical specifications to speed the process.

Your Connection to Industry Networks

There are also cases where an industry benefits from the efficient exchange of information.

In the property and casualty insur-

CAD

from page 77

lists and graphics picture segments. Base price of the 2020-4228 is $17,995.

Ramtek also announced the 2020-4225 Tektronix-compatible desktop workstation for two-dimensional design applications. The product uses Ramtek's advanced architecture and very large-scale integration circuits and can perform segment creation and editing functions as well as pan and zoom functions, the vendor said.

The 2020-4225 can emulate Digital Equipment Corp.'s VT100 alphanumeric capabilities. The product drives a high-resolution, color raster display monitor and permits a four-color display. A standard RS-232C serial host interface permits asynchronous communications up to 19.2K bit/sec. Base price of the Ramtek 2020-4225 is $10,995.

The company also announced a display controller that reportedly can integrate computer graphics into custom configurations for two-dimensional drafting applications. Ramtek's 2020-4220 can support high-resolution graphics on the IBM Personal Computer and Personal Computer AT, the vendor said. The 2020-4220 is priced at $6,995.

For additional information, Ramtek is located at 2211 Lawson Lane, Santa Clara, Calif. 95050.

TURBO

from page 77

byte memory board, is priced at $6,000. The floating-point processor board costs $7,500. The product is scheduled for fourth-quarter availability.

The company also announced the Iris 2300 Unix-based terminal for its 2000 family of graphics workstations. The product is based on the company's Unix implementation and a Motorola, Inc. 68010 microprocessor.

The Iris 2300 was designed to run a terminal emulator program under the company's Unix version, allowing programs developed on the company's stand-alone engineering workstations to run on the Iris 2300 without modification.

The Iris 2300 terminal includes two disk drives, a 20M-byte Winchester disk system and a floppy disk drive for loading software. The product uses the company's Geometry Engine and Geometry Accelerator, two proprietary VLSI circuits that allow the Iris 2300 to perform real-time 3-D graphics computations.

The Iris 2300 is priced at $39,500 and is scheduled for availability this month.

Silicon Graphics is located at 630 Clyde Court, Mountain View, Calif. 94043.

MINIS

from page 77

$15,995. A second 68M-byte fixed-disk subsystem and controller costs $5,000. An upgrade kit, which allows DPS 6/22 users to replace an existing 28M-byte fixed-disk subsystem and controller with the newly announced 68M-byte counterpart, costs $7,000. A 64M-byte cartridge tape unit and controller costs $2,700 and memory upgrades to the 1.5M-byte maximum are made in 256K- and 512K-byte increments, which cost $1,750 and $3,500 respectively.

A dual-line communications controller costs $1,250, a second workstation/printer controller and five RS-422 ports costs $1,500, and an HDLC/SDLC controller costs $2,200. A two-slot expansion chassis costs $1,000. The products will be available in September.

The vendor is located at 200 Smith St., Waltham, Mass. 02154.

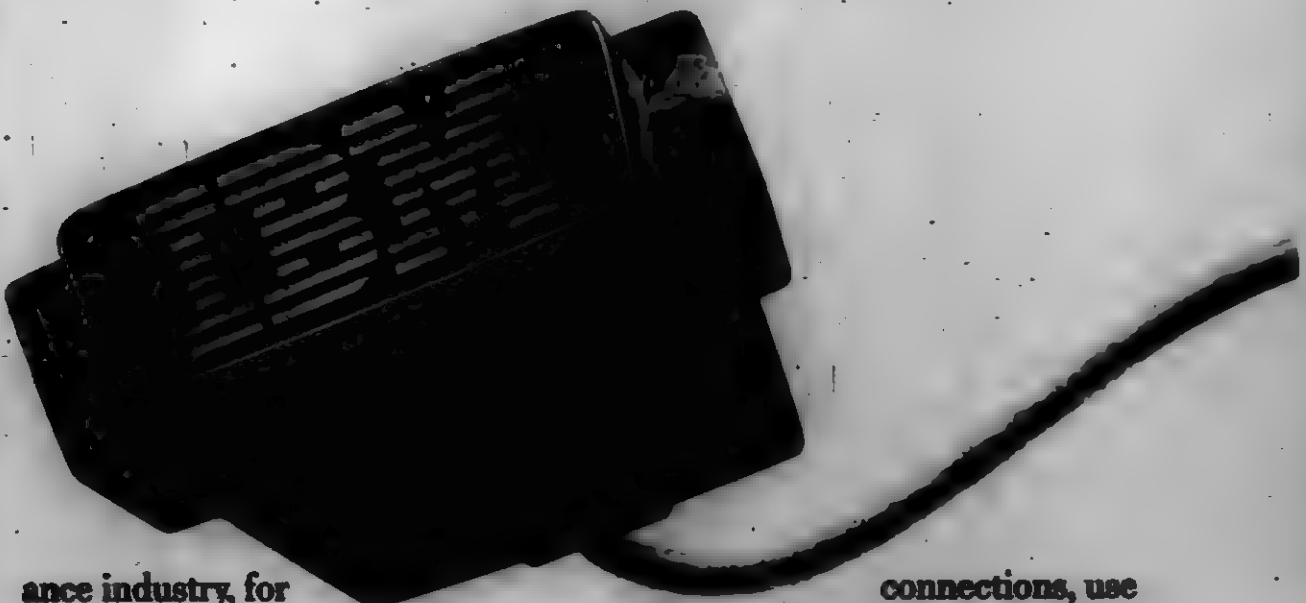
UNITS

from page 77

tion package. The enhancement allows Tandem users to access, from a single terminal, 3270 applications from up to six IBM host processors via IBM's Systems Network Architecture (SNA) or binary synchronous protocols. Users of Tandem 6530 series terminals, Dynamite 6540 series workstations or IBM Personal Computers can run IBM 3270 and Tandem applications at the same time. Those users can also alternate between IBM SNA and binary synchronous host processors through the use of menus. The enhanced emulator has a license fee of $500 for new licenses; however it is a no-charge upgrade for current users of Tandem's 3270 emulation package.

All four products are available immediately.

Tandem is located at 19333 Vallco Pkwy., Cupertino, Calif. 95014.



ance industry, for example, the IBM Information Network improves communications between major underwriters and independent agents.

Your Connection to Data Bases and Software

The IBM Information Network also makes other information and resources available.

These can include data bases such as Dow Jones News/Retrieval,* as well as access to software products for the business and data processing professional.

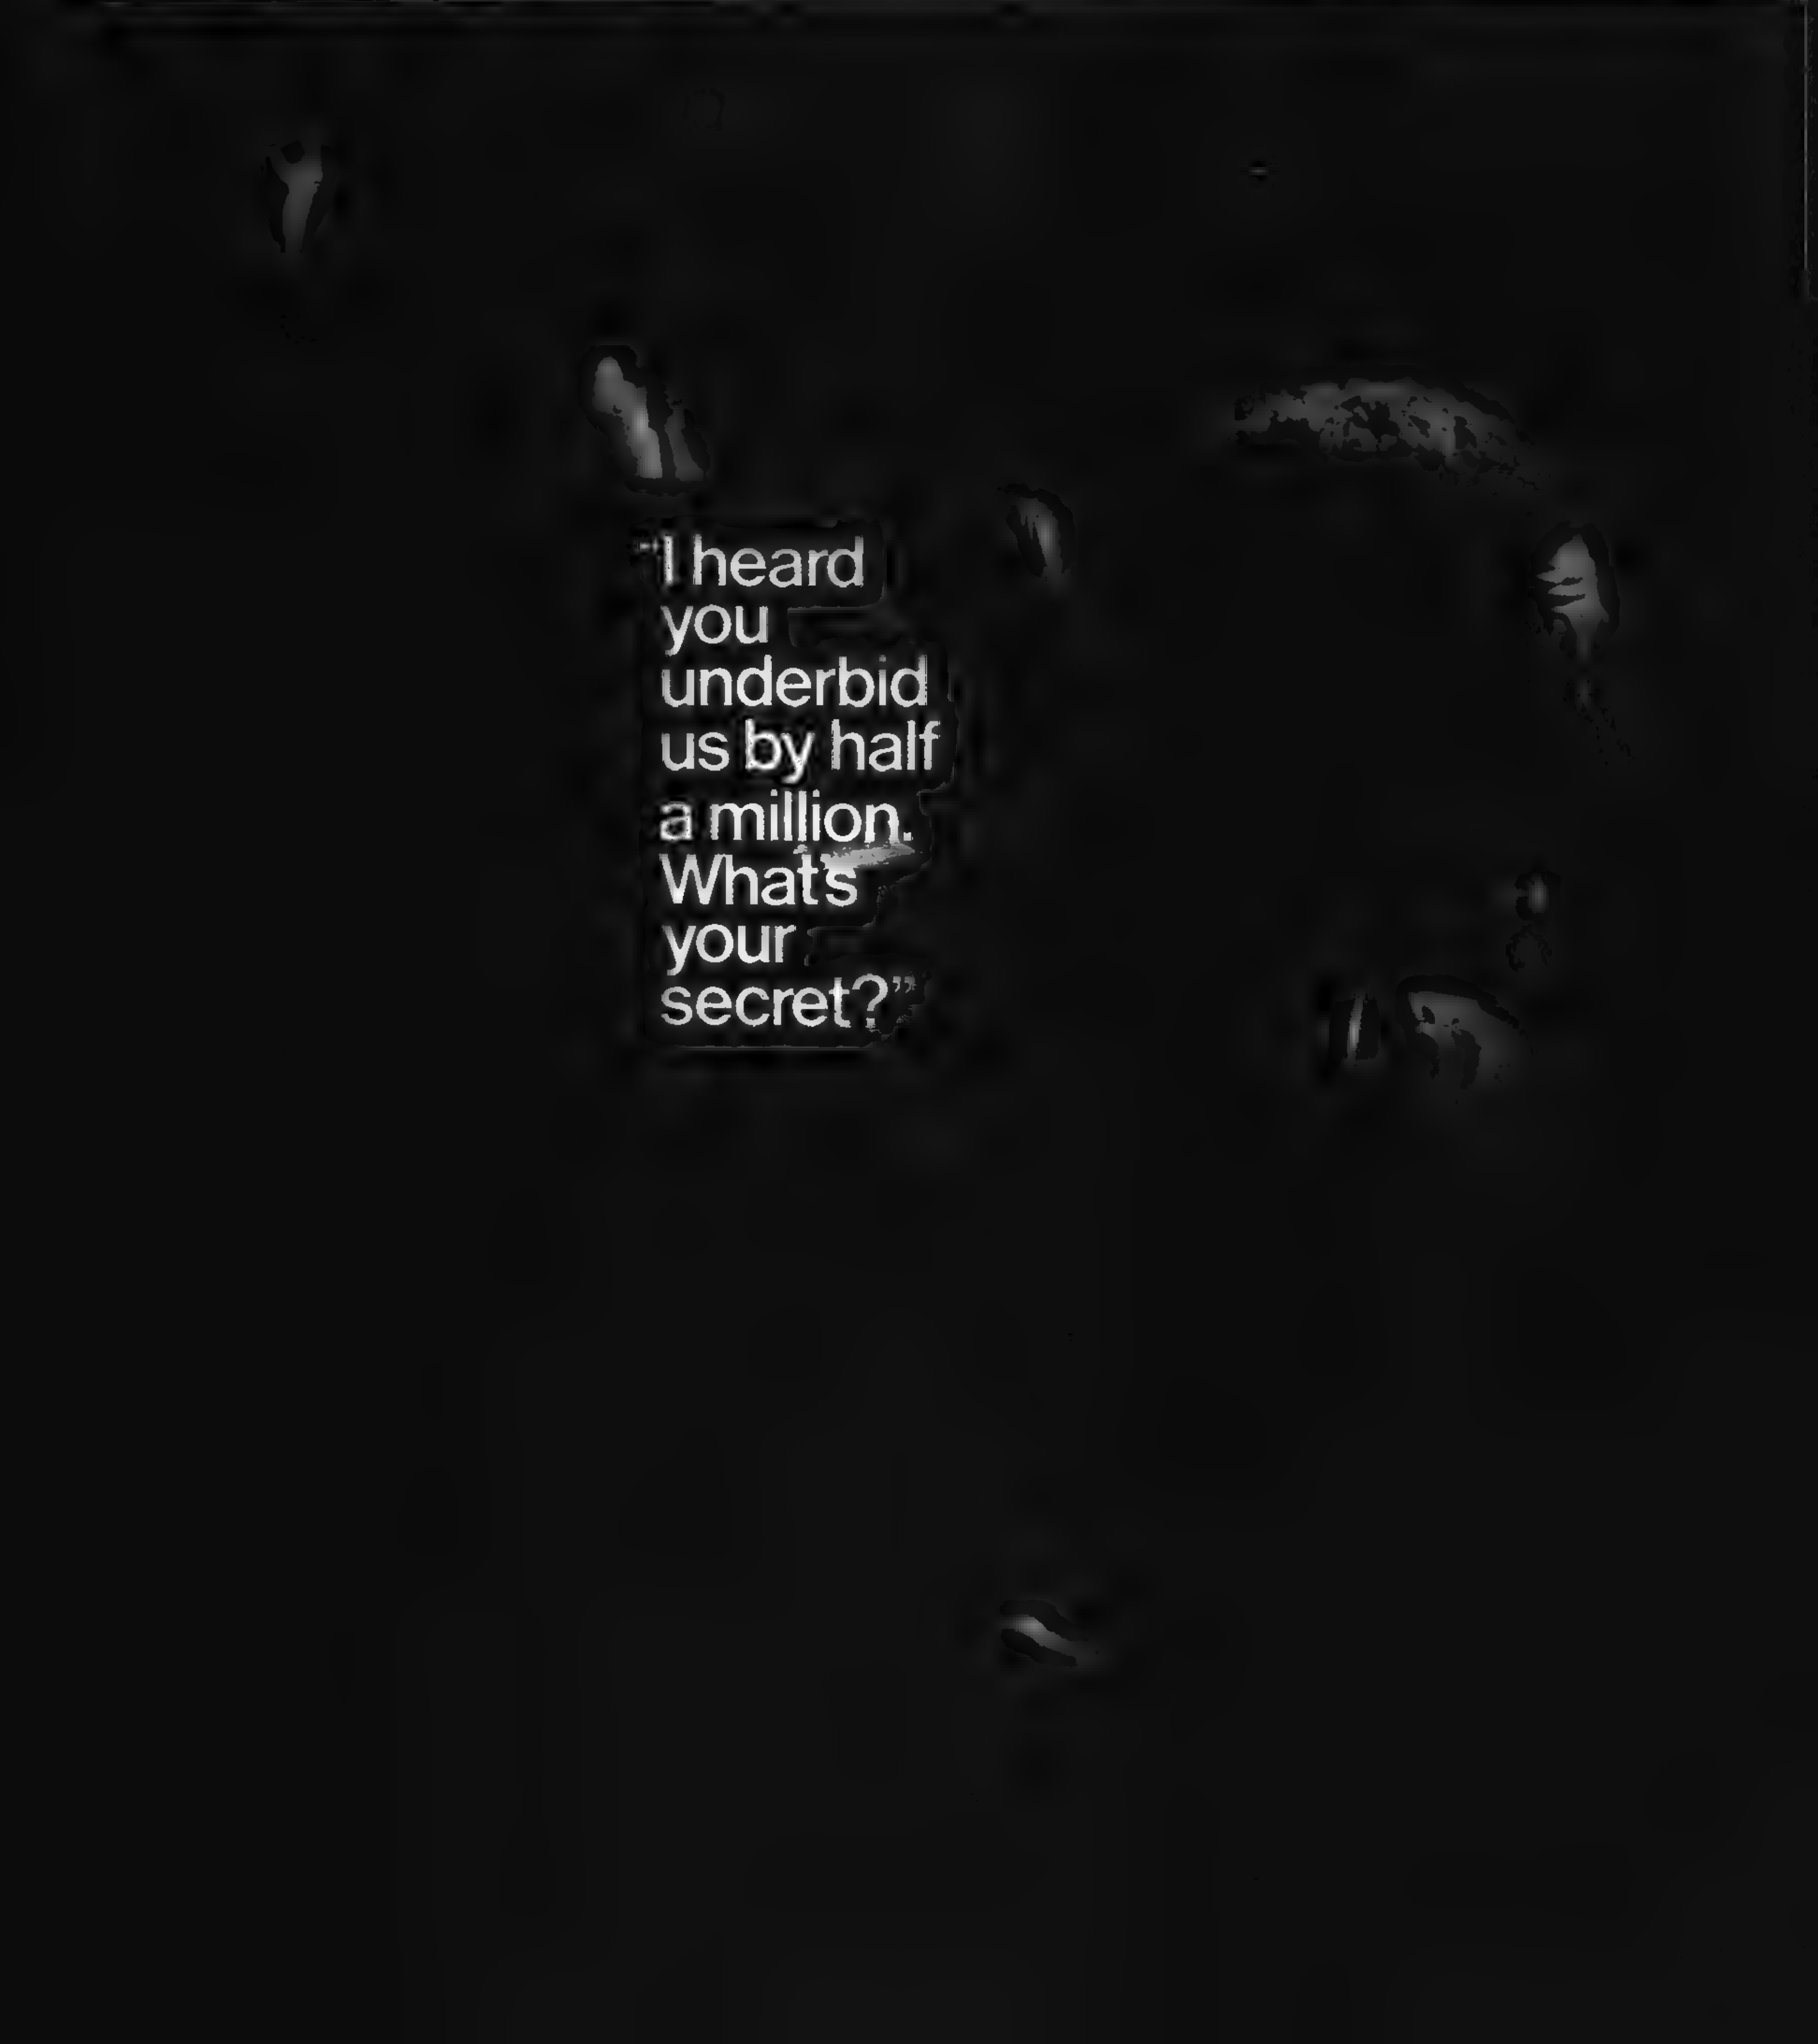
IBM Information Network...The Smart Connection

Matt's office has been winning a lot of new business lately. And it's really not much of a secret.

Because he and his co-workers have been able to make more efficient use of their resources. How? Well, Matt brought in Team Xerox.

Which includes Xerox 8010 Star



"I heard you underbid us by half a million. What's your secret?"

Workstations, high speed laser printers, file servers for organizing and storing data and communications servers for accessing mainframe data bases, all linked together with a Xerox Communications Network. For complex analytical tasks, Xerox also included a Xerox Artificial Intelligence System.

So Matt (and the people in his domestic and international offices) could create, access, share and react to information more quickly and more easily than ever before.

And since Matt's office has become so much more productive, he was able to cut costs—and enter a bid that was $500,000 less than anyone else's.

To make Matt's secret yours, call Team Xerox at 1-800-833-2323, ext. 42 or send your business card to Xerox Corp., Dept. 42013, P.O. Box 24, Rochester, NY 14292.

Finally.

SIA doubts Japanese promises

By Clinton Wilder
CW Staff

SAN JOSE, Calif. — The trade association representing beleaguered U.S. semiconductor vendors has reacted skeptically to plans by the Japanese government and Hitachi Ltd.'s to increase the U.S. share of Japanese markets.

"Hitachi got the train on the right track but didn't move it very far," said Daryl Hatano, manager of governmental affairs for the Semiconductor Industry Association (SIA) based here. With U.S. chip makers' share of the domestic market dwindling, the SIA filed a petition recently with the U.S. Trade Representative seeking more Japanese purchases of American-made chips.

Hitachi announced last month at a Washington, D.C., teleconference that it will increase its purchases of U.S. products by $120 million by the end of 1986. But the SIA claimed that the planned increase represents just 0.5% of Hitachi's projected sales this year and will not significantly alter the current semiconductor trade imbalance.

"If semiconductors represent one-fourth of the U.S. products Hitachi buys this year, we calculate that to be about a $10 million increase in 1985," Hatano said. "Even if the other leading Japanese vendors follow suit for a $50 million increase in U.S. sales, we would still be short of [U.S. sales to Japan in] 1984. That is not the substantial increase in market share that we seek in our petition."

For long-term market share goals to be realized, U.S. chip makers must be treated as primary rather than residual suppliers to Japanese electronics vendors, Hatano said. Without a long-term commitment, U.S. firms will continue to be vulnerable to the boom-and-bust cycles of the volatile semiconductor market, he added.

Dataserv — third-party IBM hardware store

By Peter Bartolik
CW Staff

HOSKINS, Minn. — A used IBM 4331 Model 1 can be picked up for 11% to 15% of the IBM list price these days. But that same computer is worth more than double the list price to a company based here.

Dataserv, Inc. adds value to the 4331 not by bundling in software and peripherals, but by dismantling the CPU and selling components to third-party maintenance organizations.

Primarily involved in leasing, trading and maintaining IBM equipment, the company initially built its parts operation to service its own third-party maintenance efforts but quickly discovered a profit center opportunity. "We started the business to service ourselves," recalled company President Ronald G. Olson. "Then people started calling us and it turned into a real business."

Started in late 1983, the parts sales grew steadily to generate revenue of $2.3 million in 1984 and is expected to generate more than $7 million this year. The company boasts an inventory valued at $20 million in sales but readily admits it costs much less to accumulate the stocks.

"We're the hardware store for the third-party maintenance industry," said Craig Gillaspey, the head of the parts department who maintains an on-line data base of parts in stock and component alternatives that can be switched among different IBM machines. He said the company has even sold off "five-pound boxes of assorted IBM screws, nuts and bolts" for field maintenance engineers, adding that he would be embarrassed to say how profitable that sideline was.

Like many companies involved in the so-called third-party industry dealing in

Computer industry update

INDUSTRY INSIGHT
Peter Bartolik
CW Senior Editor

Unless it can be proven that Japanese semiconductor manufacturers really are engaged in dumping practices, U.S. government involvement in chip trading makes little sense.

If there is one thing we do not need in the computer industry, it is the kind of protection that U.S. car makers received in the past few years. Several studies have pointed out that the result of quotas on Japanese car imports resulted in higher costs all around and little impact on imports.

One striking element of protectionism is that it rewards the lack of ability to compete.

To their credit, most U.S. chip makers have not sought tariffs on imports, rather, they have urged the U.S. government to pressure the Japanese to buy more U.S.-made products.

But the basic creed of the entrepreneurial spirit that supposedly dominates Silicon Valley is that you buy the best product from the most reliable source at the lowest price. If the Japanese truly are able to produce at lower cost, no amount of pressure is going to make U.S. chips a better buy.

As much as cost, the intertwining na-

Acquisition, merger activity on rise

Software, services survey shows 49% increase in 1985

FORT LEE, N.J. — In the software and services industry, today's buzzword is mergers.

A study from Broadview Associates, compiled twice a year here for members of the Association of Data Processing Service Organizations, Inc. (Adapso), reported the software and services industry experienced a 49% increase in merger and acquisition activity during the first half of 1985. The study also revealed a 42% increase over last year in the number of firms considering mergers. The figures do not include General Motors Corp.'s $2.5 billion acquisition of Electronic Data Systems Corp. (EDS) last year.

There were 82 merger deals consummated during the first half of the year, compared with 55 during the first half of 1984, according to the "Broadview Index," which attributed the rise to the unavailability of funding from venture capitalists and the public market. Of those 82 acquisitions, 63% occurred in software products firms, the study said.

Merger considerations totaled $846.4 million during the first half of 1985, compared with $597.5 million through June of last year, the index said. Among the more notable acquisitions during the first six months of the year is Sterling Software, Inc.'s offer to acquire Informatics General Corp. of Woodland Hills, Calif.

Not only are there more mergers, but this year's mergers are more expensive, the index noted. "Excluding last year's General Motors-EDS deal, the 10 top deals in the first half of 1985 had a greater value than all deals in the first half of last year," said George Grodahl, a partner with Broadview Associates. According to the "Broadview Index," firms looking for acquisitions are seeking older, more mature companies and not burgeoning start-ups.

About 62% of the merger deals consummated during the first half of the year were made by companies seeking an expanded role within the software industry, while 28% came from major corporations seeking to expand their position within the software and services industry.

Broadview Associates is located at 2115 Linwood Ave., Fort Lee, N.J., 07024.

Bankruptcy court approves Ztel plan

WILMINGTON, Mass. — Ztel, Inc. recently announced it had received approval of its reorganization plan from the U.S. Bankruptcy Court and emerged from U.S. Federal Bankruptcy Act Chapter 11 proceedings only 79 days after filing for protection.

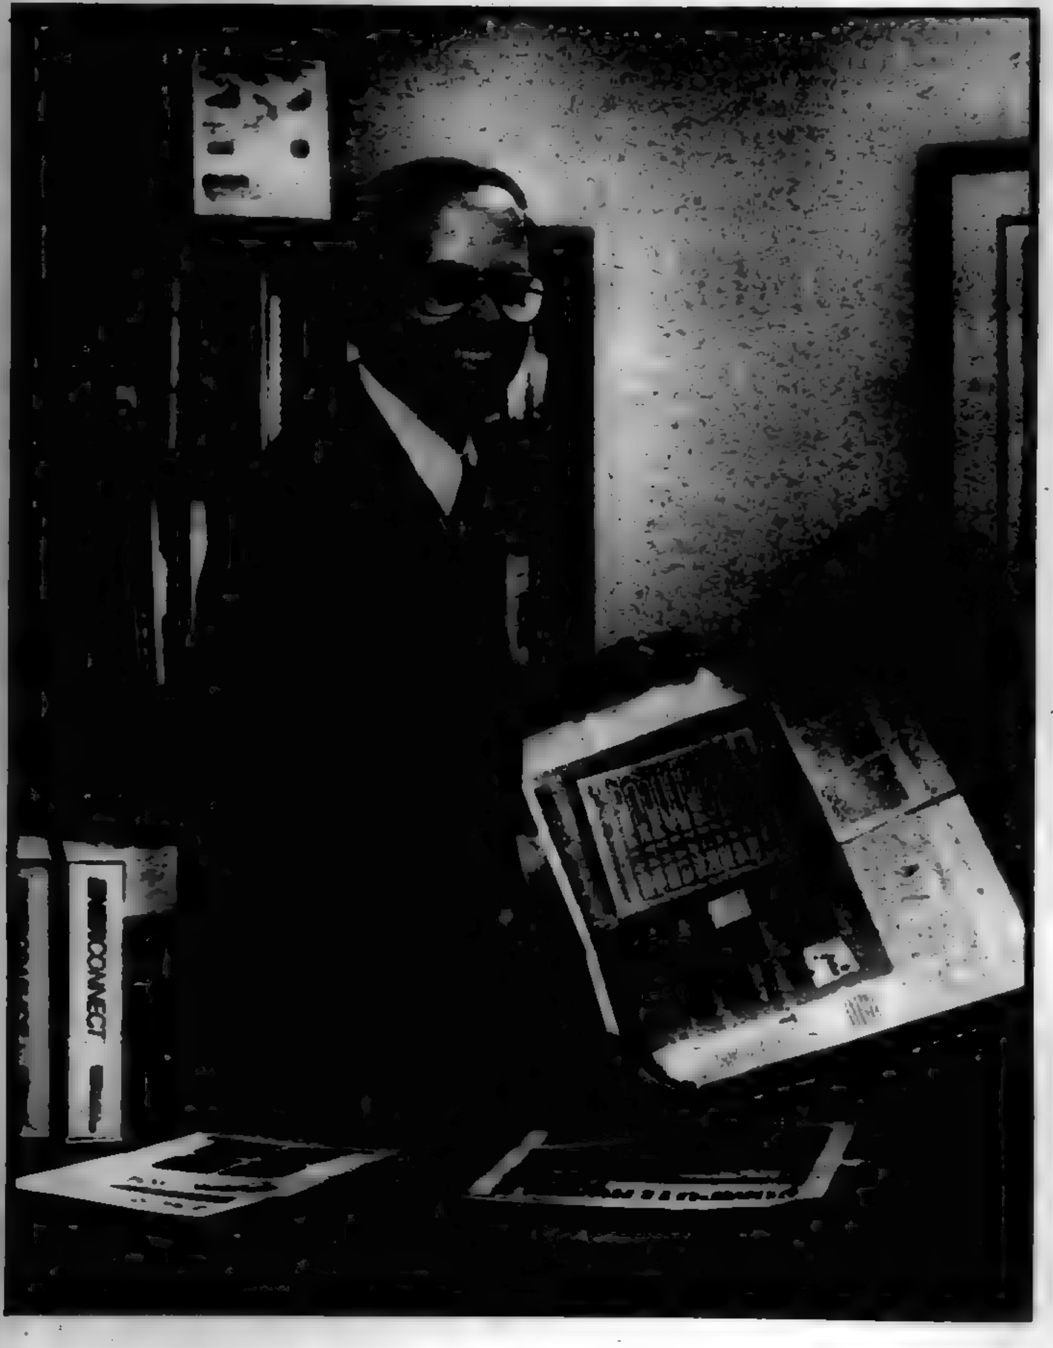
The company said the plan calls for 100% repayment of creditors.

Ztel will receive $17 million in capital in exchange for new Class A preferred stock issued to investors General Electric Venture Capital Fund, NCR Corp., Hillman Co. and subsidiaries and Harvest Ventures.

Murray H. Bolt, president and chief executive officer, said that the firm is now in a position "to pursue [actively] new distributor agreements and additional end-user installations and to step up our manufacturing and marketing operations to meet those demands."

The company, based here, is a manufacturer of an integrated voice/data private branch exchange system.

“Two ads in Computerworld Focus flooded us with inquiries on our new micro product, EnerConnect.”



EnerConnect is the second major micro product from Enertronics, developers of the successful EnerGraphics package. As the ad for EnerConnect says, it is “. . . the first software package that puts mainframe graphics capability into the hands of anyone with an IBM PC . . . or 3270 PC.”

When it came time to announce EnerConnect, Randy Andes decided to use *Information Week*, *Business Week*, and *Computerworld Focus*. As Randy puts it, “. . . we knew *Computerworld* reached the people we need to talk to from past ads for EnerGraphics, and we decided to test *Focus* because, as the name says, each issue focuses on a topic. So, we could select an appropriate editorial environment.”

The results? “*Computerworld Focus* has produced the most response of any of the publications used and, by far, the best response. In fact, total response (via the 800 number) has far exceeded expectations. We further intend to continue to tie into *Computerworld's* editorial calendar where appropriate.”

The moral? Well focused advertising in a well focused medium will produce the best results every time.

Call your *Computerworld* advertising representative for more details on upcoming issues of *Computerworld Focus*.

Randy T. Andes, Director of Marketing,
Enertronics Research, Inc., St. Louis, Missouri.

Compaq bucks trend, posts second-quarter gains

Cites unsaturated business market

By Eric Bender
CW Staff

NEW YORK — Claiming that the business micro market keeps growing despite the overall industry slump, Compaq Computer Corp. recently posted second-quarter sales of $118.9 million, showing a 22.5% increase over first-quarter results and an 80% boost over second-quarter 1984 revenue.

Net income for the quarter just ended reached $5.7 million, a 536% gain over $892,000 in the corresponding quarter last year.

"We're in the strongest position we've ever been in," President Rod Canion told securities analysts here.

> ”
>
> *'We still have 70% to 80% of the market ahead of us.'*
>
> — Michael Swavely
> Compaq Computer Corp.

Despite industry reports of slowing sales, "the business personal computer market is clearly not saturated at this point," Marketing Vice-President Michael Swavely said. Estimating that between 10 million and 12 million micros have been placed among the more than 53 million U.S. white-collar workers, Swavely maintained that "we still have 70% to 80% of the market ahead of us."

Canion said he expects Compaq to maintain current pricing on its systems, noting that the Houston firm traditionally has pegged its prices to IBM's and predicting that IBM will not announce major price reductions this year. "They learned a good lesson last year," he said. "They cut prices 20%, and unit sales didn't go up. That kind of performance doesn't go unnoticed in Armonk [N.Y.]."

Demand among large corporations continues to be strong, Swavely said, citing a recent survey of the Westchester County Corporate Micro Users Group, which found member companies planning to purchase 39% more microcomputers during the next 12 months than the total number in their installed bases.

"We're still seeing a number of companies that have only just made a commitment to personal computers," Swavely said. The share of Compaq products going into Fortune 1,000 firms has increased in the past year, he added.

The Houston manufacturer also has found that "the majority of today's personal computer buyers are repeat buyers," Swavely said. Studies showed that 57% of the company's customers were repeat buyers in April, up from 37% last September.

"This plays to Compaq's strength," as experienced users look for added functionality, Swavely said. These users pass their micros along to first-time users, and "the importance of [IBM] compatibility is magnified by the trickle-down effect," he said.

More than 10,000 of Compaq's new Intel Corp. 80286-based systems shipped in the two months following their April introduction, Canion said, adding that he expects production to catch up with demand in the third quarter.

Compaq has shipped more than 300,000 personal computers, which represents almost one-tenth of IBM's estimated deliveries, Canion said. He presented estimates of overall U.S. retail sales of business micros that showed IBM with a 63% share, Compaq with 16%, Apple Computer, Inc. with 12% and AT&T with 4%. Other contenders "have just about gone away," he said.

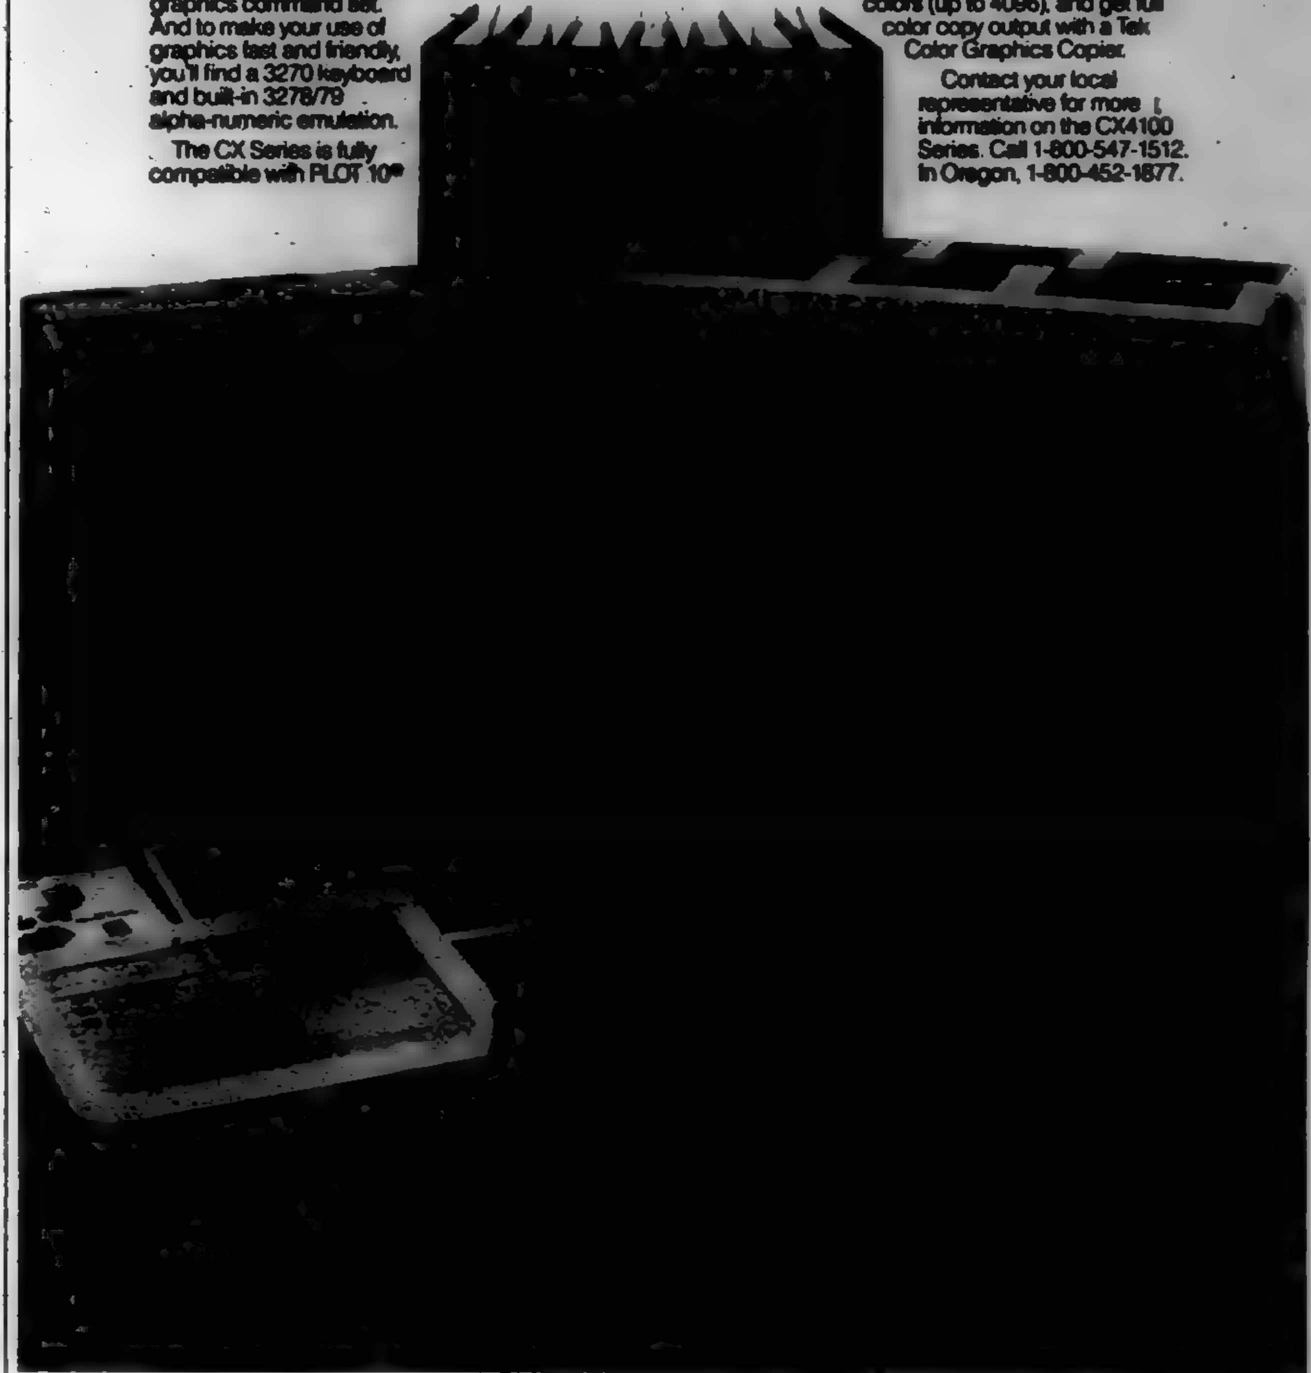
He also noted that the firm's Compaq Telecommunications Corp. subsidiary began volume shipments of its Telecompaq voice/data workstation to OEM customers in July and said that the firm is "very close to additional major deals."

POWER TOOLS FOR THE 3270 ENVIRONMENT.

Tek's CX4100 Series: High-performance color graphics terminals that fit into your IBM host environment. With the CX4100 Series, you gain the rich, efficient Tektronix graphics command set. And to make your use of graphics fast and friendly, you'll find a 3270 keyboard and built-in 3278/79 alpha-numeric emulation.

The CX Series is fully compatible with PLOT 10® IGL, GKS and TCS as well as popular third-party software packages. New PLOT 10 GDI software provides an interface to GDDM applications. Other features include a 60 Hz non-interlaced display that provides optimum clarity and fatigue-free viewing. One megabyte of segment memory is available. Plus you can display graphics in 16 simultaneous colors (up to 4096), and get full color copy output with a Tek Color Graphics Copier.

Contact your local representative for more information on the CX4100 Series. Call 1-800-547-1512. In Oregon, 1-800-452-1877.



LOSE FAT.

THE LEADER IN ON-LINE TRANSACTION PROCESSING INTRODUCES THE FIRST NONFAT DISC.

It's the first disc drive product specially designed for high-volume transaction processing. It's designed for fast response time, too, with eight simultaneous accesses in one cabinet. And it conserves your most expensive real estate—the computer room.

SMALL FOOTPRINT. BIG SAVINGS.

In one of our typical database applications, five Tandem V8s provide 700 accesses per second in only 50 sq. ft. of computer room space. For the same job, the competition would have required 250 sq. ft., five times as much, plus an extra $146,000 in hardware.

The reason for the difference—disc fat.

To handle high volume, a database must be split up over several discs for simultaneous access. So with large, conventional disc drives, only a small portion of each disc gets used.

Not with the Tandem V8. We put data on small high density discs. The entire disc gets used. So, no disc fat.

EASY TO SERVICE.

With the Tandem V8, maintenance is easy too. Each disc drive can be removed and replaced in a few minutes. And the entire unit can stay on line even while it's being serviced.

THE NEW TANDEM V8.
For fast response time and high-volume transaction processing.

GROW MUSCLE.

THE LEADER IN ON-LINE TRANSACTION PROCESSING BEEFS UP YOUR BRANCH OFFICE.

Tandem extends its fault-tolerant line with a new low-cost system that's totally compatible with the more powerful NonStop TXP™ and the NonStop II.™ Its price and size let you put power where you need it—even a branch office or department copy room.

The NonStop EXT™ comes with enough muscle to support up to 100 terminals. So it takes the work load off the main host and serves as your local host. It also shares information in your corporate network.

The EXT is self-contained in one cabinet. Just wheel it in and plug it in. No additional air conditioning is needed.

It comes with enough expansion slots to double its processing power and quadruple its memory. You can also link two EXTs together if you need them. You can even team it up with the nonfat Tandem V8.

LET'S CHEW THE FAT.

Tandem systems are already at work for FORTUNE 500 companies in banking, telecommunications, manufacturing, transportation, retailing and energy, as well as several branches of the United States Government.

To find out what we can do for you, call (800) 482-6336. Or write for our annual report. Corporate Headquarters: 19191 Vallco Parkway, Dept. 762, Cupertino, California 95014.

ONCE BELKNAP CHOSE AT&T, OUR HARDWARE COULD START MOVING THEIRS.

For nearly 150 years, Belknap has supplied quality hardware to retailers in twenty-five states. Now they've set their sights on the other twenty-five, and once again they're relying on quality hardware to help them get there—the kind supplied by AT&T.

The New Belknap has developed a totally automated end-to-end distribution system—the only one of its kind. The nuts and bolts of the system are the AT&T UNIX™ PC and 3B family of computers, a hand-held data terminal called the PDE 400, and our Enhanced Network Services to keep information flowing between retail stores and distribution centers.

Belknap will be able to serve their customers as never before. Inventories can be monitored from moment to moment, and orders placed electronically to keep retailers in stock. Sophisticated financial reports will give them up-to-the-minute accounts of their profit margins, cost of goods sold, and other critical information to help them better manage their business.

Only AT&T could provide the complete system to launch the New Belknap on a national scale. Because all our products can grow and expand right along with them, they're ready now to meet future needs and demands that may arise.

Add to that AT&T's unparalleled national sales and service network, and it's clear that when the New Belknap chose AT&T, they hit the nail right on the head.

To find out why AT&T is the right choice to help your business meet its long-term needs and goals, call your Information Systems Account Executive or 1 800 247-1212, Ext. 538.

AT&T

The right choice.

Vendor restrictions should not stifle user's creativity

OUTSIDE LINES

L. J. Kutten

Do developers of computer programs have any claim to works created with the help of their programs?

Until recently I assumed without thinking the answer to such a question was no. But then I received the Videoworks software program from Hayden Software Co.

Videoworks is an animation package for the Apple Computer, Inc. Macintosh. It allows the user to produce professional-quality animation that can be used to create cartoons, business presentations and the like. It is an excellent program that does what it is advertised to do. However, product literature says the program cannot be used in a commercial setting. Right below the copyright notice is the following statement:

"Warning: This reservation covers art shown by this software as well as the software itself. Purchasers of copies of this software may view and reproduce such art for noncommercial enjoyment purposes only."

A Hayden representative initially maintained that this statement meant exactly what it said: any commercial use, including in-house commercial use, was prohibited. If commercial use was intended, an additional license would have to be obtained from Hayden.

After I had several discussions with both Hayden and the author of the program, Hayden reversed itself and announced that commercial use was not prohibited.

But the incident started me thinking about the nature of a work "co-authored" by a computer program.

Why couldn't this reservation be legal? From Hayden's viewpoint, one could argue that actually displaying a finished product with Videoworks is only possible because of the creative contribution of Videoworks' creators. Without it, no one could create this type of animation. The problem with accepting this argument is that it can equally apply to data base, word processing, spreadsheet and other programs.

After some serious reflection, I realized why Hayden's analysis was wrong. Copyrighted software has one fundamental difference from all other types of copyrighted material; it is nothing more than a tool to accomplish an end.

No tool manufacturer would claim that the tool created the work. A tool is just an instrument to create something.

A typewriter or Micropro International Corp.'s Wordstar does not write a book, a person does; a paint manufacturer does not create a painting, a person does. Likewise, Videoworks does not create the animation, a user does. In this sense Videoworks is no different than any other tool used by people to express their creativity.

Society benefits from encouraging creativity; new products are constantly being developed. Limiting the ways people can use a particular tool limits their creativity. And even Hayden itself must acknowledge that without creativity Videoworks itself would never have been created.

Kutten is a writer specializing in computer law topics. He is a member of the bar in Illinois and Missouri and the author of Computer Buyer's Protection Guide, *published last year by Prentice-Hall, Inc.*

Profits rise at Comdisco

ROSEMONT, Ill. — Comdisco, Inc., the largest publicly held computer dealer and lessor, recently announced third-quarter profits of $18 million, or 67 cents per share, including approximately $7.7 million in revised estimated tax benefits.

The profit compared with year-earlier profit of $6.99 million, or 25 cents per share.

The company said that during the quarter just ended, it filed for a refund of $14.6 million in federal income taxes paid in prior years due to a carryback of investment tax credits. The refund will be received during the fourth quarter and added to investment tax credits recognized in estimating the tax rate for the current year. This resulted in reducing the previously reported six-month tax rate of 19% to 1% for the entire year.

Pretax profits in the quarter amounted to $12.6 million, compared with $8.8 million a year earlier.

Revenue for the quarter was $149.3 million, up from $133.1 million a year earlier.

Kenneth N. Pontikes, chairman and president of Comdisco, said that IBM's recently announced products and expedited delivery schedules for the 3090 mainframe "will stimulate market activity for both new and used equipment, further enhancing our earnings opportunities." He said the company's diversified subsidiaries continued to contribute steadily to overall results.

ANNOUNCING THE 2.7 MIPS, 68020-BASED UNIVERSE 32.

BUY BEFORE OCT. 31, GET A 140 MB DISK FREE!

In 1982, we leapfrogged the 16-bit minicomputers when we introduced the first 68000-based supermicro with a true 32-bit architecture. Now, in 1985, that means we can take full advantage of the remarkable performance of the Motorola 68020 microprocessor simply by plugging it into a 32-bit architecture that's already proven in 2,000 Universe installations.

The result is the new Universe 32: a 2.7 MIPS powerhouse that we can deliver now.

To make sure we deliver more 68020-based systems in 1985 than any other company, and to plant the seeds for long-term relationships, we're making an exceptional offer.

You pay for the basic Universe 32 Model UV32/35T (1 Mb RAM, 35 Mb disk, 45 Mb streaming tape, four serial ports; price $24,900).

You get the Universe 32 with a FREE upgrade to 140 Mb (114 Mb formatted) disk; FREE upgrade to 4 Mb RAM; FREE upgrade to 12 serial ports; and FREE UNI/System V Operating System (derived from UNIX System V under license from AT&T). Orders must be placed by October 31, 1985, for delivery by December 31, 1985. After October 31, this same system will cost you $43,700. No quantity limit. No additional discounts apply. Offer available only in the United States.

For full details call (617) 626-1000 or write Charles River Data Systems, 983 Concord Street, Framingham, MA 01701, Telex 681-7373 CRDS UW.

Zaisan files Chapter 11 plea

HOUSTON — Zaisan, Inc. a manufacturer of integrated voice/data workstations, recently announced it has filed for reorganization protection under Chapter 11 of the U.S. Federal Bankruptcy Act.

The company said it will continue operations and named Donald F. Bynum as president and chief executive officer. Bynum previously guided Dallas-based Micro Craft Corp. through Chapter 11 proceedings. Mark Fowler, former Zaisan president, resigned in the spring.

In its Chapter 11 petition, the firm cited high start-up costs and costs attributed to an earlier attempt to sell its products through retail distribution channels. The company manufactures the ES.1 voice/data terminal and ES.3 IBM Personal Computer-compatible workstation.

The company had been reevaluating its situation since January, when it brought in a team of consultants to examine operations, according to spokeswoman Wendy Roloff. In April, the company reduced employment to fewer than 35 people, down from a high of 180 last summer.

Digital Research inks buy-in pact

MONTEREY, Calif. — Digital Research, Inc. recently announced that both Northern Telecom, Inc. and Motorola, Inc. signed agreements to purchase minority equity interests in the microcomputer software firm.

Gary Kidall, founder and chairman of the board at Digital Research, said "This vote of confidence from these two companies provides strong capital support to continue the development and launch of our very well-received [Graphics Environment Manager] product line and the family of Concurrent DOS operating systems."

Digital Research said the investments are not a step toward acquisition and that both firms are limited to holding minority shares in the company.

The agreement reportedly provides Northern Telecom with 15% of Digital Research shares and Motorola with 7.5%, for an estimated total cash infusion of $9 million.

Privately held Digital Research has reportedly been under financial pressure in recent months as it sought to formalize product strategies to duplicate its earlier success with CP/M.

Apollo institutes cost-cutting acts

CHELMSFORD, Mass. — Anticipating a third-quarter decrease in revenue, Apollo Computer, Inc. recently announced it has implemented cost-reduction measures, including a mandatory six-day leave for most employees.

The company said that employees will not be paid for the leaves, which are to be taken during this quarter. Salesmen will not be affected by the mandatory leave but will receive a 7.5% reduction in base pay, the company said.

Additionally, the company's component manufacturing operations will be moved to a new facility in New Hampshire, and all affected employees will be offered positions there in New Hampshire, the company said.

"We currently face the probability of a sequential quarterly decrease in revenue in the third quarter, due to a depressed order rate, seasonal factors in international markets and product transitions," said Thomas A. Vanderslice, Apollo's president and chief executive officer. However, he added that the company is well positioned to benefit from a recovery in sales.

Revenue rises at Informatics

WOODLAND HILLS, Calif. — Informatics General Corp., manufacturer of the Answer/DB data base management system, reported a 25% increase in revenue for the second quarter ended June 30 compared with the same quarter a year ago.

Informatics said second-quarter revenue was $55.4 million compared with $44.5 million the previous year.

Although it realized a jump in sales, Informatics reported a net decline of $579,000 in profits compared with a gain of $611,000 during the second quarter of 1984. The company attributed the loss to $2 million in expenses incurred during its proxy contest earlier this year with Sterling Software, Inc. of Dallas.

Paradyne takes quarterly loss

LARGO, Fla. — Paradyne Corp. reported a loss of $9.2 million, or 41 cents per share, for the second quarter ended June 30, compared with a profit of $2.4 million, or 11 cents per share, during the like 1984 quarter.

Revenue at the data communications equipment company was $66 million for the second quarter compared with $70.5 million during the second quarter of 1984.

For the six months ended June 30, Paradyne reported a net loss of $9.04 million compared with a net profit of $5.3 million for the same six-month period a year ago.

The loss included a $10 million pretax provision for slow-moving and obsolete inventory and off-lease equipment, a spokesman said. Paradyne President Robert Wiggins attributed the profit loss to an industrywide sales slowdown, losses in its UK subsidiary and an $800,000 pretax expense related to the company's new circuit board facility.

Lotus adds three divisions in company reorganization

CAMBRIDGE, Mass. — Lotus Development Corp. recently created three additional divisions to reorganize the company around a total of five divisions.

Previously, Lotus had operated the Engineering and Scientific Products Division and the Publishing Division.

The Business Products Division was created to market the company's existing software products and develop and market new products targeted at general business managers. Charles Digate, former vice-president of marketing, was named vice-president and general manager of the division.

Irfan Salim, former director of international operations, was named vice-president of the International Division to direct worldwide operations.

The Information Services Division was formed to manage and expand products produced by Dataspeed, Inc., of San Mateo, Calif. Shareholders of Dataspeed, which manufactures two products that receive real-time stock quotations, recently approved the $6.5 million sale of the company to Lotus.

Multinational forum eyes office systems technologies

Managers to exchange corporate information

By Peter Bartolik
CW Staff

BOSTON — Managing the implementation of advanced technologies in the office may soon take on a multinational flavor with top executives on both sides of the Atlantic exchanging information on the changing corporate environment.

The Office Technology Research Group, based in Los Angeles, recently announced it had established European offices in London and Brussels. Office Technology Research Europe will emulate the 8-year-old U.S. group's history of bringing together senior executives from major corporations to address management issues arising from the introduction of advanced technologies in the office.

John J. Connell, executive director of the U.S. group, said in a recent interview here that the European venture will provide a forum for European executives to learn from each other, provide them with implementation strategies adopted in the U.S. and give U.S. and Canadian executives some insight into what is going on in Europe.

"There will be information flowing both ways," Connell said. North American executives may gain valuable insight in "those areas where the Europeans have perhaps more progressive ideas than we have — ergonomics for example," He noted that "a concern for the impact of technology on people is much stronger in Europe than it is here."

Connell started the group in 1977, and it has met semiannually "as a forum where managers from large companies can share with each other what they are doing in the world of advanced office systems and what they are learning from it." The group also distributes newsletters and updates of its 10-volume "Office of the Future" library to members.

Connell's group focuses on the impact technologies have on management processes, organizational relationships and other factors involved in determining how a business should be run. One area of continuing concern "is how do you measure the gain that you may receive from these systems," he said. "How do you estimate it, and then after you put the system in, how do you measure it? If you want to call it productivity, how do you measure productivity?"

North American subscribers to the group number approximately 44 from among the Fortune 200, including Hughes Aircraft Co., Security Pacific National Bank, Atlantic Richfield Co., Northern Telecom, Inc. and General Dynamics Corp.

"The member companies are of a size where they are willing to experiment a bit with very advanced technology," he said. In addition to swapping case histories, the members have formed a networking resource, and Connell said he hopes to extend that network across the Atlantic.

Prior to forming the group, Connell was deeply involved in technological implementation as vice-president of administrative services with Atlantic Richfield where he functioned as the top MIS person. "But I was also responsible for telecommunications and all the office administration," he said.

"When the drive to move machines into the office really took off, in the mid-70s, I was responsible for that at [Atlantic Richfield], and it became apparent to me there were a . . . lot more answers than questions." That led him to create a forum for executives to discuss how to manage the vast technology resources being tossed on the market.

NICKELS AND DIMES

Tektronix, Inc. reported revenue of $86.3 million and a net loss of $19.4 million, or 93 cents per share, for the fiscal quarter ended June 29.

This compared with revenue of $121.5 million and profits of $8.8 million, or 42 cents per share, for the same period a year ago.

■

Lee Data Corp. announced revenue for its first quarter ended June 30 of $21.8 million, compared with $23.9 million in the same quarter last year. Profits were $866,000, or 6 cents per share, compared with $2 million, or 15 cents per share, in the same period one year earlier.

■

Software AG recently announced revenue for its fiscal year ended May 31 of $52.3 million, compared with $39.6 million in the prior year. Profits were $6.7 million, or $1.12 per share, compared with $5.1 million, or 83 cents per share, in the comparable period last year.

For the fourth quarter, revenue was $14.1 million, or 17 cents per share, compared with $10.5 million, or 17 cents per share, for the same period of the prior year.

■

Computer Task Group, Inc. reported revenue for the second quarter ended June 30 of $28.2 million, an increase of 51% over $18.6 million reported in the same quarter one year ago. Profits were $893,000, or 26 cents per share, compared with $511,000, or 17 cents per share, in the comparable period one year earlier.

The company's revenue and earnings per share for the 12 months ended June 30 were $101 million and 90 cents, respectively.

■

Compugraphic Corp. reported revenue of $105.1 million for the quarter ended June 29, compared with $94.8 million for the second quarter last year. Profits were $8.3 million, or $1.01 per share, compared with $6 million, or 72 cents per share, in the same quarter last year.

During the quarter, Compugraphic sold its French and West German subsidiaries, resulting in a gain on the sale and the recognition of income related to previously eliminated intercompany profit in inventory. The effect of these transactions was net income of $1.9 million, or 23 cents per share, which is included in the reported figures.

■

Teradyne, Inc. reported revenue for the quarter ended June 29 of $85.9 million, compared with $93.6 million in the year-earlier quarter. Profits were $3.8 million, or 16 cents per share, compared with $10.6 million, or 46 cents per share, in the comparable quarter one year earlier.

■

Quantum Corp. announced revenue for the first quarter of fiscal 1986, ended June 30, of $34 million, compared with $25.3 million in last year's quarter. Profits were $5.7 million, or 60 cents per share, compared with $4.2 million, or 45 cents per share, in the same period last year.

■

VM Software, Inc. reported revenue for the second quarter of $4.2 million, compared with $2.7 million in the same quarter last year. Profits were $590,543, or 16 cents per share, compared with $527,113, or 15 cents per share, for the second quarter last year.

■

Lexidata Corp. reported revenue of $6.3 million, with a net loss of $1.2 million, or 17 cents per share, for the 13-week period ended June 29.

These results compare with revenue of $9.4 million, and a net loss of $300,000, or 5 cents per share, for the comparable period in the last fiscal year.

SUPERSHORTS

Atex, Inc., a subsidiary of Eastman Kodak Co., recently announced it has reduced its U.S.-based work force by 260 people. The company said it eliminated redundant positions and consolidated administrative operations.

Atex said there is continued strong demand for its computer-based publishing systems.

■

Fujitsu America, Inc., a telecommunications, computer and office automation products firm, officially broke ground in Hillsboro, Ore., for a $30 million, 144,000-sq-ft plant.

The Fujitsu facility, located 20 miles west of Portland, Ore., will open in the spring of 1986. It will reportedly manufacture computer disk drives and related disk products, eventually employing more than 400 workers.

■

U.S. Bankruptcy Court Judge Lawrence Dilason signed an order dismissing the Federal Bancruptcy Act Chapter 11 case of **Digidyne Corp.** of San Diego, based on the company's commitment to pay all undisputed trade claims in full.

■

The **Data Systems Group of Texas Instruments, Inc.** announced it has signed a three-year, multimillion-dollar contract to deliver systems, including hardware and software, to **Sperry Corp.**

■

A consolidation of **ITT Industrial Credit Co.** into the operations of ITT **Commercial Finance Corp.** has been announced by Melvin Brown, president and chief executive officer of ITT Commercial Finance.

Computervision posts second-quarter loss

BEDFORD, Mass. — Computervision Corp., which dismissed 950 workers in April, recently announced its second consecutive losing quarter.

The company said it posted a loss of $19.6 million, or 68 cents per share, for the quarter ended June 30. In the year-earlier quarter, when the company was growing at a 40% rate, profits were $11 million, or 38 cents per share.

The second-quarter loss was slightly more than the first-quarter loss of $18.7 million.

Revenue in the quarter just ended was $112.2 million, down from $133.6 million a year earlier.

James R. Berrett, Computervision's president and chief executive officer, said the second-quarter loss included $5.7 million related to streamlining expenses. Included in those costs, he said, were provisions for disposal of surplus facilities, severance costs and other adjustments.

Xerox reports profits, revenue up for quarter

STAMFORD, Conn. — Xerox Corp. recently announced that continuing operations of its Reprographics and Informations Systems business generated second-quarter revenue of $2.14 billion, up 3% from $2.07 billion a year earlier.

Profits from that group were $102 million, up 9% from $94 million a year earlier, the company said.

Overall, including Xerox's financial services operations, the company posted profits from continuing operations of $118 million, or $1.11 per share, up 35% from year-earlier profits of $88 million, or 79 cents per share.

Including discontinued operations, Xerox reported profits of $221 million, or $2.17 per share, compared with year-earlier profits of $96 million, or 87 cents per share. In the fourth quarter of the previous fiscal year, the company discontinued operations of its Shugart subsidiary and is currently selling off several publishing units.

JAPAN

from page [illegible]

"The Japanese didn't cause the current industry downturn, but they have intensified it," Hatano said. "When there's a drop in the market, being a residual supplier amplifies the down cycle, because purchases from the residuals are cut back more than those from the main [Japanese] suppliers. We want to be treated equally."

Echoing the generally cool response from the U.S. Congress and the Reagan administration, Hatano said the three-year, market-opening plan the Japanese government unveiled would have little effect on the U.S. semiconductor industry woes. Practices such as easing Japanese standardization requirements would have no impact on the key issue — the buying patterns of Japan's largest electronics firms, Hatano contended.

"The government plan doesn't hit at all what we're dealing with," he said.

Last week, the International Trade Commission (ITC) ruled favorably on a petition filed by Micron Technology, Inc. of Boise, Idaho, alleging dumping of 64K-byte memory chips. The ITC ruling, a preliminary finding that dumping is hurting domestic manufacturers, will result in a formal investigation by the U.S. Department of Commerce.

CHIP

from page [illegible]

ture of the Japanese business community is said to result in Japanese businessmen buying from Japanese businessmen. There is little anyone can do to halt such a practice. But there is also nothing to prevent U.S. businessmen taking the same approach and buying domestic products — except the creed for getting the best deal.

■

Ah, if only I had a big brother like the one Electronic Data Systems Corp. (EDS) has.

EDS was acquired last year by General Motors Corp. In a recent financial report, EDS said profits for the second quarter jumped 126% to $42.4 million. Revenue jumped 236% from $224.4 million a year ago to $755.2 million.

Although revenue from outside customers increased respectably, it was the $514.1 million that GM and subsidiaries payed into EDS that made the big difference.

■

The "Bring Back PCjr" campaign [CW, July 22] aimed at IBM has gone national, with chapters now in Framingham, Mass., and Provo, Utah. Can an Armonk, N.Y., chapter be far behind?

With the ground swell growing, it remains to be seen how long IBM can ignore users who want the processor pachyderm to live up to its marketing promises for future PCjr add-ons.

Although the opening of the western chapter marks a significant victory, the timing coincided with a stinging defeat. *Computerworld*'s media cousin, *PC World*, after running "The PCjr Survival Kit" in its July "PCjr World" insert, apparently has given up hope. With nary a word to the faithful, the West Coast magazine dropped the PCjr insert from its August edition. The ghost of microprocessors past shall surely start visiting Publisher David Bunnell.

TIME
is Money in Data Communications

☐ solve user RESPONSE TIME complaints
☐ analyze SYSTEM PERFORMANCE
☐ BALANCE DATA LINES in a user friendly environment

QUESTRONICS CPA/7 provides over 75 categories of line utilization and response time information in 11 different reports (hard copy and/or data based) in such areas as:

- User/System Response Time
- Line Utilization
- Character Transmission Counts
- Transmission Errors
- Host Resident Time
- Network Transmission Time
- Polling Counts
- Poll List Wrap Time
- Histograms
- Alarm Conditions

Utilizing this information, the Data Com manager can make the crucial decisions necessary to fine tune and balance the network. Each line may also be further refined to greater efficiency, enabling planning and projection for growth.

RESALE

from page 89

resale of new and used IBM equipment, Dataserv has found success by offering something that IBM is unable or unwilling to deliver. In the parts business, overnight delivery of used IBM components can be worth more than a six-month lag time for new components; the company also stocks new parts from IBM.

But Dataserv is not bashful about competing directly with IBM. Armed with studies designating it the sixth-largest third-party computer maintenance organization, the firm has implemented a depot maintenance and service agreement with State Farm Life Insurance Co. in contiguous sales territories dividing the nation from the Canadian border to Texas.

Jim Meyers, company founder and president of the Dataserv Computer Maintenance, Inc. division, said he hopes to win a national agreement with State Farm but readily admits that "IBM will fight us dearly for that."

Concerned about IBM

The company also is concerned that IBM may become more aggressive in the parts business if the U.S. Department of Justice recommends approval of IBM's request to eliminate a 1956 consent decree. That court-sanctioned decree not only required IBM to end its lease-only equipment practice but also required it to sell parts and subassemblies on a nondiscriminating basis.

"If the consent decree is irrelevant [as IBM has claimed], why not leave it in place?" Meyers said. "Since the decree was put in place, nothing has really changed."

The supply of IBM parts is crucial to the maintenance business. And, Olson noted, "The greatest profit opportunity over the next five years is in the maintenance business."

Dataserv has revolved around IBM's world since Meyers started the company in 1969. IBM-related operations contributed greatly to the firm's 1984 revenue of $109.9 million and profits of $2.1 million.

Its initial thrust, and still a vital component of total revenue, was in trading and later leasing IBM 1490 check sorter devices. Although 12 years old and since replaced by the 3890 document processor, the 1490 still retains one-third of its value, according to Meyers. "We provide more check sorters [both older and newer models] than anybody other than IBM," he said. The company claims as customers 15 of the top 20 U.S. banks.

According to Meyers and Olson, equipment sales and lease revenue is about evenly derived from check sorters, 80% of which are leased; CPUs, about half of which are leased and half traded; and point-of-sale (POS) equipment, which is mainly a trading business and the only segment not dominated by IBM equipment. Trading in used POS equipment and reselling replaced equipment has been a profitable business that has gained the company an entry to provide maintenance service to retail operations, the company said.

Dataserv does much of its business on a transcontinental basis. For several years, the company had conducted business with a similarly structured firm based in London, the Premier Computers Ltd. group, which operates in several European countries. In 1980, the firms merged, retaining the officers of both companies.

Before the merger, Olson said that Premier "would provide us with a lot of check sorters from big banks in London; we'd bring them over here and convert them [to U.S. power configuration]."

Buy-out talks led to merger

When the companies started running into competitive conflicts, buy-out discussions eventually led to a merger, he said. In 1984, U.S. operations generated revenue of $64.5 million, and European operations generated $45.5 million.

In late 1983, faced with the need to raise outside capital to fund expansion plans, the merged company issued a public offering in London. "We thought the cost of the offering [in London] was about 60% to 70% of making the offering in the U.S.," Olson said.

In addition to a more receptive market in the UK than in the U.S. at the time, the move adds a little prestige. "We have a listing on the London exchange, instead of being listed over the counter in the U.S.," he said.

POSITION ANNOUNCEMENTS

Perhaps The Greatest Development Challenge A Systems Professional Has Ever Faced...

And You Will Be Right At The Center When You Join Us In The San Francisco Bay Area.

We Are Talking About One Of The Largest Development Projects Ever.

Bank of America has undertaken one of the largest systems development projects ever by a financial institution. Upon completion, Bank of America's International Banking Systems will link over 2500 terminals spanning the globe from Frankfurt to London to New York to San Francisco to Hong Kong. Utilizing IMS DB/DC technologies, the entire project will be centrally managed from San Francisco, so you'll be able to take advantage of our vast technological resources.

We Use Technology Aggressively And Strategically To Build Value, Quality And Service.

You will be involved in the development of a fully-integrated real-time global banking system. This system uses the most advanced technology to achieve worldwide delivery of financial services. You'll work in a new, highly responsive, multi-technology development environment—one designed to provide development capabilities equal to the IBS challenge.

Initially, you'll be working in San Francisco and will later move to Bank of America's new Bay Area Technology Center.

We Are Looking For The Right Experience.

We are particularly interested in talking with you if you have a proven track record in banking/financial systems applications development, and have worked in a large scale IBM MVS, IMS, COBOL environment with integrated on-line IMS DB/DC based systems. Demonstrated hands-on experience with systems design, programming and testing in a mainframe environment is required. All positions require superior analytical, written and oral communications skills.

We Have Exceptional Opportunities Available Now.

We have openings in Systems *Management*, as well as a wide range of technical positions. If you have a solid background in MVS, COBOL, IMS DB/DC, IMS ADF, in an integrated on-line environment and have 3 or more years experience in design, programming, testing or project planning, we would like to hear from you.

We Respect Diversity, Recognize Contribution, And Reward Achievement.

We're looking for results-oriented innovators to play a major role in the development of our global systems network. We offer an outstanding salary, benefits and relocation package designed to attract and maintain top professional talent.

We Are Prepared To Move Quickly. So Must You.

But we can't respond until we've heard from you. Please forward your resume and salary requirements to: Sr. Staffing Specialist, Global IBS Staffing, Dept. 3150-CW812, Bank of America NT & SA, P.O. Box 37000, San Francisco, CA 94137. An equal opportunity employer. *Only direct applicant inquiries will be considered.*

Share Our Strategy, Strengthen Our Team.

ALASKA ALASKA ALASKA

DATA BASE SPECIALIST

If a 5,000-mile communications network linking 13 major sites with 6 computer systems sounds challenging, the University of Alaska Computer Network would like to hear from you. We have an opening for a Data Base Specialist to work under the general direction of the Data Base Administrator on an IBM 4381-4 running MVS/OS, ISPF, and PanValet. Our data base is Cullinet's IDMS/R release 10.0 and support software consisting of ADS On-Line, Automatic System Facility, On-Line Query, and Culprit.

MINIMUM QUALIFICATIONS

Candidates for the Data Base Specialist position must have a demonstrated proficiency with IBM 4381 or equivalent mainframe running OS; OS JCL; IBM system utilities; performing in a data base environment and on-line applications.

Under the general direction of the Data Base Administrator, this individual performs the full range of data base requirements in support of user activities. These requirements include the data base management systems design, definition, organization, security, efficiency, documentation, generation, software installation, long-term requirements and operational guidelines. Minimum annual salary is $42,016.00.

Send letter of application, resume and three references to:

Statewide Office of Human Resource Development
University of Alaska
Room 1, Bunnell Building
Fairbanks, Alaska 99775

Closing date: August 24, 1985

The University is an AA/EEO employer and education institution.

If You're Ready to Move Beyond Yesterday's Communications Networks,

You're Ready for M/A-COM DCC.

Imagine yourself designing and implementing the most advanced, far-reaching developments in X.25 packet networks and satellite communications.

Then take a close look at M/A-COM DCC, where this pioneering work is happening right now.

M/A-COM DCC is a leading manufacturer in the telecommunications industry. We design, develop and produce advanced satellite and X.25 packet networks and products. We are also a leading supplier of telecommunications equipment to both domestic and international clients.

As part of M/A-COM Inc., a Fortune 500 company, we're always moving the industry ahead—reaching into new areas long before others get there. If you're an experienced and forward-thinking software engineering professional with a BS, MS or PhD who can contribute to our progress, we invite you to examine our current opportunities in:

- Satellite Communications
- Packet Switching Networks
- SNA Networks Relational Data Bases
- Micro/Minicomputers
- Computer Networking
- Data Communications
- Voice Networks

M/A-COM DCC is located on the Route 270 Corridor in suburban Maryland. Our suburban location is within easy access of Washington, D.C., the communications capital of the world. You will be free of the hassles of city traffic and parking and only a short drive from ski slopes, ocean resorts, sailing, and other year-round activities.

In addition to our attractive location, we offer you the excitement of being at the forefront of the rapidly expanding telecommunications field—complemented by excellent salaries, a comprehensive company-paid benefits package, and an extremely fast-growth career plan. For immediate consideration, send your resume in complete confidence to:

M/A-COM DCC

Computer Training

MS DOS

Our client, an international training organization, is rapidly expanding its practice. This has resulted in the need to increase their training staff for assignments at various U.S. locations.

These full-time positions represent a truly unique opportunity if you're currently teaching computer-related courses in either the academic or business sectors. You must have a working knowledge of integrated software products for IBM and/or compatibles. If you have an appropriate background, but lack teaching experience, our client will provide training instruction.

You will find an attractive compensation and benefits program accompanying this opportunity to expand your career horizons.

Please send your resume, including salary history in complete confidence to: Confidential Reply Service, Ref: 3662D, Austin Knight Advertising, 11 West 37th Street, New York, NY 10018.

We will forward correspondence to the client, therefore, companies in which you are not interested should be noted in a cover letter to the Confidential Reply Supervisor. All responses will be acknowledged.

Our client is an equal opportunity employer.

ALASKA ALASKA ALASKA

If a 3,000 mile communications network linking 13 major sites with 6 computer systems sounds challenging the University of Alaska Computer Network would like to hear from you. We have openings for programmers and analyst/programmers to do administrative applications development and enhancements on an IBM 4381 [illegible] running MVS/XA, [illegible], and PanValet. Our data base is Cullinet's IDMS/R release 10.0 and support software consisting of ADS On-Line, Automatic System Facility, On-Line Query, and Culprit. Programmer and user workstations are IBM PC's running micro-to-mainframe interactive communications and advanced Decision Support Systems software. We are looking for experienced people who have the demonstrated ability to be productive quickly in this environment in support of the installation and substantial enhancement of Information Associates' Student Information System and Human Resource System, and in migrating existing financial systems to the IBM 4381 mainframe. If the challenges of working on the frontiers of business application technology are what you seek, address a letter of application describing your accomplishments in data base or on-line applications, your resume and three references to us.

MINIMUM QUALIFICATIONS

Candidates for both the Programmer and Analyst/Programmer positions must have a demonstrated proficiency with IBM 4381 or equivalent mainframe running OS; OS JCL; IBM system utilities; programming on-line applications and COBOL.

PROGRAMMER (annual salary $32,448 to $37,968):

General knowledge of systems analysis and a strong working knowledge of programming; ability to independently test and debug programs and prepare documentation; to translate detailed logic flow descriptions into coded computer program instructions; to modify existing programs to accommodate changes in system requirements for equipment configurations; to design detailed record and form layouts; to prepare comprehensive computer functional descriptions; and to communicate well verbally and in writing.

ANALYST/PROGRAMMER (annual salary $37,315 to $43,482):

Knowledge of applications analysis and programming methods to utilize languages, hardware and tools in developing, coding and implementing applications; ability to work with client personnel to determine solutions and type of data to be processed, to analyze solutions in terms of operating system requirements and modify design to get maximum advantage of existing equipment; to establish efficient and effective procedures in support of automated systems; to work under limited supervision; to write, test and maintain computer programs; to devise data verification methods and standard system operational procedures; to prepare problem definitions and recommendations of equipment needed; to prepare detailed logic flows and machine instructions; and to communicate verbally and in writing.

TECHNICAL MARKETING SUPPORT

Harris, Florida's largest industrial employer, is a Fortune 200 corporation with sales of $2 billion. Our Computer Systems Division is a leading manufacturer of super-minicomputers. Due to expanded growth, the following positions are currently available.

CAD/CAM/CAE SUPPORT ANALYSTS

Responsibilities include identifying and assimilating third-party software packaging into Harris product lines. Your responsibilities will also include visiting vendor sites to evaluate software packages, as well as working with field sales support and sales personnel to implement customer systems. To qualify, you should have a BS/MS EE, CS, Physics (CS minor) or Math (CS minor) with CAD experience. In addition, 3–5 years' experience in CAD/CAM/CAE is also required. Direct experience with major mechanical CAD packages is required; ANVIL is preferred.

SENIOR MARKETING SUPPORT SPECIALIST

Responsibilities include benchmark analysis against competitive machines (hardware/software) in a Marketing Support environment. To qualify, you must have a BSCS or BSEE and heavy software relevant systems analysis experience with superminicomputers. Compiler expertise in FORTRAN and UNIX™/ADA/PASCAL experience is desired.

Harris Computer Systems Division offers a competitive salary/benefits package, a formal merit review program and a delightful south Florida location. To find out more about these outstanding career opportunities, forward your resume, including salary requirements to: Jan Jeter, Harris Computer Systems Division, Dept. CW, 2101 W. Cypress Creek Road, Ft. Lauderdale, FL 33309-1892.

LOOKING?

Find the job you want in Computerworld's classifieds. No other publication carries as many ads for computer professionals as Computerworld, so no other publication can give you as wide a choice of jobs, salary and location as Computerworld. You can even try a "Position Wanted" ad to look for exactly what you want, where you want.

Be sure you look over our recruitment ads every week, so you don't miss the opportunity that's just right for you.

DATABASE ANALYSTS

Few companies can boast such a commitment to professionalism as GESCO. That's because few companies provide their data processing professionals with the finest technology available. We use the latest multiple IBM mainframes (30XX, 43XX) within an OS/MVS JESII environment. In addition, our database environment (IDMS-R) and our ACI base 24 software offer us challenging new systems capabilities. We customize software to meet diverse client needs.

As a proven leader in financial information processing, GESCO continues to assemble the finest talents, offering opportunities as:

DATABASE ANALYSTS

With at least 3 years experience as a Database Analyst (preferably IDMS) your duties will include participating in the development of logical and physical database design along with application design reviews plus interfacing with internal staff and vendor to develop requirements and the maintenance of new releases as well as problem resolutions.

At GESCO, individual contributions are recognized and rewarded with growth potential, excellent salaries and a wide array of benefits. All of this is set in the friendly community of Fresno, known for its affordable housing, quality education and easy access to all the recreational riches of California. Turn the ability you have into the recognition you deserve. Forward your resume in confidence to: A.J. Newborne, GESCO Corporation, 1455 E. Shaw Avenue, Fresno, CA 94710. 1-800-65 GESCO. An Equal Opportunity Employer M/F.

SAUDI ARABIA
DP CAREER OPPORTUNITIES

The Computer Department at the Ministry of Planning is seeking highly motivated individuals to play a major role in the definition, design, programming and implementation of business, planning and socio-economic systems.

The Ministry of Planning of the Kingdom of Saudi Arabia is responsible for the preparation of the national 5-year development plans and the monitoring of their implementations.

The mandate of the Computer Department in the Ministry of Planning is to provide computer support to its different departments by developing necessary models and systems, and maintaining existing ones.

These systems are being developed on an IBM 4341 VSAM/TSO/ISPF using mainly ADABAS/NATURAL but also COBOL, FORTRAN and SAS.

A number of immediate opportunities are available for DP professionals in the following areas:

OFFICE AUTOMATION MANAGER

MS required in Computer Engineering or Computer Science or equivalent. At least 8 years experience in Data Processing out of which at least 4 years must be in managing and implementing office automation technology. Must have the experience of using the microcomputer software (DBASE II, WP, Spread-sheet etc.). Ideal candidate will also be familiar with the Arabic language business systems and development software. Interpersonal skills and ability to train users.

SYSTEMS ANALYSTS

BS/BA required as a minimum. Must have at least six years experience in DP and a proven track in the following areas: Requirement analysis, project responsibilities from inception through completion, excellent written and verbal communication skills, familiarity with conventional languages, hands-on experience in ISPF, knowledge of data base concepts, experience in using systems development methodologies and in preparing documentation for all phases of the systems development life cycle, experience in statistical modelling is a plus.

PROGRAMMER/ANALYSTS

BS/BA required in CS or related discipline, must have at least four years experience analyzing, designing, programming, testing and maintaining business application systems on IBM mainframe, good knowledge of COBOL and/or PL/1 essential, familiarity with FORTRAN and NATURAL is a plus, good communication skills. Familiar with systems development methodologies and documentation of application systems.

COMPUTER PROGRAMMERS

BS/BA or equivalent diploma required. Must have at least three years experience in preparing program design and specifications, programming and testing business application systems on IBM mainframe, experience in using different access methods including VSAM and data base management systems, good communication skills.

TRAINING INSTRUCTOR

BS/BA required in CS or related discipline. Must have at least five years experience in DP two of which in computer teaching and preparing training materials, excellent written and verbal communications skills.

For all positions, bilingual applicants (Arabic, English) are preferred. All positions are offered on a 2-year contract basis. Excellent benefits package includes free medical care, housing and furniture allowances, education allowances for children, transportation and maintenance allowance, 45-day annual leave and a yearly round-trip ticket to the location of the present residency.

Applicants should immediately send resume including telephone numbers, references, recent passport-size picture, salary history and desired position to:

Computer Department, Ministry of Planning
P.O. Box 358
Riyadh 11411, Kingdom of Saudi Arabia

Telephone: ([illegible]) 01-401-[illegible]
Telex: [illegible] PLAN SJ

Last date for submission of applications is September 4, 1985.

CUSTOMER SUPPORT REPRESENTATIVES
Chicago and New Jersey Offices

GROUND FLOOR OPPORTUNITIES IN A YOUNG, FAST-GROWING, AGGRESSIVE COMPANY

XA SYSTEMS is a fast-growing, aggressive company positioned to become a market leader in on-line development center software for IBM mainframe users.

We are seeking motivated professionals with 2-5 years experience in customer support and/or application development for our Chicago (O'Hare) and Northern New Jersey (Saddle Brook) offices. Knowledge of MVS, TSO/ISPF, IMS, and COBOL is required. Excellent communication/presentation skills and a high standard of professionalism are also important.

Your role in Customer Support will involve a variety of activities:
- training customer personnel in the use of the XPERT series of products
- assisting sales personnel in on-site demonstrations/presentations to prospective customers
- providing the first line of support for customer questions and problems

We offer an excellent compensation package including stock options, a complete benefits plan, and a pleasant, dynamic small company environment. For immediate consideration, please send your resume to Richard Armstrong.

MANAGEMENT INFORMATION SYSTEMS POSITIONS

St. Louis Public Schools
St. Louis Missouri

The St. Louis Public Schools system has openings for the following positions. These are career opportunities for Data Processing/MIS professionals who have experience in an IBM 4341 environment with MVS, TSO and CICS.

MANAGER SYSTEMS SOFTWARE

Responsibilities include the installation and maintenance of very complex operating systems software, database packages, compilers, assemblers and utility programs. Qualification requirements: A BS degree in Computer Science plus experience in Assembler language programming and systems software management, or equivalent experience and training.

MANAGER DATA ADMINISTRATION

Responsibilities include the design and control of the organization data structure, and the development of policy and standards for the youth of data, incorporating new and existing database management systems. Qualification requirements: a BS degree in Computer Science plus experience in database administration, including FOCUS and TOTAL, or equivalent experience and training.

MANAGER DATA COMMUNICATIONS

Responsibilities include the installation and maintenance of all data communications equipment for the organization, including central and remote mainframe mini and micro-computers. Qualification requirements: a BS degree in Computer Science plus experience in electronic communications hardware and software, or equivalent experience and training. Experience and training in designing, installing and maintaining voice communications systems required.

SUPERVISING SYSTEMS ANALYST

Responsibilities include the planning and management of complex applications systems including their design, development, implementation and modification. Qualification requirements: considerable experience in programming and analysis with structured systems methods, and experience in supervising and training programmers/analysts.

SYSTEMS PROGRAMMER

Responsibilities include the programming and analysis of operating systems software. Qualification requirements: minimum of 2 years' experience in applications and software programming.

HOW TO APPLY: Call (314) 231-3720 Ext. 295 or 379 for an application; or send detailed resume that includes salary history by August 23, 1985 to:

Non-Certificated Personnel Division
St. Louis Board of Education
911 Locust Street
St. Louis, MO 63101

We are an Equal Opportunity Employer M/F/H

M & D HR PLUS

Consultants and Programmer/Analysts with two to ten years experience in all areas of M & D HR + available for consulting, analysis and contract programming services, short term and long term.

Rates are available on an hourly, daily, weekly, monthly or fixed price project basis. All individuals have long term, direct, hands-on experience in the development and maintenance of M & D HR + and also in providing consulting, analysis, and programming services to users and prospective users of the system.

AI product deluge hits DP market

Mainstream vendor releases on eve of major conference seen hastening corporate acceptance of AI technology

Will 'big boys' hurt pioneers?

By John Gallant
CW Staff

Recent artificial intelligence product unveilings by IBM, Digital Equipment Corp. and Control Data Corp. indicate that AI is growing out of its infancy. The spate of announcements may have been prompted by the International Joint Conference on Artificial Intelligence, being held in Los Angeles this week, where a number of AI-related products are expected to be introduced and demonstrated.

The availability of AI tools from mainstream manufacturers, analysts said last week, will make it easier for DP managers to begin experimenting with the emerging AI technologies. On the other hand, they lamented the fact that the entrance of what one of them called "the big boys" into the AI market could also spell trouble for the firms that first broke ground in the field.

"In one sense, you can say that IBM and DEC have legitimized AI by offering products," said Howard Dicken, publisher of "AI Trends," a newsletter put out by DM Data, Inc., a Scottsdale, Ariz.-consulting firm. "DP managers now have an easier path to follow in experimenting with AI."

Karl Wiig, director of Cambridge, Mass.-based Arthur D. Little, Inc.'s Artificial Intelligence Program, agreed. Wiig said companies will be more willing to explore potential AI applications that use existing hardware, software and personnel.

"We think more firms will begin to ex-

DEC: workstation CDC: AI languages

Artificial intelligence products unveiled this month by Control Data Corp. and Digital Equipment Corp. further highlight a market segment gathering momentum.

DEC's AI Vaxstation was built around the Microvax II and comes bundled with VAX Lisp, DEC's implementation of the Common Lisp language standard. The firm also announced agreements with third-party vendors to provide high-level AI tools to complement DEC's base-level language offerings (see story page 4).

CDC offered users of its Cyber 180 mainframes two high-level AI programming languages as well as an expert system development environment, which takes advantage of the 180's large virtual and real memory capacities. The company also announced a package of programming tools for its NOS/VE operating system (see story page 5).

IBM unwraps expert tools

By John Gallant
CW Staff

WHITE PLAINS, N.Y. — IBM has brought the worlds of artificial intelligence and mainstream DP more closely into line with the introduction of an expert system development tool and a Prolog language environment for its VM operating system. IBM unveiled the products earlier this month but did not distribute the information to users until last week.

IBM's Expert System Environment/VM and its VM Programming in Logic, slated for September availability, were both designed to aid users in building expert systems and other AI programs — which can draw information from existing IBM systems — in an IBM mainframe environment.

The tools facilitate research and development without requiring specialized AI hardware, IBM said. The debuts were met with praise from AI analysts and researchers, many of whom nevertheless criticized IBM for its wait-and-see approach to providing commercial AI tools for its users (see story far left).

IBM's low-key announcement came amid a flurry of recent AI-related activity that saw additional product unveilings from Digital Equipment Corp. and Control Data Corp.

According to an IBM spokeswoman, VM Programming in Logic is IBM's implementation of Prolog — one of two symbolic manipulation languages, Lisp being the

Go ahead, make my DEC: Olsen speaks

By Clinton Wilder
CW Staff

The overstuffed armchair in the corner of the corporate interview lounge is wasted on Ken Olsen. The 59-year-old founder and president of the world's second largest computer company is usually on the chair's edge, stridently defending Digital Equipment Corp.'s microcomputer strategy or attempting to quash the latest rumors of a marriage between DEC and AT&T. When someone is as supremely confident of the future success of his company as Olsen is and wants the world to know it, it is not easy to relax.

In an interview with *Computerworld* last week that touched on many topics, Olsen disclosed that he has set a date when he will relinquish the DEC helm, but he would not divulge the details.

"Without a date, one never leaves," Olsen said, adding only that the date is still not imminent. When it does arrive, he predicted, DEC will have sailed through a minicomputer industry shakeout to strengthen further its position as the leading vendor of mid-range computer systems.

"Right now or very soon, we might be able to make all the minicomputers the world needs," Olsen said. "There is not room for many manufacturers in that market. That means there are going to be exciting changes in this world of ours. There will be some things that we want nothing to do with because they're too easy for others. But there are some things that take size and technology to

Mini firms eyeing more cuts

By Peter Bartolik
CW Staff

Actions by several minicomputer systems vendors last week demonstrated that the widespread sales slump has yet to run its course.

AT&T Information Systems responded to a printed report of impending layoffs by telling employees that it is considering cost-cutting measures. Motorola/Four Phase Systems, Inc. announced a consolidation and reorganization. Meanwhile, Harris Corp. reported a loss in its semiconductor operations and reduced profits in its information systems businesses, with no likelihood of any improvement by the end of the year.

Additionally, Westford, Mass.-based Massachusetts Computer Co. (Masscomp) said it has cut salaries by 6% to 12% and instituted other measures to lower expenses "during the current period of unfavorable business conditions." Masscomp manufactures 32-bit systems.

> *Masscomp said it has cut salaries by 6% to 12% to lower expenses 'during the current period of unfavorable business conditions.'*

AT&T Information Systems declined to respond to a *Wall Street Journal* report that a large round of layoffs is imminent, but the top executive of the AT&T division informed employees that some cost-cutting measures are likely.

A company official told *Computerworld* that Robert E. Allen, chairman and chief executive officer of the group, reassured several hundred employees that they would be the first to hear of any cost-cutting decisions.

Allen's meeting was Wednesday morning, the same day as the *Journal* report, but had been scheduled previously. The executive reportedly told employees that the group has had successes in its markets but that the company must now make those successes pay off "on the bottom line."

The group is attempting to cut costs and is currently trying to determine how, in what way and when to do so, Allen said.

At Motorola/Four Phase, a minicomputer and microcomputer systems manufacturer, there has been a restructing into two separate business units, according to Dan Halloran, Motorola/Four Phase's vice-president of human and physical resources. The company's minicomputer business unit will remain based in Cupertino, Calif., where the company is headquartered. The microcomputer business unit, which manufactures systems that use AT&T's Unix operating system, will be relocated to existing facilities in Tempe, Ariz.

Approximately 500 employees will be affected throughout the company, but all affected employees of the micro business unit will be invited to relocate to the Tempe facility, Halloran said. In a prepared statement, the company said the reorganization was initiated "to increase emphasis on our product lines and to position ourselves [better] to come out of the current industry slump." Halloran said that efforts will be made to relocate employees within the company and that others will be offered services for outplacement. He declined to reveal total employment figures.

Melbourne, Fla.-based Harris reported last Tuesday that revenue for the fiscal year ended June 30 was up 14% from the previous year to $2.3 billion but that profits declined to $80.3 million, or $2 per share, from year-earlier profits of $80.4 million, or $2.02 per share.

In the fourth quarter, however, profits were $16.1 million, or 40 cents per share, down 33% from the year-earlier level of $23.9 million, or 60 cents per share. Revenue increased 4% to $610.4 million.

Harris reported that semiconductor sales were up for the year, but profits were down because of reduced demand and lower prices. The company also reported that operations from that sector posted a loss in the fourth quarter. Information systems products had a marginal increase in sales for the year, but profits were down substantially because of price competition and the strength of the dollar in overseas markets, the company said.

Joseph A. Boyd, chairman of the company, said in a prepared statement that there are no signs of an upturn in the DP and chip markets during the remainder of the calendar year and that profits for that period are expected to be significantly lower than the comparable period last year.

CORRECTIONS

The quarterly financial results reported for Tektronix, Inc. last week were incorrect [CW, Aug. 12]. For the fourth quarter ended May 25, the Beaverton, Ore., company posted profits of $29.9 million, or $1.45 per share, down from $31.2 million, or $1.60 per share, in the year-earlier quarter. This figure excludes a one-time extraordinary gain. Revenue was $373.7 million, down from $378.9 million in the 1984 fourth quarter.

Tektronix earned $90.2 million, or $4.41 per share, in the fiscal year ended May 25, up from $79.3 million, or $4.06 per share, in fiscal 1984, minus the one-time gain. Tektronix's sales for the year were $1.43 billion, up from $1.33 billion in fiscal 1984.

An article on Digital Equipment Corp.'s fourth-quarter financial results incorrectly referred to a first-ever fourth-quarter-to-first-quarter revenue dip [CW, Aug 12]. The company traditionally experiences a first-quarter decline in revenue from the proceeding quarter.

The Update section on printers contained a cost-justification chart on page Update/17 in which several of the recommended calculations were incorrectly stated [CW, Aug. 5]. A correct version of the chart can be obtained from its creator, C. A. Pesko Associates, Inc., which is located at 1 Snow Road, Marshfield, Mass. 02050.

The number of printers predicted to be shipped will grow from 6.4 million units this year to 15 million printers in four years, unlike previously reported in the Update section on printers [CW, Aug. 5].

WHODUNIT

Sortland Yard warns against "Raffles-type sort programs."

Call (201) 568-9700.

Ask for Inspector SyncSort!

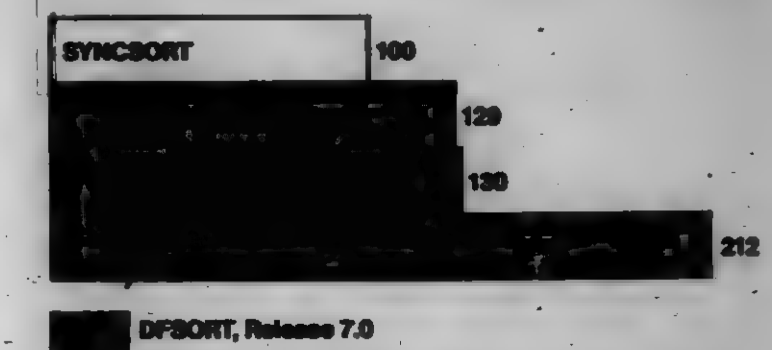
In an extraordinary move, Sortland Yard today warned data processors throughout the world to be on guard against what it termed "gentleman-bandit sort programs."

The warning was issued by one of the Yard's best known figures, Inspector SyncSort, who has sometimes been called "a legend in his own CPU time."

The inspector said, "One of the difficulties in apprehending these chaps is that they look so eminently respectable. They're members of a fine old hardware family. They've been to the right schools. And they invariably carry out their burglaries while wearing a dinner jacket from Saville Row."

EXPERT COMPUTER CRACKERS. "But once the party is underway," the inspector said, "these chaps head straight for the place where the family jewels are kept. They can crack open a computer and make off with a king's ransom in computer resources before you can say 'Hound of the Baskervilles.'"

To indicate "the true cost of this sort of misbehavior," the inspector released the following crime statistics:



SOMETIMES TAKE HOSTAGES. The inspector noted that these black-sheep programs often "take a dreadful toll" of programmers. "They are often tied up for days on end and forced to perform unnecessary coding, compiling and debugging. And they are heartlessly deprived of the labor-saving features that are taken for granted in most parts of the civilized sorting world."

Among these the inspector listed:

- **SORTWRITER**
- **MULTIPLE OUTPUT**
- **RECORD EDITING**
- **FAST FILE COPY**
- **MAXSORT**

TELEPHONE BEST DEFENSE. The inspector urged data processors to call the Yard immediately if they suspect their center is infested by a Raffles-type sort program. "The number is (201) 568-9700. We'll send over one of our highly trained sort detectives to track the culprit down."

Questioned as to what would be done with sort programs caught burglarizing computer centers, the inspector replied. "They will be given a just and speedy trial. If found guilty, they will immediately be transported to Iran!"

DEC unwraps AI workstation based on Microvax II

Inks third-party software agreements, upgrades OPS5

By Eric Bender
CW Staff

HUDSON, Mass. — Joining this month's parade of new artificial intelligence products, Digital Equipment Corp. has introduced an integrated AI workstation built around the Microvax II. The AI Vaxstation is a fully integrated system that comes bundled with VAX Lisp, the company's implementation of the Common Lisp language standard, and carries a starting price of $48,690.

DEC also announced an upgraded version of its OPS5 expert system development language; an agreement with Quintus Computer Systems, Inc. to sell the Quintus Prolog language for VAX systems; and plans for Artificial Intelligence Corp. to develop VAX versions of its Intellect natural language information management software.

The third-party software announcements demonstrate DEC's AI software strategy of offering base-level languages and development tools itself while working with other vendors to provide higher level tools, said Art Beane, manager for product management and product marketing in DEC's Artificial Intelligence Technology Group.

Scheduled for December availability, the AI Vaxstation is targeted at aerospace, petrochemical, finance, government and academic/scientific research markets, Beane said.

Fortune 1,000 firms most likely initial buyers

Fortune 1,000 corporations are the most likely initial commercial buyers, because "the technology is a fairly expensive technology to look into, and only the largest companies now have the funds," he said.

The AI Vaxstation offers compatibility with standard VAX software, hardware and communications, including hooks into IBM mainframe environments.

"We're taking a general-purpose computer and allowing it to extend the current computing environment," said Joel Magid, senior product manager in DEC's Artificial Intelligence Technology Group. This approach preserves customer investments and simplifies the task of integrating the new machine into DP/MIS operations, he said.

In academic and research markets, the system is not expected to replace dedicated Lisp machines in AI work that demands very high performance and for which price is not an issue, Beane said.

However, he predicted a larger role for the Vaxstation in general computer science courses, because "you can't afford a $170,000 Lisp machine for every student."

A base configuration includes a Microvax II processor with 5M bytes of internal memory (expandable to 9M bytes), 71M-byte hard disk drive, 95M-byte tape subsystem, Decnet/Ethernet interface, a 19-in. monochrome monitor with 1,024- by 860-pixel resolution, keyboard, mouse, VMS operating system and a version of VAX Lisp that integrates more than 150 graphics functions. Disk storage can be expanded to 213M bytes.

The main difference between the new system and a standard Vaxstation is the absence of a floppy disk drive in the AI Workstation.

Version 2 of the VAX OPS5 software tool, available in October, is now a fully supported member of DEC's family of VMS layered products, the company said. Among enhancements, both compile and runtime performance have been significantly improved. Prices range from $3,000 for the Microvax II to $7,500 for the VAX 8600.

Under DEC's three-year marketing agreement with Quintus Computer Systems, Quintus Prolog is being offered for both VMS and DEC's Ultrix-32 operating systems. Cost is $6,000 for the Microvax II and $17,000 for the VAX-11/730 through VAX 8600.

A five-year agreement with Artificial Intelligence will permit DEC to sell VAX versions of Intellect software that run under VMS and interface to the VAX RDB relational data base software. No prices or scheduling details were released.

DEC is located in Maynard, Mass. 01754.

IBM

from page 1

other, which are currently the most widely used AI development languages. In general, Lisp has held sway among U.S. AI researchers, while Prolog has won the allegiance of developers abroad, most notably in Japan.

In addition to its usefulness in building expert systems — programs that capture and apply the knowledge and reasoning of a specialist in a given field — IBM's Prolog is geared to the development of AI systems for automated deduction, natural language processing, relational data base management system access, knowledge representation and processing and robotics.

Extensive data base searching

Most AI processing is not based on algorithms, as are the majority of traditional applications, but rather on extensive data base searching. As a result, VM Programming in Logic is said to provide what IBM called a built-in mechanism for "nondeterministic top-down, left-right searching with controlled backtracking."

The product also features debugging facilities and the ability to communicate with IBM's VM/SP, SQL/DS and the Lisp/VM environment. VM Programming in Logic will have a one-time charge of $8,000.

The spokeswoman said the Expert System Environment/VM, implemented in Pascal, consists of two complementary systems for the development and execution of expert systems under VM.

The Expert System Development Environment/VM (ESDE/VM) allows a developer, known as a knowledge engineer, to work with an expert to build a knowledge base made up of facts about a particular subject, definitions and rules describing relationships between objects.

The Expert System Consultation Environment/VM (ESCE/VM) enables a user to consult the system to obtain advice or information. ESCE/VM must be in place to operate ESDE/VM, but once a knowledge base has been developed, it can be copied and used by ESCE/VM without ESDE/VM.

ESDE/VM incorporates what is known as an editor program that lets a knowledge engineer build a knowledge base by inputting English-like rules, parameters and controls. The system also provides utilities for syntax checking and debugging. Manipulation of the knowledge base for the creation, deletion, replacement and retrieval of objects and values takes place in main storage. Although that results in the need for additional virtual storage, IBM said it facilitates more rapid searching.

ESCE/VM sets the expert system's inference engine — the reasoning and dialogue manager — in motion. It boasts two basic inference processing functions known as backward and forward chaining. The process of backward chaining allows a user to start with a goal and search backward to find supporting data. Forward chaining involves working with known data to discover facts or goals.

Reduces required storage space

Expert System Environment/VM allows a designer to break a complex problem into smaller subproblems that can be solved independently. Objects entered into the knowledge base are compiled automatically by the system into a form that reduces the amount of required storage space and improves processing. The system offers on-line Help and allows a user to ask what, why and how to receive more detailed explanations of requests for information and reasoning processes involved.

The tool also allows a knowledge base developer to invoke external procedures or acquire data from external sources such as an IBM CMS file or data base.

IBM identified a wide variety of possible expert system applications that it said could be developed efficiently and rapidly with Expert System Environment/VM. Such applications include insurance underwriting and claims processing, financial planning and investment analysis, medical diagnosis, quality assurance, training, product configuration, network and project management and shop floor scheduling.

Expert System Environment, according to the spokeswoman, requires the use of its VM/CMS, the Graphic Data Display Manager, the Pascal/VS compiler and the DCF. The development portion has a one-time fee of $35,000 or a monthly charge of $1,750; the consultation portion has a one-time fee of $25,000 or a monthly charge of $1,250.

Additional information is available from local IBM sales representatives.

CDC AI tool offerings capitalize on memory capacities

By John Gallant
CW Staff

MINNEAPOLIS — Contributing to the deluge of artificial intelligence tools unleashed recently by large systems hardware vendors, Control Data Corp. offered users of its Cyber 180 computers two high-level AI programming languages and an expert systems development environment. CDC said the AI tools take advantage of the 180's virtual memory and large real memory capacities.

Lisp/VE, CDC's implementation of the emerging Common Lisp standard embraced by a variety of important industry players, can process massive amounts of both symbolic and numeric data, a spokesman said. Full implementation of the Common Lisp specification will be achieved in two releases of the product.

The initial release described by CDC provides a base of functions for most AI programming applications. A future release is slated to complete the specification and offer a compiler designed to improve the performance of production Lisp code and a debugger to increase productivity.

Lisp/VE features a command that allows users to execute operating system commands from within Lisp. Communications between Lisp/VE and external programs are handled by executing the external programs through the command and transmitting data using Ascii files. The Cyber 180's System Command Language provides for data exchange between Lisp/VE and Fortran files.

A version of C-Prolog, CDC's Prolog/VE is a programming language that uses English-like statements of logical relationships together with rules governing the interaction of the relationships. The product consists of an interpreter and an interactive programming environment with tools for incremental program construction, debugging and program modification. A user can edit programs while still within the Prolog system, the spokesman said.

The Knowledge Engineering System/VE (KES/VE), jointly developed by CDC and Arlington, Va.-based Software Architecture and Engineering, Inc., is a set of tools simplifying the development of expert systems.

KES/VE is said to incorporate a range of inference techniques that allow an expert system built with the product to address problems in the most effective processing fashion. The system features a parser for detection of errors.

In addition to the AI programming tools, CDC also unveiled a package of programming tools for its NOS/VE operating system.

The NOS/VE Programming Environments, which support both Fortran and Cobol, combine compilers, editors, debuggers and reference aids. The tools allow a user to develop, debug and install NOS/VE applications without knowledge of the system's command language.

Lisp/VE is priced from $5,166 to $40,614; Prolog/VE from $4,620 to $36,330; KES/VE from $11,424 to $70,594; and the NOS/VE Programming Environments from $1,848 to $14,832, depending on the host.

More information is available from CDC, Computer Systems, P.O. Box 0, HQW09G, Minneapolis, Minn. 55440.

AI

from page 1

periment, and that is desirable," Wiig said. "Organizations will be able to bring this new technology in-house and begin to form opinions about it."

But Wiig and Dicken, along with David Hertz, director of the University of Miami's Intelligent Computer Systems Research Institute, pointed out to smaller firms the danger of the growing role of large vendors.

"Who will this hurt? The small guys," Hertz said. "If the Fortune 500 users start talking to the mainframe manufacturers about AI, then it has indeed become a legitimate field. It is no longer blue sky, so to speak. But the small guys will have to have something very good to stay in the market. The AI people have earned their successes by doing things nobody else wanted to bother with. That will not be quite so easy to do in the future. They will have to find special niches."

According to Dicken, an analogy can be drawn to IBM's introduction of its Personal Computer. "IBM's AI systems announcements will not really affect anybody just yet," Dicken said. "But there are some parallels to the micro industry. IBM seems to be doing the same thing it has done in that area. It waited until the early companies broke ground, and then it came in with its own offerings. Some of the smaller companies are bound to get hurt."

While all of the analysts contacted pointed to next week's IJCAI as an immediate spark for the the flurry of product announcements, they also stressed that user interest in AI technologies is also a major factor.

"Nobody would argue that the vendors aren't trying to sell more hardware or make their boxes more useful," Hertz said. "But [the announcements] are primarily a response to what is happening out in the field. Mainframe customers are asking their vendors, 'What are you doing with AI? What should we be doing?' This is clearly more user driven than vendor driven."

Union Carbide modeling program given wrong data

By John Desmond
CW Staff

INSTITUTE, W. Va. — A computer modeling program is the focus of a debate on what caused a delay in notifying neighbors of a West Virginia chemical plant that a toxic gas cloud had been released.

Approximately 135 people were hospitalized after the aldicarb oxime gas cloud from a Union Carbide Corp. plant here passed over a four-town residential area early in the morning of Aug. 11.

The modeling program, a package called Safer System from Safety Emergency Systems, Inc. of Westlake Village, Calif., reportedly predicted the gas cloud would remain stable over the plant. Therefore, Union Carbide officials delayed notifying local authorities about the leak for 20 minutes, and an emergency siren was not sounded until after 36 minutes. The gas cloud, however, moved off site and caused illness.

Union Carbide officials said that the company's Safer System was not programmed to track aldicarb oxime, a pesticide ingredient. Instead, an operator relied on methyl isocyanate (MIC) data to judge the behavior of the cloud, the officials said.

The modeling software, which runs on a 32-bit Wicat Systems, Inc. microcomputer, combines the dispersal rates and properties of specific gases with weather factors such as wind speed and direction. The model then predicts where and how fast a cloud will disperse. The Wicat micro, based on the Motorola, Inc. 68000 microprocessor, needs 1M byte of main memory and runs the company's WMCS operating system.

The president of Safety Emergency Systems, Gary Gelinas, said the use of substitute chemical data would result in an incorrect prediction. "It's the old story — garbage in, garbage out," he said.

Thad Epps, Union Carbide's regional coordinator for public affairs, conceded that the program had no data on aldicarb oxime and the model's prediction was inaccurate. "There was gas in places where the system said it would not be," he said.

A spokesman for a competing modeling software firm agreed that the substitution of data on a different gas than that released may have caused the model to make the wrong prediction. Anish Puri, a lead software engineer with Environmental Research and Technology, Inc. of Concord, Mass., said, "The type of chemical would strongly affect the information from the model. The model gives you as good a result as the input it gets. Evidently, [the Union Carbide operators] didn't ask it the right questions."

Programmed for three chemicals

The Safer System program was programmed with data on three chemicals. Data on seven additional chemicals of the hundreds used in the plant was available but had not been added to the system yet, Gelinas said.

The Safer System was installed at the Institute plant after the Dec. 3 leak of MIC from the Union Carbide plant in Bhopal, India, which killed at least 2,000 people. When asked why aldicarb oxime was not part of the program, Epps responded, "We've got literally hundreds of chemicals here. We must make some sort of judgment."

Richard H. Schulze, president of Dallas-based Trinity Consultants, Inc., specialists in emission dispersion modeling, said the wrong prediction could also have been the result of inadequate weather data. "Their problems may have been with meteorology," Schulze said. "They almost would have been better off without the system. They trusted equipment that gave them erroneous information."

The fact the aldicarbe oxime is located 150 yards away from the MIC at the plant would have created a location error, he said, suggesting that this error would not have caused the model's prediction to be so far off. Gelinas said Union Carbide did have two weather stations on-line to the Wicat.

Schulze questioned the reliance on emission dispersion models based on on-line data such as wind speed. "These programs have been sold to safety people as opposed to engineers, because [the systems] provide good [public relations], are attractive visually and can provide a fairly inexpensive way of dealing with a problem you hope you'll never have," he said. "You're better off planning ahead of time and then implementing an emergency plan when the disaster occurs."

Asked whether Union Carbide would have been better off not using the Safer System without the correct chemical data, Gelinas said, "That's a hard question to answer. If they tried to use it to verify a visual sighting, I would say 'no.' But to use the system set up for warning and evacuation with incorrect data would lend itself to a result that was not appropriate. If you put the wrong information in, you won't get the right information out."

IBM to drop disk supplier

By Edward Warner
CW Staff

CHATSWORTH, Calif. — IBM has decided not to renew its 1985 contract to buy 20M-byte hard disk drives from Computer Memories, Inc. (CMI), located here, for use in its Personal Computer AT. The contract expires Dec. 31.

Sales to IBM had accounted for 67% of CMI's revenue in the fiscal year ended March 31 and for 81% of CMI's revenue for the first quarter of the 1986 fiscal year, CMI said.

The Personal Computer AT, introduced one year ago this month, had been plagued with hard-disk problems, some of which IBM has since attributed to a flaw in a chip on the disk's controller card.

Complaints about the AT's hard disk were strongest in the first months after the product shipped. IBM has said that CMI was its sole supplier of Personal Computer AT hard disk drives until the second quarter of this year. The drives are now being made by other suppliers, including IBM.

In confirming reports of IBM's decision, an IBM spokeswoman denied it had anything to do with the high failure rate of the drives. The decision to drop CMI as a hard-disk supplier was made, she said, because "the demands of the marketplace" had changed. That did not mean, she added, that AT sales were in a slump.

CMI's chairman and Chief Executive Officer Irwin Rubin said CMI was disappointed by the decision, but will continue its product development and marketing efforts.

CMI faces a "difficult marketing task" to recoup the sales that will be lost because of IBM's decision, according to David Moy, a computer storage systems analyst with Morgan Stanley & Co., Inc. in New York. The market for personal computer storage systems, he said, is currently depressed.

Big Blue's baby turns four

Micro given credit for changing industry

By Edward Warner
CW Staff

President Reagan was celebrating the biggest tax cut in U.S. history, the air traffic controllers were on strike, and Lady Diana and Prince Charles were basking in matrimonial bliss.

It was August 1981, the month in which the IBM Personal Computer was born.

A story in *Computerworld* told of how the machine's debut Aug. 12, 1981, marked a departure from IBM tradition; it was to be sold by retail stores — Sears Roebuck & Co. and Computerland Corp. — and third-party software developers were being encouraged to write programs for it. An air-conditioned room would not be required, the story noted.

One software developer, Dave Tarrant, president of Graphic Communications, Inc., was so intrigued that he phoned IBM for details on the new machine. He received a photocopied sheet of technical specifications.

The technical specifications were far more simple than those for today's Personal Computer. When introduced, the machine offered from 16K to 256K bytes of memory and, among other things, a port for use in storing data on a cassette tape recorder. With a monochrome monitor, two diskette drives and 64K bytes of memory, it cost about $4,000.

Today, a Personal Computer comes standard with two diskette drives and 256K bytes of memory and is priced at $2,295.

In the four years since its debut, the Personal Computer "pretty much changed the whole personal computer industry," according to Egil Juliussen, chairman of the board of Future Computing, Inc., a Dallas-based research firm specializing in personal computer topics. The machine, he said, "was the one thing that got the businesses to go on a buying binge for personal computers."

By the end of this year, approximately 4.4 million Personal Computers will be in use around the world, according to Chris Christiansen, senior analyst with the Boston-based Yankee Group.

The Personal Computer, Christiansen observed, "lessened the domination of the data processing department" over its users.

Cigna Corp.'s Bloomfield, Conn., life insurance and investments division was an early user of the Personal Computer and has since installed more than 100 of them.

When Rich Reed, the man who was to become that division's manager of office systems, first saw IBM's future wunderkind, he said he knew its potential exceeded that of any personal computer then in use there, but he had no idea of just how much memory his firm's users would eventually want.

"We thought that 256K [bytes] was a pretty big machine," he recalled. "Something like 320K [bytes] or 512K [bytes] was just enormous."

Sales of the Personal Computer are currently in a slump, and, with four years under its belt, the machine is looking like a mature product, at least in IBM's standard product life cycle. For those reasons, analyst Juliussen predicted the Personal Computer is unlikely to reach age five and will be replaced by its hard disk-equipped big brother, the Personal Computer XT.

OLSEN

from page 1

do, but boy, once we get going with ours . . . That [Microvax II], when we get orders and start pouring those out, we're going to pour them out in huge quantities."

Olsen predicted the minicomputer industry will soon follow the pattern micro vendors experienced, in which those vendors saw their overcrowded ranks thinned drastically largely due to plummeting demand and bloodletting price wars.

"Even if it was 500 [micro vendors] down to 12, that's a major 1,000 change, and it's probably a thousand down to five," he said. "We're going through the same sort of change in many other areas; it's clear the world doesn't want a hundred different general ledger software systems."

One thing the world definitely does want, in Olsen's view, is networking. Corporate users need the means to link micros, minis, mainframes and communications, Olsen said, and the shortage of solutions is partly to blame for buyer hesitation in the current computer industry slump.

"DEC may have helped cause this computer depression," Olsen said, "because I finally convinced people that they need networking and that a bunch of independent computers won't really solve the problem. People, once they get a hint of what networking can do, are afraid to make a move."

DEC's challenge, Olsen said, is to convince users that the minicomputer pioneer can also be the networking solution vendor of the 1980s and beyond. He regales listeners with tales of DEC executives linking VAXs, Decmates, Microvaxs and workstations together over Ethernet but admits the technology will not sell itself. The company's No. 1 priority in 1985 is not to batten down using cost cuts to weather the slump, but to master the hard sell of networking, he said.

"Things people have been looking for, we've got, and no one else will have them for a while," Olsen said. "We've got a message to get across; it just takes time, it takes work. We're not doing too badly, considering the economy. Cutting back is not the challenge. People expect us to cut back, just because everyone else does. With everyone else cutting back, we should go the other way."

DEC is not out rescuing laid-off production line employees from Wang Laboratories, Inc. or Data General Corp., however. Olsen admitted that DEC has scaled back its manufacturing work force, attributing the drop to increasingly automated and streamlined production as well as to the industry slump.

The DEC sales force has grown, but Olsen stressed that all future staffing decisions, including one that would break from the DEC no-layoff tradition, will depend on the business climate.

"The nature of the whole business is [such that] we're always reshuffling things," he said. "Things change, so we have some products we're not making anymore and some we're not selling anymore. We never promised there will be no layoffs, but we see an increasing demand for our products, and the summer's going better than it went last summer. We feel our job is to get that [product] message out, so we're not planning any layoffs."

DEC's next moves on the networking chessboard will probably be on the microcomputer end. "I am not going to announce anything, but we obviously have to have small desktop Microvax workstations, and it's obvious which two we need," Olsen said. "We need one that has got a lot of industry software and one to keep what we have in word processing. . . . The Decmate we have, we still believe, is the best [for] word processing. We've got to integrate that for other things, but we're not quite ready to announce how we'll do that."

Any talk of the future of networking invariably evokes a long shadow emanating from Armonk, N.Y. — and most everyone not wearing blue pinstripes castigates IBM for aiding and abetting the confusion over standards. Olsen, whose suit bears a gray stripe, is obviously among them.

"I don't understand what [IBM is] doing, and I don't think [it has] told anybody completely what [it is] doing," he said. "If you look at what [IBM has] brought out, it's kind of a messy thing, all kinds of wires. I suspect [IBM is] going to go Ethernet because I don't think there's any other really nice way of doing it. That's my guess, I don't know; I shouldn't even say it publicly.

"When we picked Ethernet, we and a number of others tried to make it industry standard," Olsen continued. "Now, there are two companies [IBM and AT&T] that want to get a monopoly, so they didn't join in. I suspect that IBM will join into that, because I don't think [its] ever going to get [its system] to work. . . . Well, we'll see what happens."

Deflecting recent industry rumors, Olsen stressed that DEC is categorically not interested in reaching out and touching AT&T — in the form of a merger, that is. "We have no interest in the telephone business, and we would be of no value to them if we're not interested," he said. "There have been very few, if any, . . . high-technology unfriendly mergers that have worked out."

Olsen called DEC's recent decision to resume production of the Rainbow micro "absolutely unimportant," and denied any corporate frustration in the world of the IBM Personal Computer standard that DEC belatedly and begrudgingly accepted. "We made our mistakes that we shouldn't have made, but that's not frustrating, that's part of the computer business," he said.

"We'd probably be dead if we were that successful," Olsen added with a grin. "I'd hate to have that much production and have it disappear suddenly, too. We don't do well with too much success. You know, after many years of success, it's awfully hard to cover."

PROFESSIONALISM
IS A COMMITMENT
CERTIFICATION
IS THE
TEST
ICCP.

The Institute for Certification of Computer Professionals (ICCP) has scheduled the second 1985 examination for the Certificate in Data Processing (CDP) and Certificate in Computer Programming (CCP) for Saturday, Dec. 7, 1985, at test centers throughout the world.

The CDP Examination is designed for business-oriented DP practitioners at the management or supervisory level. The CCP Examination for experienced programmers is constructed so that each area of specialization—business, scientific, systems programming—includes five general computer programming sections and a sixth section in candidate's area.

Application deadline is Friday, Nov. 8, 1985 for December exams.

NOTICE

This is the last year you can sit for the CDP and CCP without recertifying. In 1986, successful candidates will be required to recertify every three years!

For a copy of either the CDP or CCP "1985 Examination Announcement and Application," check the appropriate box below. The brochure includes an Application, Test Site List, Exam Content and Codes of Ethics, Conduct and Good Practice.

☐ CDP ☐ CCP

Official Study Guides for both the CDP and CCP exams are available. Study Guides may be purchased directly from the ICCP, Executive Office, 2200 East Devon Ave., Suite 268, Des Plaines, IL 60018. Make checks payable to ICCP.

☐ CDP Study Guide

Maintenance programmers have long regarded themselves as members of an unsung, even downtrodden, minority. With the possible exception of operations personnel, no class of information systems professionals ranks lower on the MIS totem pole than the specialists who fix and modify existing software.

Compared with their colleagues who write programs from scratch, maintenance people have traditionally drawn lower salaries and have borne the brunt of departmental budget cuts. Their specialty has also typically been viewed as a mere springboard to applications development rather than as a skilled occupation with its own inherent value. Even the word "maintenance" conjures up images of a blue-collar work force engaged in menial labor, according to Joe Podolsky, Hewlett-Packard Co.'s manager of quality information systems.

For years, maintenance programmers have accepted their lot in life with quiet resignation. But lately, a new assertiveness has begun to emerge among the MIS field's "second-class" citizens. Today, maintenance programmers are demanding the professional respect and recognition they feel they have always deserved but have seldom received.

This mood of rising activism manifested itself at a recent meeting in San Francisco of the Software Maintenance Association (SMA), a new organization that aims to promote the interests of the field and its practitioners. The gathering marked the debut of the nationwide association's Northern California chapter.

During an organizational meeting that lasted roughly two hours, more than 40 attendees discussed a broad range of maintenance-related problems, including their field's widespread disrepute. Virtually no one in the crowd disputed the contention that systems managers and applications developers hold maintenance programmers in low esteem and treat them accordingly.

In the eyes of many of their systems coworkers, maintenance lacks the glamour that is usually associated with applications development, Podolsky said during an interview. Like operations personnel, maintenance programmers daily confront the "real-world messiness" from which their counterparts in development are often insulated.

But Podolsky, who spoke briefly at the SMA meeting, rejected the stereotypical image of maintenance programmers as information systems grunts who necessarily play second fiddle to applications developers. On the contrary, he said, "if I were forced to choose between development people and maintenance people, I think I'd probably choose maintenance people, because in most cases they are the guts of a company."

In its own way, maintenance demands as much technical skill as does development. For one thing, maintenance specialists need to be accomplished detectives merely to pinpoint a software problem in the first place.

Then, they have to be able to "remodel a program in the style of the original architecture so that they are not causing more problems for future programmers," Podolsky said. "That's a challenging task. One of the problems that is almost a legend in software is that once it has been maintained by dozens of people over the years, the code itself becomes virtually unmaintainable."

But technical know-how by itself is insufficient to make a maintenance programmer effective. Maintenance requires at least as much knowledge of business and interpersonal communications as it does of pure programming. "Not only do maintenance people have to fix software itself, but they also have to understand how their organization changes, how software should be adapted and how they should consult their users," Podolsky said.

Because their jobs frequently require them to serve as user advisers, Podolsky prefers to label maintenance programmers as "software support specialist" rather than with their usual job titles.

Podolsky's zeal for maintenance programming apparently typifies the views of many of his peers. "There's certainly more talk these days about software maintenance in a constructive sense than I've seen in the 25 years that I've been in the business," he said.

As evidence of maintenance's growing prestige, Podolsky pointed to recent developments such as the formation of the SMA. The association's mere existence, he said, reflects a growing determination on the part of maintenance programmers to clarify their role for other DP workers, to boost their image and visibility and to improve their own sense of professional self-worth.

A special target of the maintenance field's consciousness-raising efforts is MIS management, which should view the discipline "not as a mechanical process but as the adaptation of a living organism, software, to the real world," Podolsky said.

If a firm's maintenance programmers are discontented, he added, its MIS director will have problems with a group that accounts for half of departmental expenses and that plays a crucial role in determining whether a system succeeds or fails.

SYSOUT Management Made Easy With $AVRS

UNTIL NOW there has not been an integrated approach to the management and archival of SYSOUT and SYSLOG. $AVRS, from Software Engineering of America, solves this problem by completely automating the management and storage of this critical JES output.

$AVRS features and benefits:

- ☑ savings in printer and paper costs
- ☑ savings in personnel costs
- ☑ comprehensive production and test JCL error checking
- ☑ immediate access to JCL of failing jobs through any terminal
- ☑ complete ISPF-like interactive and batch retrieval facilities
- ☑ ability to produce statistical analysis of SYSOUT using $AVRS commands
- ☑ archival and retrieval of SYSOUT by class, name, time, etc.
- ☑ increased data center security

NOW AT OVER [illegible] INSTALLATIONS

$AVRS is saving thousands of dollars daily at over ~~280~~ data centers by providing efficient and cost effective management and archival of SYSOUT and SYSLOG.

To obtain further information on how
$AVRS can benefit your installation, call
SOFTWARE ENGINEERING OF AMERICA at [212] 206-7660
150 Fifth Avenue, New York, NY 10011.

Graphics users prefer transparencies to slides

By Edward Warner
CW Staff

BOSTON — Business graphics users surveyed by *Computerworld* on the floor of the Computer Graphics '85 East conference here last week overwhelmingly preferred to use overhead transparencies rather than slides for business presentations.

Nationwide, the question of whether to use transparencies or slides for business presentations is coming to the fore as computer graphics becomes the dominant means of producing graphs and charts. The cost of slide film recorders is falling, but slides are still limited by technology — they cannot be used in well-lit rooms, for example — and they buck tradition in many firms.

The corporate tradition at Avco Systems Division, a subsidiary of Textron, Inc. in Wilmington, Mass., is to use transparencies, as many as 2,000 a month, according to information center consultant Elizabeth Deware. The company, she said, prefers transparencies for their ease of use and because it has very few slide projectors on site.

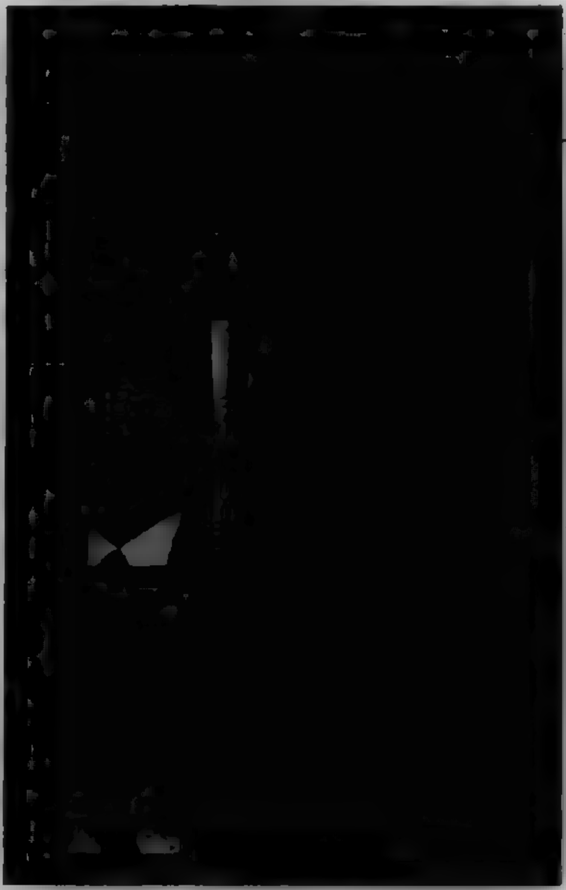
At a General Motors Corp. manufacturing plant in Shreveport, La., cost was the deciding factor in favor of overheads, according to H.S. Robbins, a cost analyst there. The facility, he said, produces 100 to 200 overheads per month, at a cost of about $1 each.

Cost is not the main reason why the U.S. Department of Energy (DOE) office in Albuquerque, N.M., prefers transparencies to slides, according to David Begley, a systems analyst there. Bagley said the DOE wanted speed and volume production, both of which he said it gained by using overheads.

> ”
>
> *The cost of slide film recorders is falling, but slides are still limited by technology — they cannot be used in well-lit rooms, for example — and they buck tradition in many firms.*

Ease of use led Zellweger Uster, Inc., a Charlotte, N.C., computer maker, to prefer transparencies to slides. According to Lenny Furlough, manager of product development, the firm produces 20 to 50 transparencies a month for in-house presentations. Acknowledging that slide technology is becoming less expensive, Furlough said he is giving it a second look.

Of those interviewed, only Paul Holzwarth, audio visual manager for State Mutual Life Assurance Co. of America in Worcester, Mass., said his employer preferred slides to transparencies. State Mutual produces about 7,500 slides annually, he said, using an Autographics computer graphics workstation. Holzwarth said that slides remain in use at State Mutual because they have become a traditional part of a business presentation. Managers, he added, said there is a quality advantage in slides.



Report to eye terminal issues

New technologies have dramatically changed traditional data communications terminals.

The *Computerworld* October Special Report on data communications terminals will examine some of these new terminal technologies, specifically high-resolution color graphics terminals and terminals with integrated voice/data telecommunications options.

Articles for submission to the report should take one of the two following forms:

- A tutorial article discussing an issue or a trend.
- An application story outlining a particular user's experience with data communications terminals.

The deadline for contributions is Aug. 30. Articles must be typed and double spaced and must range in length from three to five pages. Artwork such as charts, graphs and photos is encouraged.

If you have a story you would like to tell or an opinion you would like to express, contact Janet Fiderio, Special Reports Editor, *Computerworld*, Box 880, 375 Cochituate Road, Framingham, Mass. 01701.

Here's all you need to prepare for and pass the
CDP EXAM.
THE FIRST TIME!

Study privately and at your own pace — wherever you are! The [illegible] CDP cassette review course complies with the recommended guidelines of the ICCP for the CDP exam.

★ Data processing equipment
★ Principles of management
★ Computer programming and software
★ Accounting and quantitative methods
★ Systems analysis and design

The course includes 12 audio cassettes in a handsome binder, a 200-page study guide, and a booklet, "tips & techniques" on passing the CDP exam. Also included are 300 exam-type questions and answers for practice and confidence building.

WHAT TO LOOK FOR IN ON-SITE TRAINING

With all the technical training options around today, it's hard to figure out which company will offer the most professional, reliable on-site training. Here's Sys-Ed's checklist of key benefits that will make your training investment really pay off.

ARE THESE BENEFITS INCLUDED?	SYS-ED	OTHERS
● Qualified training consultant for needs analysis and skills inventory?	YES	NO
● Comprehensive, coordinated curricula of CICS, IMS, VSAM, TSO ISPF, MVS JCL, DOS/VSE, & VM?	YES	NO
● Complete range of training for the IBM environment, including IDMS, DATACOM, ADABAS and SNA?	YES	NO
● Ongoing technical support?	YES	NO
● Satisfaction guarantee?	YES	NO
● Additional charge for customized training?	NO	YES
● Thousands of solid references?	YOU BET	?

If you ask other training companies the answers to these tough questions, you'll probably make the decision thousands of decision-makers like yourself made: to get your training from The Computer Education Professionals at Sys-Ed.

Write SysEd or call (212) 564-9147/48/49 for more information about the range of on-site course options. By the way, we also offer public, regional and consortium courses.

______ Tell me about your on-site training.
______ I'd like a schedule of your public courses in my area.
✓ Be sure to let me know about the Sys-Ed Multi-Course Discount and your Satisfaction Guarantee!

Name ______ Company ______
Address ______ City/State/Zip ______

Nobody makes the science of management easier.

On-line crime suspect system implicated in false arrest

By Charles Babcock
CW New York Bureau

NEWARK, N.J. — A New Jersey woman was arrested, strip searched and jailed on the basis of inadequate information fed into a National Crime Information Center computer, according to a suit filed in U.S. District Court here.

The center is a national clearinghouse for information on suspected criminals. The system is maintained by the Federal Bureau of Investigation in Washington, D.C. A spokesman for the FBI said local police agencies are responsible for what information goes into the system and how it is used in making an arrest.

Elaine Smith of Dover, N.J., was held for eight days in the Morris County jail in July 1983 after a check with the National Crime Information Center indicated a woman with the same name and birth date was wanted in Texas for welfare fraud, said Smith's lawyer, Patrick C. English of Clifton, N.J. Smith had been stopped on a traffic violation, he said.

The target of the Texas search had a different middle name, social security number and physical description from that of the New Jersey Smith, but none of the information except the suspect's weight — 140 lb — had been included in the center's records, English said. His client weighed "less than 100 pounds" at the time of the arrest, he said.

According to English, Smith was arrested a second time and taken "screaming and hysterical" from her place of work by sheriff's deputies in August 1983 for another three-day stay in jail. She was released after it was established she was employed at her job at the time the welfare fraud was committed. The woman said she has never been to Texas, English said.

Classic computer misuse case

English, who has taken the case for the American Civil Liberties Union (ACLU), called it "a classic case of misuse of the computer. [The National Crime Information Center] doesn't have a system sophisticated enough to distinguish between common names."

"It is true of any technological advance. People start depending on the computer and consider it infallible," claimed Deborah H. Karpatkin, staff counsel of the ACLU.

Named as defendants in the suit are: Morris County, N.J., the city and county of Dallas and the state of Texas. The Morris County Prosecutor's office, which sent a representative to accompany sheriff's deputies on the second arrest, is defending the public agencies in the case, but the first assistant prosecutor, Karen Lee Barrett, declined to comment. Her office has not received copies of the suit, she said.

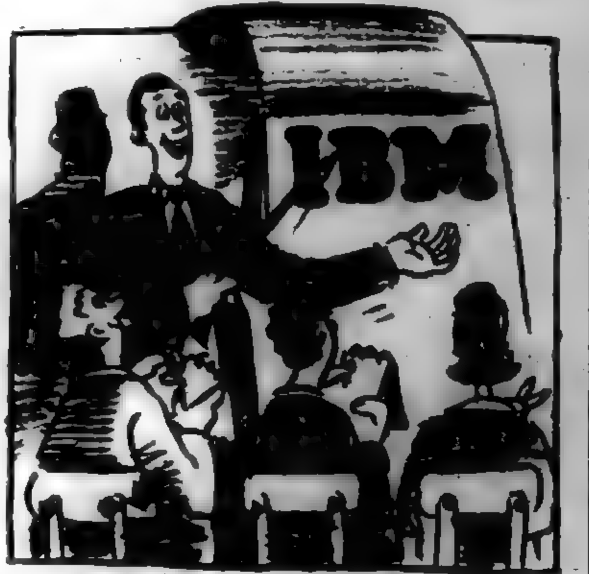
No Social Security number entered

English said he has obtained the documents governing procedures at the National Crime Information Center system. He said it calls for a Social Security number to be entered for each suspect, but none was provided in the Smith case.

The National Crime Information Center uses an IBM 3033 Model S with 12M bytes of memory and a dedicated backup to maintain around-the-clock, on-line files of criminal suspects. About 16,000 law enforcement agencies use the system, accessing it through terminals placed in their offices or at a central law enforcement agency, said a center spokesman.

The center's operating manual, provided to local police agencies, states that finding a "hit," or the name of the party a policeman has stopped in the center's system, "is not probable cause for arrest. A hit is one fact that must be added to others," the center spokesman said.

The suit does not list the amount of the damages sought. New Jersey law requires damages to be left out of the case until it has been heard.



Learn how to manage end-user computing... from the people who know how to manage.

Chances are, end-user computing has brought new management challenges to your company. That's why IBM is offering classes that deal with issues such as: Which applications are best for your end users? What companywide strategies should be implemented to deal with personal computing? How can your return on investment be measured?

To learn management approaches that deal with these issues and more, consider attending the following courses at the IBM Information Systems Management Institute:

Information Center Management
—Course code W9948
Information Center Consulting
—Course code W9949
Managing Personal Computing
—Course code W9944
Planning for Office Systems
—Course code W9920
Project Planning & Control for Users
—Course code W9896

For 19 years the IBM Information Systems Management Institute has offered low-cost classroom courses to help customers increase the productivity of their information systems.

The Institute's 36 courses are grouped into six areas considered to be critical success factors for I/S operations: Information Systems Planning; Application Development; Service Management; Information Asset Protection; End-User and Personal Computing; and Professional and Management Development.

Experienced instructors teach the same techniques that IBM itself uses. What's more, classes are conveniently offered in over 20 cities.

To help you find out more about the Institute's curriculum, and each specific course, we have recorded complete descriptions on audiotape.

To listen to these tapes, to order a course catalog, or to enroll—call the number below.

Software/Expo scheduled for Sept. 17-19

DALLAS — The sixth annual Software/Expo will be held Sept. 17-19 at Infomart here.

Topics to be covered in early conference sessions include the micro-to-mainframe link, software development, project management, graphics, expert systems and micro-based decision support. Later sessions will cover subjects including prototyping, micro uses in business, automated applications development tools, fourth-generation languages, the future of AT&T Unix and strategies for success in the information center.

Thomas M. Nies, chief executive officer of Cincom Systems, Inc. will deliver the keynote address Sept. 17.

Registration fees are $325 for the full conference and $110 for each single day. On-site fees are $50 extra for the full show and $20 for a single day.

More information is available from Software/Expo, Suite 205, 2400 E. Devon Ave., Des Plaines, Ill. 60018.

USPS plans bigger rate discount for nine-digit Zip users

Savings of 1 cent per item expected

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — The U.S. Postal Service (USPS) plans to increase the financial incentive for using nine-digit Zip codes, a move that may prompt hundreds of businesses to convert their computerized mailing lists to the Zip + 4 system.

Today, only about 600 of the nation's biggest mailers use nine-digit Zip codes, but a bigger postal rate discount may increase that figure to 6,000 users, according to James Pehta, vice-president of List Processing Co. (LPC), a software vendor in Glen Ellyn, Ill.

Pehta is also a member of the Mailers Technical Advisory Committee to the Postmaster General.

> *The USPS announcement sends the market a signal that the USPS is firmly committed to Zip + 4.*
>
> — **Ronald F. Friedman**
> **Group 1 Software**

In an effort to entice more converts, Postmaster General Paul N. Carlin announced Aug. 8 that the USPS would urge the independent Postal Rate Commission to increase rate incentives for presorted business mail using the nine-digit Zip codes. The present discount is one-half cent per piece.

Although Carlin did not state the amount of the proposed discount, USPS commissioners and industry observers expect the discount to be doubled to about 1 cent per piece.

Could be available by April

Assuming the USPS proposal gets expedited treatment at the Postal Rate Commission, the larger discount could be available by April 1986, Pehta said.

Ronald F. Friedman, vice-president of sales and marketing for Group 1 Software, a division of Computer Network Corp. in Washington, D.C., said the USPS announcement is important because it sends the market a signal that the USPS is firmly committed to Zip + 4.

He said many business mailers had been reluctant to convert because of the apparent ambivalence of USPS management toward the program.

Friedman said the predicted rush of new customers will be a boon for software vendors such as Group 1 and LPC, the dominant vendors in the market, as well as for dozens of service bureaus that use the software to provide conversion services.

The turnkey software packages typically read a company's mailing list — with five-digit Zip codes — and assign each address a nine-digit Zip code from the USPS directory.

Complementary software products can also clean up the mailing list by identifying duplicate and inaccurate addresses.

Attract certain businesses

Pehta and Friedman agreed that the bigger discount will attract businesses with medium-size mailing volumes because the discount will make the payback on conversion investment more attractive, perhaps less than one year for certain firms.

For business mailers, the advantages of Zip + 4 include the USPS discount, targeted delivery and the cleansing effects of the conversion process. For the USPS, Zip + 4 helps to reduce the high labor costs of mail sorting.

In the future, the USPS hopes to have equipment that can read the nine-digit Zip code and then print a bar code on the envelope that can be read by automated sorting machines at destination post offices.

Looking for IMS Productivity Tools?

Take a close look at APS/IMS...
APS/IMS is the application productivity system that for the first time, offers a strategic solution for IMS DB/DC and CICS/DL1 users.

With APS/IMS, you won't have to settle for a development tool that meets just a few of your productivity requirements. APS/IMS incorporates screen and application "painting," prototyping capabilities, and procedural and macro language support into a single, integrated architecture. With APS/IMS, your development staff can design, prototype and implement batch and online applications in a fraction of the traditional time and cost — without sacrificing performance or functionality.

And APS/IMS won't force your development staff to learn a new language or adopt a new design methodology. APS/IMS is fully compatible with your existing source-level interfaces and generates native-level COBOL source code, without adding any run-time overhead.

...via the "FAST TRACK" Evaluation
Your time is important. That's why SAGE has developed an evaluation process that's quick and thorough. In 1-½ days, our "FAST TRACK" will give you an in-depth conceptual and technical overview of the APS/IMS product plus a "hands-on" workshop session. You'll meet with our technical support staff, product development managers and corporate executives to gain the complete product knowledge you need to make an informed decision.

So if timing is critical, schedule a "FAST TRACK" session. Just call 800-638-8703 and ask to speak to a "FAST TRACK" Representative.

YES, I am interested in APS/IMS.
☐ Timing is critical. Tell me about FAST TRACK.
☐ Please have a representative contact me.
☐ Please send me information.

U.S. lead in disk storage mart threatened by foreigners

Government action needed, report says

By [illegible]
CW Staff

WASHINGTON, D.C. — Foreign competition threatens to topple the U.S.' worldwide preeminence in the disk storage market, according to a government report on the state of the industry.

The U.S. government should establish tax benefits, set realistic export control policies and combat violations of U.S. patents and trademarks as part of a multipronged approach to rectifying the U.S.' slipping hold on the market, according to the U.S. Department of Commerce's report, "A Competitive Assessment of the U.S. Disk Storage Industry."

The study presents the results of an assessment of that industry undertaken by the Commerce Department's Office of Computers and Business Equipment/Science and Electronics. It was written by industry specialists after consultation with various Commerce Department agencies and representatives of industry trade associations, marketing research firms and individual companies in the U.S. and the Far East.

The disk storage industry can be stratified into high-, medium- and low-capacity segments by various parameters, including storage capacity, performance, price and technical complexity, the study said.

Foreign competition — especially from Japanese manufacturers — has been strongest in the market's low-capacity segment, which accounts for 25% of the market's value, the report said. The Japanese have devoted considerable effort to developing optical storage devices, which could lead to their preeminence in the potentially significant high-capacity market segment.

The chief U.S. opportunity lies in the fact that the largest and fastest growing market for storage is in the U.S. To retain their current domestic market share, U.S. firms must turn to automated design and production to ensure high quality and low costs, especially in the low- to medium-storage ranges. Many U.S. manufacturers have moved offshore to remain competitive through lower labor and component costs instead of through automation, the report said.

U.S. companies that manufacture storage devices overseas have inadvertently diffused storage technology knowledge to foreign entrepreneurs, the report said. As a result, countries such as Singapore, Taiwan and Korea have began to emerge as competitors to the U.S. industry.

If these foreign suppliers are successful in gaining a foothold in the low and medium markets, it is possible that they will ultimately challenge U.S. suppliers at increasingly higher levels of performance and for greater shares of the market's value.

> ”
>
> *To retain their current domestic market share, U.S. firms must turn to automated design and production to ensure high quality and low costs*

According to the report, a number of policy options arise from the following: the U.S. transfer of technology to foreign competitors, a shortage of engineering talent, the need to maintain leadership in innovation and product technology, the offshore movement of component and disk drive production and the need to automate production and design.

Incentives for the expansion of domestic production and job creation, including tax breaks and subsidies, could result in a slowdown of technology transfer and the movement of U.S. production offshore.

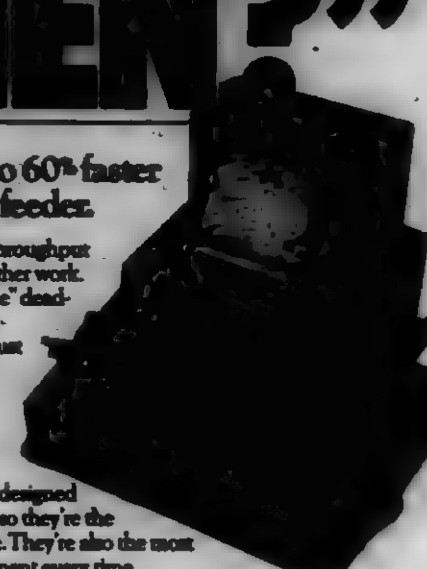
Other tacks the government could take in its effort to guide the course of U.S. industry include the following:

- Encourage research and development activities and increase joint university and private sector programs and private sector R&D consortia.
- Offer tax and other financial incentives to encourage automation of U.S. industry.
- Advocate efforts that lower foreign barriers to free trade and work with U.S. industry to explore other avenues where developing nations can promote domestic high-technology industries without imposing restrictions on U.S. suppliers and without damaging their own interests.
- Continue efforts to ensure that signatory nations adhere to international conventions on intellectual property rights. The government could step up efforts to combat violations of U.S. patents, trademarks and secrets, including the use of trade sanctions where necessary.
- Strike a balance between national security and commercial interest. This could include giving strong support to the Export Administration, which tries to promote better understanding of export control regulations and the licensing process and is establishing a data base on the foreign availability of disk drive products.
- Step up efforts to recruit small- to medium-size and new firms into export promotion programs and encourage the use of export trading companies as a means of penetrating foreign markets. It should also encourage greater dissemination of foreign market research to these firms.

The report — stock number 003-009-00461-6 — is available for $2.50 by writing to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

"YOU WANT IT BY WHEN?"

UP TO
$200 REBATE
On purchase of
Profeeder™ Series
Sheetfeeders when
purchased with Qume
Letter Perfect Printers.
Now until 10/15/85.



Print your work up to 60% faster with a Qume paper feeder.

Qume paper feeders shorten throughput time and free your operators for other work. So you can meet those "impossible" deadlines while actually *lowering* your printing costs. At a usage rate of just 50 sheets a day, our single-bin sheetfeeder pays for itself in less than a year. At higher output levels, it can save you as much as $2,000 annually!

Only Qume paper feeders are designed expressly for your Qume printer, so they're the easiest to interface, install and use. They're also the most reliable, with perfect paper alignment every time.

We have Profeeder™ single and double-bin sheetfeeders, forms tractors, and a forms guide/collector. Plus a free brochure to help you choose the right one for your needs. Ask for it at your printer dealer, or call (800) 223-2479. And start meeting your deadlines with time to spare!

370 computer companies have discovered the secret to building some of the world's most advanced printers.

WORLD DIGEST

CW International News Network

TOKYO — Three companies of Sanyo Electric Group — Sanyo Electric, Tokyo Sanyo Electric and Sanyo Electric Trade — along with U.S.-based Icon Systems and Software, recently announced plans to co-develop and market a 32-bit supermicrocomputer. The companies, working together since December 1984, have drawn up the blueprints for the MPS 020-2 model supermicrocomputer. Based on Icon's design concept, the MPS 020-2 features two Motorola, Inc. 68020 microprocessors, processing speeds up to 3 million instructions per second (Mips) and the ability to connect 32 terminals.

Software will run under the AT&T Unix and MS-DOS operating system and will also support IBM 370-era machines. The system is slated for November production and will be manufactured by Tokyo Sanyo Electric, according to the vendor. The MPS 020-2 will cost less than $20,000.

Also being developed is a workstation for the MPS 020 that features a 1,024- by 1,024-pixel monochrome display and graphics processor. Future plans include a 5-Mips Unix machine to support three 32-bit microputers slated for release in 1986 and a 64-Mips machine, capable of linking 32 32-bit systems in 1987.

SYDNEY — The Queensland government's plan to establish its comprehensive Q-Net communications network have upset Telecom Australia, the national government's telecommunications authority. Telecom is worried that a monopoly-breaking precedent could be established because Q-Net will be linked to the public switched telephone network and will effectively become a value-added net operated by the Queensland government. Although Telecom policy allows a common-interest business group to interconnect public net traffic through its private network and then reenter the public net, it does not take the view that departments of a state government have a common interest.

BEIJING — The U.S. Commerce Department announced plans to bring a U.S. consortium of companies here this fall for a conference on telecommunications technology. The Sino-American Conference on the Application of Telecommunications Technology will be held Oct, 28 to Nov. 1. U.S. participants include IBM, AT&T, ITT and RCA Corp.

LONDON — Personal computer users here will face heavy fines or imprisonment if they fail to comply with new legislation governing software copying. A bill passed by Parliament last month makes the copying of software programs, outside the terms of the license agreement, a criminal offense. The act goes into effect on Sept. 15. While the legislation is deemed a step in the right direction, Ian Fraser, chairman of the IBM Personal Computer users group, doesn't think the bill will prove much of a deterrent. "It may make people think twice," he noted, "but when departmental budgets run out, there's a big temptation to use what you've got."

SYDNEY — A government subsidized training program for the unemployed has failed to attract applicants because of a lack of publicity. The scheme, which was the brainchild of the Australian Computer Society, is operated by the society with the assistance of the New South Wales and the Australian national governments.

The program finds and subsidizes employers to take on unemployed people interested in becoming computer programmers. But, according to the scheme's originator, Ormonde Browne, prospective employer-sponsors outnumbered applicants by a staggering 25:1 ratio. The program, which involves an eight-week intensive course, has trained 300 programmers in its five years of operation.

LONDON — IBM Personal Computer ATs are now available off the shelf here, but the British feel like they are getting the machines U.S. buyers do not want. Insiders reported the initial surge of demand in the U.S. for IBM's high-performance AT has not been sustained, and many dealers are having to discount their machines. The Personal Computer XT, on the other hand, is enjoying renewed popularity as buyers find it a much better value than the higher priced AT. The AT glut is being partially attributed to a widespread slump in the industry and to incompatibilities between the AT and other IBM Personal Computers. Some dealers, on the other hand, view it as a general leveling out after initial panic ordering. Therefore, the unwanted machines are finding their way to UK dealers, who are complaining that one out of five of the machines comes with a U.S. power supply.

LONDON — More than 80% of personal computer users feel they are not getting maximum benefit out of their machines, according to a survey just published by Manpower Ltd., a market research firm based here. Users indicated a need for more and better training on their machines. The survey also revealed that, of the 600 people interviewed, only 27% have exclusive use of their Personal Computers, while another 24% said they shared the machine with their secretaries. Some 35% of the respondents said they used IBM Personal Computers, which proved the favorite in industries such as oil, finance and utilities. The report is the first in a series of quarterly surveys to be published by Manpower, at Manpower House, 270-272 High St., Slough, UK.

Directories List 32,000 D P Users

Each directory of computer installations lists 16,000 computer users covering the NY Metro Area (NY, NJ & CT), and the Mid-Atlantic States (PA, VA, MD, DC, WV & DE).
Each site includes a profile of the hardware installed, software installed, (languages, databases, etc.), consultants used, future plans, applications and DP executives' names, titles, and phone numbers. An index provides quick access to 133 cross references by hardware, software and industry. Price: NY-$370 and MA-$370. Call (212) 683-0606. Computer Management Research, Inc, 20 Waterside Plaza, NY, NY 10010.

VAX
Financial Software
COLLIER JACKSON, INC.
We bring software to life
813-872-9990
3707 West Cherry Street, Tampa, Florida 33607

Get an IBM computer by Sept. 30 and save up to $16,500 on software.

There are a lot of good reasons to buy an IBM System/36 (5360 and 5362), IBM System/38 or the IBM 4361. Now there's a good reason to buy one quickly.

If you install any of these IBM computers or upgrade an IBM 4321 or IBM 4331 to a 4361 before September 30th, you can purchase up to $50,000 of selected IBM software at a 33% discount off the suggested retail price. So you can save as much as $16,500.

Whatever your business, an IBM Computer System can help you do what you do, better. To have an IBM Marketing Representative contact you about this offer, call IBM Direct at 1 800 IBM-2468, ext. 90, LU.

EDITORIAL

Forging better links

Industry leader John Cullinane came up with a new twist to an old joke when he was recently asked what his data base management software customers were asking for these days: "Three things — integration, integration, integration." Although Cullinane was addressing a particular software application, it is a fact that integration is now a byword in the computer industry.

Attention to product and application integration by disparate vendors would clearly serve users handsomely and go a long way toward rescuing elements of the computer industry from impending insolvency. For example, a June 1985 *Business Week*-Louis Harris poll asked DP managers at 600 leading U.S. corporations to explain recent cutbacks in computer-related purchases. Fifty percent of the sample said that companies have acquired so much equipment that they cannot digest what they have, and available hardware has outstripped the networking capability to use it fully.

This evidence sounds a single theme, a lament that organizations have too many computer products that do not work together efficiently. Before DP managers invest in additional equipment, vendors must offer more integration. Most of this integration must, given the reality of the workplace and the marketplace, involve products and applications relating to the IBM Personal Computer. Although many manufacturers have been scrambling for IBM compatibility for years, it is especially heartening to see such firms as Digital Equipment Corp. and Wang Laboratories, Inc., which have fought that trend, increase their links to the Personal Computer.

It was just three weeks ago that DEC offered VAX terminal emulation for the IBM Personal Computer — it was previously available only through third parties — and Wang announced products allowing the Personal Computer to run its word processing software and link its VS minis to the Personal Computer.

These are encouraging signs of a trend that can do nothing but benefit users and one that vendors should continue to pursue with all deliberate speed.

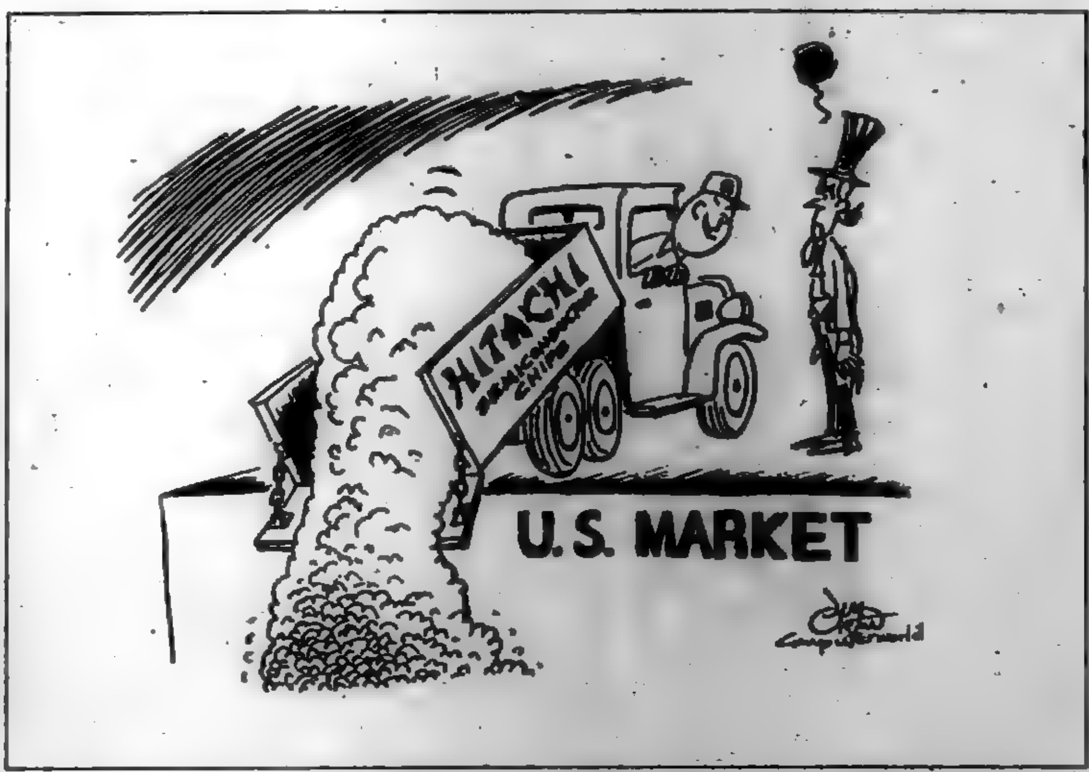
Different strokes

A little more than a year ago at a major trade show, one of Apple Computer, Inc.'s young marketing evangelists hunkered down over a cup of coffee, cast an eye over the field of competitors and pronounced, "Take it from me, Compaq Computer Corp. will be bankrupt by this time next year."

For the record, two weeks ago Compaq checked in with second-quarter profits five times larger than those of a year earlier, making it one of the very few micro companies to register substantial financial gains in the past year. Last we heard from Apple, it was undergoing the latest upper management reorganization. Or was it the latest work force reduction?

Compaq has always been run like a major manufacturing business, an organization that was once described as "a Fortune 500 company waiting to happen." Industry insiders say to expect that to happen by the end of this year. Meanwhile Apple, which has too frequently been run like a religious cult waiting to happen, retains its Fortune 500 status through dint of its early market leadership.

Accordingly, we take our hats off to Compaq while keeping our fingers crossed for Apple.



"Instead of "dump truck," honorable Uncle, please call it "enhanced-efficiency-of-delivery vehicle."

LETTERS

Hacker coverage propagates myth

In the article, "All-star teen hacker's team beat hundreds of systems," [CW, July 8], *Computerworld*'s acceptance of the published bragging of Bill Landreth, a high school dropout hacker, is an interesting phenomenon.

Not only have you given his book a rave review, but your staff writer gave credibility to this juvenile's vaunting by saying that he was an "all-star" and a "major league hacker" and that he accessed "800 computer systems" by presenting them as facts.

Your flattering coverage of a convicted teenage hacker and his book propagates the myth that outside hackers are the greatest threat to computer security.

This, despite the fact that two authoritative studies [CW, June 10 and July 1] have ascertained that insiders are the greatest threat to computer security and not outside hackers.

VIEWPOINT

Management sets tone for project success

THE DATA CENTER
John P. Murray

Information systems development projects usually succeed or fail because of department-level management. It must be firm from the first day of the project cycle, and it must remain firm throughout the project.

How can a project's success or failure be judged? The project should not exceed the allocated funding, it must be completed by the original deadline, and it must deliver what was promised.

The information processing department may be organized so that the requirements for systems success are in place. These include a formal project management system, the use of structured programming and design, peer reviews and a careful testing regimen prior to operational turnover.

Senior management may have a strong interest in the project. Adequate systems and programming staffs may be available. Sufficient test time, with an assurance of a high priority from the data center manager, may be assured. Yet without a true commitment from the DP department management, there is no assurance of success.

For example, consider this common situation: The person leading the information processing portion of the project walks into the office of the department manager and announces that the project, which has been under way for eight months and was scheduled to take 15 months, is two months behind schedule. One week before, during the monthly staff review of project status, this project had been reported as being "essentially on schedule." The department manager now faces a predicament.

Judged by the criteria already cited, this project has failed unless it can somehow be brought back on schedule. If the current assessment is correct, and if nothing is done, the project will take not 15 but 17 months to complete.

> *Deadlines will not be met unless all involved know that department management expects them to be met. If games are played — such as saying a project is on schedule when in fact it is not — then managers are only encouraging undesirable behavior.*

If additional staff is assigned to complete it within the deadline, the cost of the project will increase. The only hope is to find some method that will end the project on time and within budget without any sacrifice in required results. Considering the current situation, success appears unlikely.

The correct response may be to fire the DP project leader, not for allowing the project to fall behind schedule but for failing to present a factual assessment of its status. Although such draconian action may be justified, it is seldom taken. The usual reality is that the project leader is not dismissed and not even chided.

In fact, such a situation may elicit sympathetic understanding from the department manager. "Yes, I understand, these projects are difficult to manage. No problem, we'll just adjust the schedule by setting a new, let's call it the 'revised,' schedule date. When do you think the project will be finished?"

The answer may be, "Well, gee, that's hard to say, we do have a lot of problems. Why don't you give me a couple of weeks, let me see where we are at that time, and maybe I can give you a better idea." Deadlines will not be met unless all involved know that department management expects them to be met. If games are played — such as saying a project is on schedule when in fact it is not — then managers are only encouraging undesirable behavior.

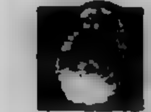
Allowing such occurrences to develop with apparent impunity sends a signal to the rest of the staff that a lower than agreed on standard of performance will be tolerated. If poor performance is condoned, after a time most of the performance in the department will be poor.

Human nature being what it is, it will not take people very long to realize that failing to meet deadlines will not bring retaliation, or if it does, that retaliation will probably not be harsh. Once that becomes evident, it will be increasingly difficult to enforce project deadlines. At this juncture, deadlines become targets rather than deadlines.

The track record on information processing projects can be improved in any organization. Doing so requires considerable time, effort and attention at all levels. Many new methods and procedures may have to be instituted to make progress. But, unless the manager of the department is willing to exercise firm control and to demand a consistently high level of performance, actual progress will be difficult, if not impossible.

Murray is director of management and information services for American Breeders Service, a DeForest, Wis., division of W. R. Grace & Co. and is the author of Management Information Systems as a Corporate Resource.

Entering the bedazzling bastion of bits and bytes



HUMAN CONNECTION
Jack Stone

The plain truth is that in spite of the enormous strides made in recent years toward simplifying user interfaces, today's computer machinery — be it micro, mini or macro — is still too formidable for many business people.

Aside from the technical intimidation, business users say they feel that the payoff is too meager when compared with the effort exerted in the tedious, often frustrating, learning process.

In my last column, I introduced the views of one data center manager who is developing a scheme for bringing the hard-core computer illiterates — estimated to be 90% of the population, according to one recent survey — into the bedazzling bastion of bits and bytes. Here are more of his thoughts on the matter:

"However hard-working, dedicated and intelligent the novice users may be, learning the productivity systems that run on the smallest of our machines is a bear. What is particularly discouraging is their difficulty in visualizing how the systems will help them achieve personal goals, other than having some data processing experience that embellishes their resumes or merely looking good to their managers.

"To be effective, initial training has to be much more sophisticated than before. Instead of tossing out a jumble of system commands and keyboard procedures, we must figure out ways to relate the learning experience to personal needs. We must think beyond systems that are merely easy to use to those that really meet organizational requirements. Specifically, individuals must perceive systems to be as indispensible to them in their career development as their eyeglasses, fountain pens and briefcases.

"Notebook-class portables, like the Tandy [Corp.] TRS 100/200, offer interesting possibilities in this regard. The base hardware/software complement has the functionality, operational simplicity and reliability that are needed, at least as far as the manufacturer [Kyocera of Japan] went. Most desirable from a training point of view is the invisibility of the operating system and concurrent RAM [random-access memory] residency of programs and data files.

"Of course, one of its greatest virtues is its feather weight — 4 lb — truly making it a machine that can be toted around without fear of breaking some vertebrae — and thus always accessible. Furthermore, during recent months, in addition to providing impressive add-on hardware, the independent vendors have really gone to town with software enhancements aimed specifically at improving the productivity goals of the individual.

"Let me cite some examples. Traveling Software, Inc. [in Seattle] offers independent modules for managing appointments, calendar and travel expenses. For the sales folks, there is a package for handling sales data, and for the team leaders, there is one for project management.

"The firm even sells a relational data base management system that allows the linking of files and the creation of custom reports and screen displays, plus a built-in spreadsheet-like capability. Not bad considering that user-accessible RAM is limited to 29K bytes.

"Also impressive are the products of Chattanooga Systems [in Chattanooga, Tenn.]. They specialize in personal programs that typically occupy less than about 4K bytes of RAM and merchandise quite a collection on one cassette tape: a text formatter, a [26-by 99-cell] spreadsheet, a list manager, a sort, a calculator, a trip expense accountant — even a personalized letter generator.

"Where cassette storage is too cumbersome — in the majority of cases, to be sure — the industry is providing read-only memory in pop-in program cartridges. Where the applications truly require bulk storage, one can obtain battery-operated [3½-lb] disk drives that handle 200K-byte-plus minidiskettes.

"Most important, one independent [vendor] has come forth with a beautiful package for effecting the transition to the IBM Personal Computer from the noncompatible Kyocera. Instead of downsizing MS-DOS or its ilk to a notebook machine, Telecommuter software from Sigea Systems [in Weston, Mass.] has [expanded] Kyocera operating system features and provided a simple hookup to transfer files. In this way, business users find themselves in the Personal Computer environment without fuss or bother.

"Oh, I'm aware of the cost problem with these small machines, such as RAM that is about 30 times the cost of add-on RAM for our Personal Computers. On the other hand, because overall cost is low, particularly when compared with the cost and effectiveness of more conventional training, the idea is appealing."

Stone is a Washington, D.C.-based independent management consultant, educator and writer, specializing in DP human communications and personal development.

THE SAS®

Fourth Generation Software

Now there's one software solution for all your Information Center needs. One solution for all your applications, for all your mainframes, minicomputers, and microcomputers. One solution — the SAS System.

INFOTRON SYSTEMS

Hardware Roundup

By Tom Henkel CW Staff

A look at 212 systems from 28 vendors

For mainframe users, the past year was special. Like the rare times when all the planets are in alignment, most of the major mainframe makers participated in an event that happens roughly every four or five years — they made major enhancements to their top-end product lines.

As is tradition, IBM started the round of mainframe announcements by unveiling the long-awaited Sierra line — two systems called the 3090 Model 200 and Model 400. National Advanced Systems Corp., Burroughs Corp. and Honeywell, Inc. quickly followed suit by announcing the two-model AS/XL, the three-model A15 and the five-model DPS 90 product lines, respectively.

Sperry Corp. got into the act with enhancements to its 1100/90 series mainframes aimed at making those systems perform better in scientific environments. The three remaining domestic makers did not enhance their top-end products, however. Control Data Corp. rested on the laurels of its Cyber 180 series enhancements of a year earlier, and Amdahl Corp. stuck with the 5890. NCR Corp. also chose to keep its current top-end product line.

The superminicomputer marketplace of the past year was volatile, a combination of boom and bust. Slumping supermini sales and fallout from a massive buying trend over the past two years spawned a rash of corporate layoffs that hit even the most stalwart firms like Wang Laboratories, Inc. and Data General Corp. But before the slump in supermini sales put the damper on new product introductions, Digital Equipment Corp. and Prime Computer, Inc. unveiled top-end superminis — the VAX 8600 and the 9955, respectively.

It was the year of parallel processing — the concept of using multiple CPUs operating concurrently to equal, or in some cases surpass, the performance of larger mainframe processors. Parallel systems architecture, although by no means a new concept, became the preferred system design for several companies. Start-up Encore Computer Corp. unveiled its Multimax parallel system early this summer. Intel Corp. also this summer began deliveries of its IPSC hypercube system announced last September. And Perkin-Elmer Corp. beefed up its commitment to parallel processing by unveiling two high-end parallel systems — the 3260MPS and the 3230MPS.

> ”
>
> *It was the year of parallel processing — that is, using multiple CPUs operating concurrently to equal the performance of larger mainframe processors.*

Perhaps the underlying impact of activity in the mainframe and supermini markets was the continuation of an ongoing trend whereby the already blurred distinctions between classes of computer systems becomes more clouded each year.

For example, the high-end mainframes announced by IBM, Burroughs and Honeywell appear to tread on ground typically held by supercomputer vendors such as Cray Research, Inc. and CDC.

In response to the ever-evolving computer marketplace, this year's three-part Hardware Roundup is a little different.

This first installment, mainframes and superminis, remains for the most part in its usual format. But because of the growing number of superminicomputer-class processors, those that appear to have a specialized focus will appear in next week's issue.

Included in this group of specialized systems are transaction processing systems, such as those manufactured by Tandem Computers, Inc. and Stratus Computer, Inc., and superminicomputers that appear to be geared to scientific/engineering applications, artificial intelligence and so on. The determination of which systems would appear in this group is admittedly subjective, since many vendors claim their systems can function in either the commercial or the scientific environment. Also, for the first time, next week's installment of the Hardware Roundup will include information about supercomputers.

The final segment of the Hardware Roundup will focus on traditional 16-bit minicomputers and the new breed of so-called supermicrocomputers. It will also address, in a somewhat abbreviated fashion, traditional microcomputers. The intent of this section is to address those microprocessor-based systems that would most likely fit into a business environment, as opposed to a home setting.

Furthermore, *Computerworld* offers the usual provisos on relative performance and million instructions per second throughput ratings. These ratings are provided in an attempt to put the systems in the Hardware Roundup into perspective by offering approximations of their power.

These numbers are not intended to be used as a buyer's guide. Clearly, many factors can influence the actual performance a user will experience with a given computer system.

Finally, CW does not endorse any product listed in the Hardware Roundup.

[illegible]

THE BEST WAY TO KEEP YOUR COMMUNICATIONS FROM BEING TIED UP IS TO TIE THEM TOGETHER.

NETWORKING LINKS ALL YOUR VOICE AND DATA TERMINALS, WHEREVER THEY MAY BE. IT'S ONE OF MANY INTEGRATED FUNCTIONS OF AT&T SYSTEM 85 AND AT&T SYSTEM 75.

Everyone knows the old adage, "there's strength in numbers." That holds true only if the various elements, however numerous, are working together.

The Networking function of System 85 and System 75 from AT&T Information Systems unites all the elements of our business communications systems so everything works together. Whether you have offices spread throughout a building or throughout the country, they can all be linked productively into one network.

A NEW BUSINESS ASSET

A network should be looked at not simply as a communications tool, but as a business asset. Like any other asset your business holds, it too can be controlled and managed and made to work for you.

All our networks let you incorporate new applications, making your system more powerful than ever. And thanks to our integrated digital T-carrier interface, you can speed up and control the flow of not only voice, but data transmissions as well.

In a small area, like a campus, or even nationwide, look into our Distributed Communications System. With it, multiple systems serving up to 100,000 lines can function as one. It also offers extensive voice and data terminal transparency and attendant transparency, so attendants can control the entire system from one location.

Remote Groups let you extend System 85 capabilities to small locations via DS-1 facilities. Remote Modules serve larger locations, up to 2½ miles away, over fiber optics. Voice communications and data from host computers are transmitted with complete user transparency.

An Electronic Tandem Network can also be used to link locations anywhere in the country. Through a mix of analog, high-capacity digital, and public facilities, virtually any number of voice and data terminals can be connected.

CONTROL AND ECONOMY

Once you've linked your communications into one network, you'll have a host of powerful features working to increase productivity, reduce costs and give you more control over your communications. Automatic Route Selection, Automatic Alternate Routing, and Queuing choose the least expensive path for all network calls. And "Authorization Codes" grant calling privileges to appropriate employees.

With all your offices under the umbrella of one system, networking can help create another business asset—a single, consistent corporate identity for every branch of your organization.

INVESTMENT PROTECTION

System 85 and System 75 are designed according to the guidelines of Information Systems Architecture. This ensures that any upgrades or future generations of the system will be compatible with the current one. So your investment is protected.

There are over 350 ETN's and DCS's already in place. More than half of the *Fortune 500* companies have chosen private networks from AT&T Information Systems. Besides our features, function and investment protection, there's one more compelling reason why—our service.

Our systems are backed by the largest sales and service staff in the industry. Network support includes predesign, cutover coordination, post-cutover administration, and ongoing maintenance. Add to that a century of communications experience and leadership, and your decision is easy. Of all your alternatives, only one is the right choice—AT&T.

To find out more about the Networking capabilities of System 85 and System 75, call your AT&T Information Systems Account Executive or 1-800-247-1212.

AT&T
The right choice.

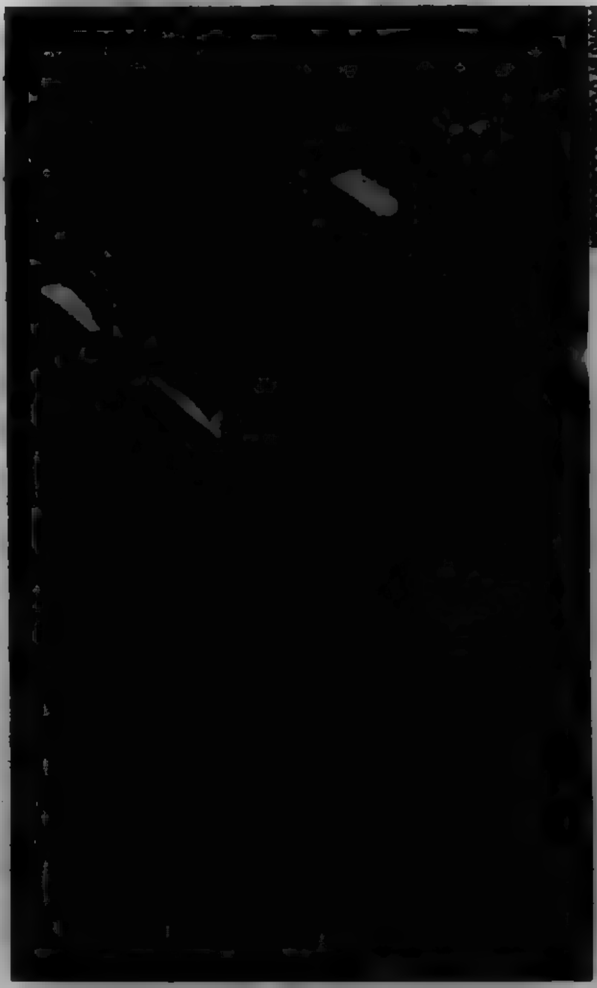
The science and art of debugging

By James H. Bradley



Debugging programs is the most scientific and systematic part of software work, provided the code is reasonably structured and economically documented. Because testing and debugging soak up about 25% of software development and maintenance costs — nearer 50% when maintenance costs are suballocated — systematic debugging is important.

Unfortunately, even the best books on testing regard debugging as a black art. In *Software System Testing and Quality Assurance* (Van Nostrand Reinhold, 1984), Boris Beizer suggests that "... debugging, so far, has not been amenable to theoretical treatment."

He adds, "Testing can and should be designed and scheduled beforehand. The procedures for, and duration of, debugging cannot be so constrained."

Beizer rightly says, "Debugging demands intuitive leaps, conjectures [the polite term is working hypotheses], experimentation, intelligence and freedom." Yet he contrasts debugging with testing, describing the latter as "predictable, dull, constrained, rigid and inhuman."

In my view, both testing and debugging are all these things. Debugging is a straightforward application of the scientific method that has been developed over 2,500 years. The basis of debugging is to locate a problem's source by binary partitioning, through working hypotheses that predict new values to be examined.

Take a simple, nonsoftware example: A lamp in my house does not work. If nothing in the house works, the cause must be in the main circuit breaker or outside; I look around to see whether the neighborhood is blacked out. If some things work, I plug the suspect lamp into a working socket and a working appliance into the suspect circuit. So goes the alternation of hypothesis and test.

Note that much of the testing uses substitution techniques; software designers call these techniques drivers and stubs. Software designed to be testable and debuggable has a judicious number of built-in drivers, stubs, trace features, counters and means for listing internal variables — all controlled by flags listed in the maintenance and support manuals. Often one of the stubs is the previous version of the code.

Possibly the bug may act up intermittently, or multiple bugs may be present. In this case, confirmatory evidence of these incidences is sought.

What is a bug, anyhow? Most alleged bugs are enhancements, errors and gaps in manuals or incorrect documentation. Errors in test plans are about as common as errors in code. Unsuitable numerical methods are often at fault.

I define a bug as a discrepancy between actual and expected system behavior, caused by a few local errors in a few lines of code or a few entries in a table. Redesign, research and development are not debugging. There must be documentation of the intended system behavior separate from its actual performance; otherwise, the system is lousy, not buggy. Ambiguous specifications and test plans are common; in counting people over age 60, for example, does everybody agree on how to count somebody who is between 60 and 61?

It is ironic that structured, rigorous specifications are so popular just when the market is booming in products that require less rigid specifications. Software for general sale, such as word processing tools, spreadsheets and data bases, is flexible and has many trade-offs, with minor effects on its marketability. Specifications are often given in general terms for responses to user and data errors, error checking of inputs, demands for confirmation of unusual inputs and backup code to handle supposedly impossible situations. Users shopping around for a commercial item or evaluating an existing product for a new application necessarily have both set and flexible requirements.

However, debugging requires documentation of the intended functions of code, even if somebody has made some variable, arbitrary choices. Systems have to be deloused before they can be debugged. Even in serious scientific computing, which oftens discards code after a single use and where rounding or discretization error and other perpetual problems cause incompletely predictable behavior, algorithms must be documented before they can be debugged.

Managers should note that bugs come in swarms, not singly. Check around: Much depends upon the programmer's mental state, which is profoundly affected by working conditions, noise, interruptions and excessive meetings. Where one bug is found, a whole nest is probably nearby.

Partitioning

Some bugs are hard to find because they can be intermittent (dependent upon concurrent uses of the system); insufficiently local, especially in certain types of artificial intelligence, multipass algorithms and feedback and feedforward loops; or dependent upon particular data values or upon the history of the inputs.

They can also be the result of unintended interactions and overwriting of values such as conflicting or invalid access to data; or even caused by hardware, compilers, loaders, operating systems or electrical interference. Even in these harder cases, the best method is usually partitioning through tests based on working hypotheses.

In practice, a batch run to dump a trace of execution and some intermediate values should normally record enough detail to partition the problem into four to eight pieces. In the interactive use of simple special stub code, binary partitioning is common because the mode of execution is set interactively via a few flags.

Aside from computers and accompanying peripherals, the following resources are needed in debugging:

- A test plan, discrepancy report or complaint.
- A test report or other supporting data.
- Data flow diagrams, state-transition diagrams, augmented transition networks, event analyses, detailed specifications and other structured documentation of intended system behavior. The test plan is too local a specification.
- Maintenance and support manuals showing all the nonpublic flags, trace, counters, dumps and internal interfaces as well as the basic structure chart.
- New and old listings of code and tables, with engineering change orders.
- Manuals for job control language, operating system, languages and other metafacilities.
- Suitable working space, good conditions and freedom from disturbances and interruptions.

Flow charts and program design language, if any, should be converted to the canonical form of sequence, loop and decision construct, even if the actual code is unstructured. That is how, in a radar system, I found an 18-year-old bug that had always been blamed on the weather. R. C. Tausworthe gives specific methods and examples of conversion in part one of his book, *Standardized Development of Computer Software* (California Institute of Technology, 1976). The delousing of unstructured and undocumented code starts with the preparation, in canonical form, of flow charts, then data flow diagrams and structure charts and then other structured documentation.

> ”
>
> ***Redesign, research and development are not debugging.***

Debugging is not a universal planned-response system; one does not automatically rerun the job with trace. Instead, one or more hypotheses are formed, based on data flow diagrams, event analyses or flow charts, to define what trace to print. Other steps include the following:

- Try to collect related values that may already be available. Trace the tree, or network, of causality both forward and backward. Predict indirect — backward then forward — consequences that can be examined — in the analogy of the lamp that doesn't work, check other appliances on other circuits.

Use an appropriately partitioned data flow diagram and event analysis as a tree of causality. Event analyses are used much like an expert system: Forward event analyses show what should respond in what way to each external, temporal or internal event; backward event analyses trace the circumstances and causes of each outgoing data or control flow.

- Trace the possible common origins of several known problems. Discard effects that are probably consequences of known errors/or treat them as supporting or refuting evidence. Correlate bugs that sometimes appear together, seeking the possibility of joint causes.
- Try bypasses, rearranging the input or providing information that was previously calculated. For example, some software treats trailing

FUJITSU
BAND PRINTERS
The Numbers are Right.

Now you can find the reliability, the quietness and the form factor you need in the new Fujitsu family of band printers. And with our M3040, M3041, M3042 and M3043 series, you have a choice of speed ranging from 300 LPM to 1200 LPM.

1200 *LPM is a Fast Band Printer.*

Each model delivers consistently crisp, high-quality characters at a speed that only a Fujitsu high-performance band printer can provide. High parts commonality is built right into every Fujitsu machine making service simple and quick. The Fujitsu band printers are surprisingly affordable and each sets a new standard in price/performance. For additional information, contact Fujitsu at 3055 Orchard Drive, San Jose, CA 95134, or give us a call. Our number is (408) 946-8777.

6000 *Hours MTBF is a Long Time without Failure.*

55 *Decibels is a Quiet Machine.*

42 27 35 *is the Size of our Compact Printers.*

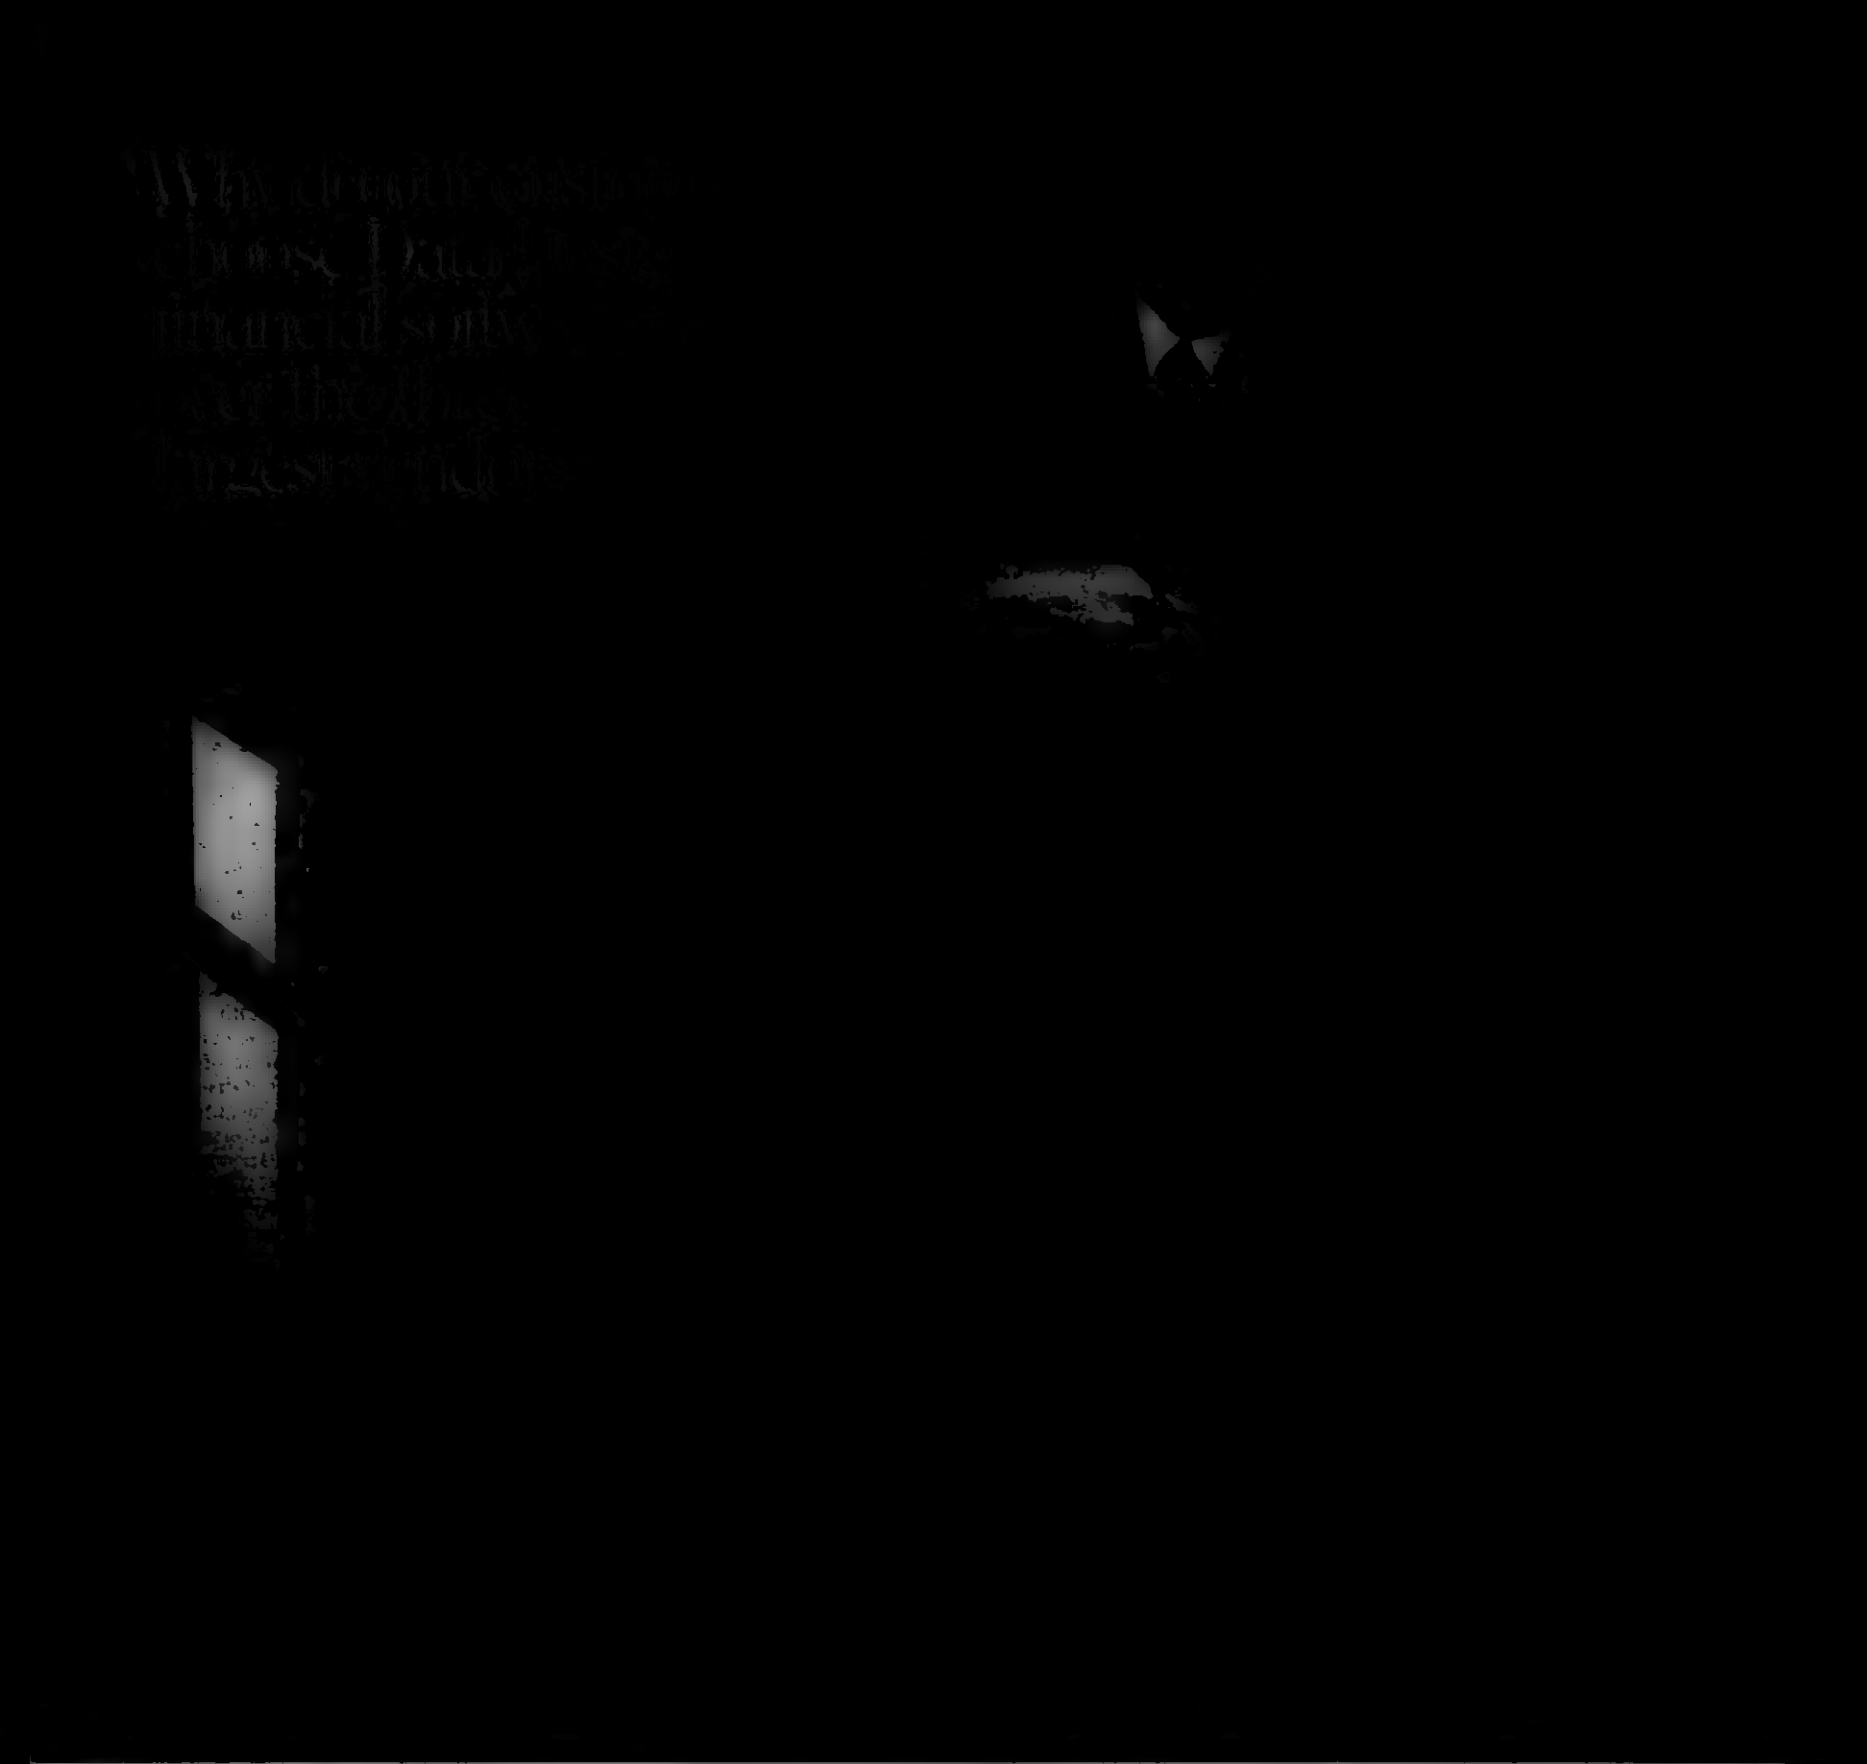
FUJITSU



Why do [illegible] choose Data Design financial software over the other largest vendors?

Because they did their homework. They talked to our customers and found out that for over 12 years, hundreds of Fortune 1000 companies have had exceptional results from financial software systems by Data Design.

They discovered what nationally recognized software surveys confirm year after year: that Data Design has an unsurpassed record of user satisfaction.

They learned they can expect fast, trouble-free implementation with our systems.

They were told that our systems are exceptionally flexible and easy to use.

They found out about our reputation for in-depth training and responsive, knowledgeable support.

They learned that Data Design places only management level people in customer service positions. People who average over 10 years experience—not trainees.

And more.

So, if you're in the process of doing *your* homework on mainframe financial software, call today for our complete customer list, and you too can hear why companies like Alcoa, Amdahl Corporation, Burger King, Estee Lauder, May Company Department Stores, Pillsbury, Sherwin Williams Company, Bankers Trust Company, Central Soya Company, Chicago Tribune, CIGNA Corporation, Federal Express, Litton, Midland Ross, Owens Corning Fiberglas, Perini Corporation, Royal Business Machines, G.D. Searle and Company, Security Pacific National Bank, Warner-Lambert Company, Zayre Corporation, Wisconsin Power & Light and hundreds of others decided on Data Design over other vendors.

And find out why 68% of our customers, who previously had other vendor's systems in place, have now decided to use systems by Data Design.

To learn more about the best financial software available, call toll-free **800-556-5511** or complete and mail the coupon today.

DATA DESIGN ASSOCIATES
Excellence in Financial Software.

blanks as zeros instead of an end-of-field; one can give a scaling value for a graph instead of calculating it from the data.

- Look for what was recently modified and recompiled. Possibly use the previous version of the code as the backup or one of the backup codes, depending upon the scope of the modifications.

Retesting a corrected bug can be rationally scoped from analyses of causality — the doctrine of 100% retesting after every change is an economically ruinous fantasy. Remote ripple effects are rare in structured, documented software. Check for overloads on communications links, data stores that may overflow and other critical constraints approaching saturation.

- Test around the boundary values if they are known: for example, those values that cause changes in logical decisions. Where boundary values are known — even if they are incorrectly implemented — one can often avoid stumbling into changes of logical state. Minor adaptations are needed for values that are the cumulation of inputs or other statistics; they cause the operation to be history-dependent.

- Force and read the values at interfaces — for instance, at each primary input. Define the range of values (possibly close to infinite) that produce erroneous results. A bug can be in a consistency check or auditing control rather than in the main computation, and in arithmetic of finite precision, it may be only the comparison that is wrong.

As part of testing, look for the numerical outputs normally to be smooth, continuous functions of the values of the inputs. This can be of some help in debugging. Examine the repeatability of bugs to look for particular data items, values and unintended interactions via languages, linkers and operating systems.

Real-time systems interacting with external hardware cannot normally rerun identical jobs; airline flights and missile launches cannot be scheduled for the convenience of maintenance programmers. Real factories and facilities may be unusable for testing because of safety and economy. (The maintenance programmer may be debugging the response of a safety system to malfunctions that must not be recreated.)

In such cases, and in many data processing applications, it is possible to spawn or create a separate task with dummy output files and recorded input files. Good supervisory control and data acquisition systems have one or more simulated modes of operation. For example, airlines and nuclear power facilities have large logging systems with files that are used primarily for postmortem problem analyses, including software bugs.

Testing and debugging

Existing textbooks talk only of deterministic testing, not of testing with any unpredictable or possibly predefined random or uncontrollable elements. Statistics go largely unmentioned. The theory and practice of the analysis of variance is absent. Consistency, not correctness, should be tested often; there should be at least as many people over 59 as over 60. Results predictions are often qualitative, semiquantitative or Boolean. Often the prediction is for no externally visible change in the state of the system (but, of course, normally the input is not totally ignored and is never scrutinized).

The textbooks also talk about testing by or on behalf of the organization that built or commissioned the software. Testing of commercial or existing products for acceptability in a new application has a lower degree of results predictability. Debugging such systems is more difficult, but the same methods work.

Testing requires special access to interfaces and theoretically unreachable backup code. Debugging should not require an additional access facility but may use special trace. Testing and debugging can often be partially combined, in that testing may generate output needed only if a bug is found. Backup code should be designed so that its automatic — unexpected — invocation preserves information about circumstances, states and relevant values, possibly including the invocation path. Debugging may require predictions of values that are not spelled out in the test plan and documentation.

Trace can be hierarchial (several levels), selective (several subtrees) or tabular (a list of modules, entrances and exits to be recorded). Good systems provide flags for selective execution of modules and a data assignment and retrieval facility running in apparent concurrency with the main job. In real-time, an apparently concurrent facility, such as an externally interactive system, is vital.

Debuggability design

Design for debuggability is related to, but not identical to, design for testability. In testing, a sequence of inputs relates more to internal states and outputs; internal states and memories may be viewed as outputs, while in debugging they must be viewed as outputs. Testing predicts certain consistency relations; debugging finds out why they are not obeyed. Testing may be concerned with coverage, but debugging is concerned only with coverage along the paths of intended or unintended causality.

A poor architecture is one in which data structures are identified by function. Each module should normally write into one (rarely two or three) data structure, with one module writing each structure.

This process may seem unnatural in systems with queues and stacks, and the structured analysis may or may not show the guardian access machines (which prevent invalid or conflicting access to stored data), but it is normally so. It may be especially unnatural in large data base systems, where one user may cause many files to be updated, but even there it is normally true at the module level.

Errors due to misuse of names or to overwriting are difficult to catch. One can, however, turn off the code that may be overwriting. Examine the data structures into which each module writes and from which it reads; good preprocessors have a list of the data structures into which each module is allowed to write.

A few data structures must be writable by many modules, chiefly via indivisible TEST and SET instructions for interlocks. Access may have to be masked via guardian access machines, as in airline data bases. In some cases one can use cyclic pickup, invocation of a transfer routine mapping between data stores or a triggering mechanism.

An understanding of mappings is facilitated if all data structures are shown as stored, even if little or no inherent nonconcurrency exists in the system; every data flow shown in the documentation becomes some variety of store in the electronics.

Debugging, a simple application of the oldest rules of the scientific method to software, includes the adequate definition of the software's intended operation as distinct from the actual implementation. In the future, software designed for testability and debuggability will have a major impact in the software market.

About the author

James Bradley is an independent consultant and teacher based in Atlantic Highlands, N.J. Bradley specializes in structured and numerical methods and support software applied to simulation. He is associate editor of the periodical Simulation.

Uptime

Provide 24 hour CICS access

CICS Dynamic File Allocation is a must for effective CICS scheduling. It is the gateway to non-stop, round-the-clock CICS systems. It eliminates batch update constraints. It guarantees bullet proof restarts. It allows you and your batch jobs to add and remove CICS files at will, without disrupting your user community. Site license $4,000.

Read JES Reports from CICS

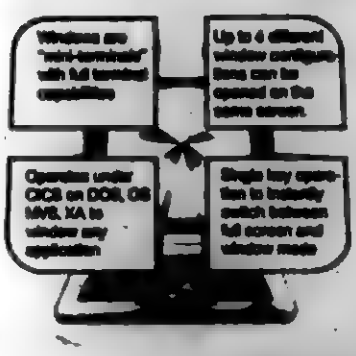
Give your CICS terminals and PCs access to JES reports. Let end users (1) browse time critical reports, (2) control report distribution, and (3) schedule and submit their own jobs. The CICS Queue Command Facility (CQCF) is an efficient, cost effective tool for previewing and controlling JES II reports. Site license $3,000.

Netec International, Inc.
P.O. Box 18538 • Dallas, TX 75218
214 324-3040 • Telex 88-4204

WINDOWS ON YOUR MAINFRAME TERMINAL

CICS–WINDOWS

SAVE YOUR HARDWARE $$$



Windows are "mini-terminals" with full terminal capabilities
Up to 4 different window configurations can be opened on the same screen.
Operates under CICS on DOS, OS MVS, XA to window any application
Single key operation to instantly switch between full screen and window mode

- Window facilities on every 327X terminal without any changes to your hardware or software
- Work with 2, 3, even 4 transactions simultaneously without losing valuable time switching back and forth between applications
- Increase productivity by having needed information instantly available on the same screen, including: other applications, menus, help screens, prior transactions, editors, notepads, etc.

IN DEPTH

The microcomputer and decision support

By Howard Morgan

The use of decision support system (DSS) tools has grown tremendously since the late 1970s, when microcomputing was introduced into the managerial world. DSS tools are more sophisticated and easier to use, and many managers now take advantage of them to perform complex analyses of portions of their business — an unheard-of event five years ago.

Yet with this growth have come problems: getting proper data for models; validating these models; integrating their use with standard corporate systems; and dealing with the issues of training, privacy and competition.

DSS are meant to be systems that support humans in making better decisions, not just systems that merely automate the decision-making function.

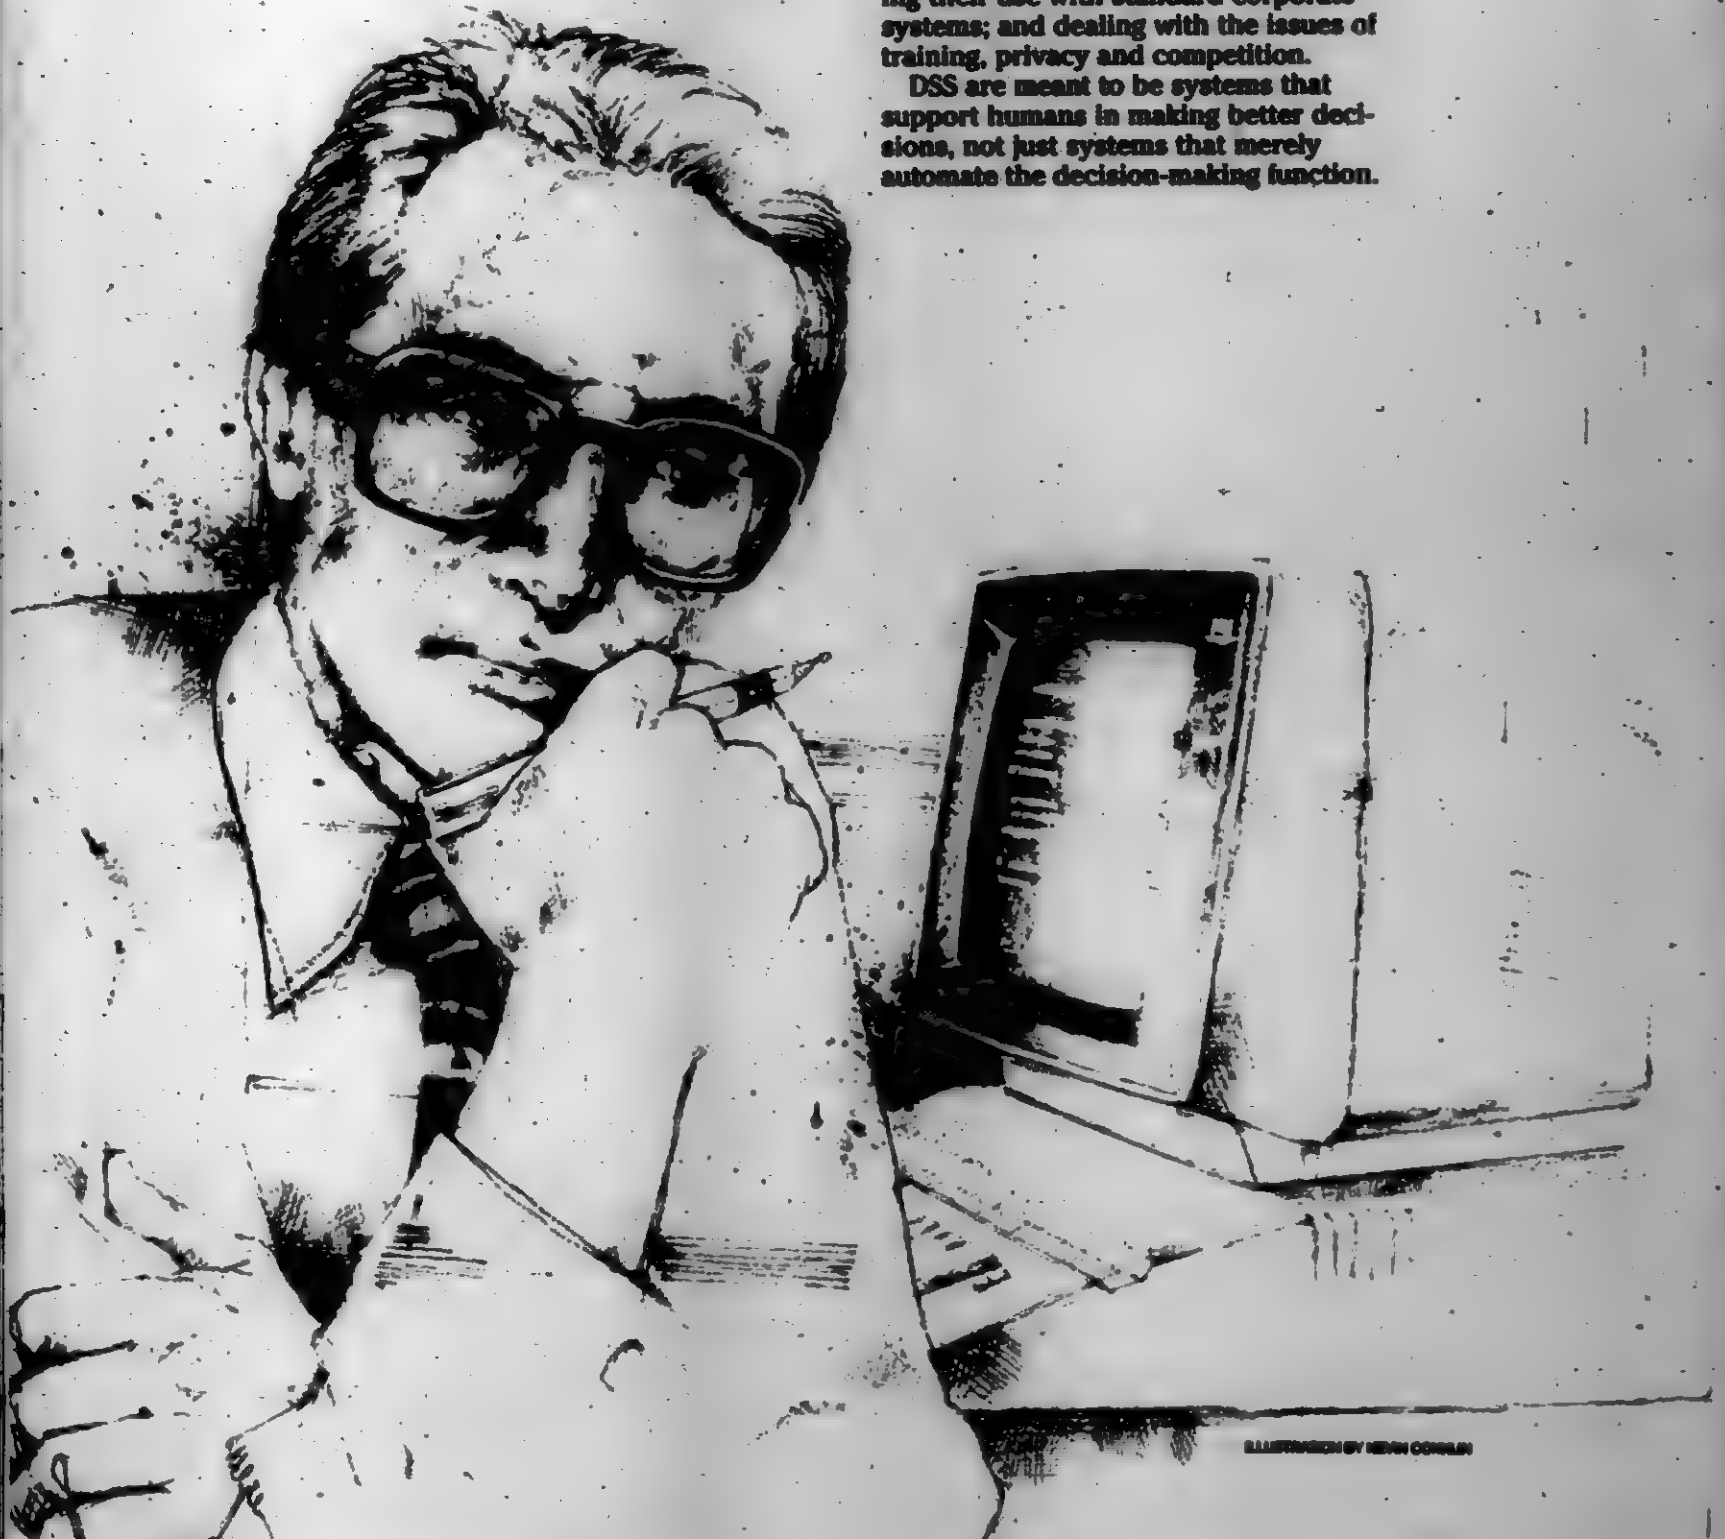

ILLUSTRATION BY KEVIN CONKLIN

This distinction gives a better perspective on how the micro can help.

The four basic elements of any DSS are decision, model, data and user interface. A wide variety of DSS, ranging from spreadsheets to artificial intelligence models of human behavior, can be constructed with these four elements.

Now, packages consistently are being announced with more specialized models already built in. A rapidly growing base of micro users with neither the interest nor the training for programming their own systems reinforces this trend toward vertical market DSS.

Spreadsheets

The most widely used modeling tool is the spreadsheet. The original one, Visicalc, was developed by Software Arts, Inc. under severe memory and processing capacity constraints. Nevertheless, with it, even a 48K-byte Apple Computer, Inc. Apple II+ could be used to model balance sheets, income statements and cash flows in hours rather than days or weeks. Spreadsheets are well understood by accountants and financial managers, many of whom found a secret wish fulfilled when they acquired the ability to build a spreadsheet that instantly showed the results of any change.

The "what-if" facility of a spreadsheet or any DSS helps support the decision-making process. For example, a food service company is required to prepare proposals. These proposals specify costs of feeding individuals in health care facilities at satisfactory levels of nutrition.

> ”
>
> *Spreadsheets are well understood by accountants and financial managers, many of whom found a secret wish fulfilled when they acquired the ability to build a spreadsheet that instantly showed the results of any change.*

Prior to Visicalc, each proposal required two people's efforts for three days, during which time they tried two alternative menus and bid the lower cost menus. As the work load grew, it became difficult to train additional people for the bidding task.

When the company's president was introduced to Visicalc in 1980, his reaction was, "I can use that right now!" Within a week, employees were preparing bids in less than three hours and analyzing 12 different menus in the process. In addition, this ability to analyze differing selections of foods generated more winning bids.

Which spreadsheet program is best? For a specific application, any of the major spreadsheets — Lotus Development Corp.'s 1-2-3, Microsoft Corp.'s Multiplan or Sorcim Corp.'s Supercalc 3 — may have an advantage over one another, but the overall functionality is basically the same.

Most users prefer to stay with whatever spreadsheet they first learned. More experienced personal computer users had been staying with advanced versions of Visicalc; however, the package was recently taken off the market. Most newer IBM Personal Computer users have chosen 1-2-3. Because Microsoft has priced Multiplan very low if bundled with a system, that product has high penetration on non-IBM systems and adequate sales in the IBM market.

When introduced, Lotus' 1-2-3 took advantage of the memory available in the large, 16-bit micros and was written to be very efficient in running speed — an advantage it still retains. The integrated graphics give the user a choice on the output side — graphics often being a more efficient way to present decision variables. The 2,048 rows available in 1-2-3 allow large models and small data bases to be created and maintained without the need for learning any other package.

Multiplan, written in the C language, can be ported to a large variety of systems. A Multiplan user can easily do multipage spreadsheets, using the package's third dimension for consolidations. In addition, the use of templates has been encouraged.

Supercalc 3.2, with its earlier versions' restrictions on number of rows removed, is now a worthy competitor for 1-2-3's market.

Financial planning systems

As you reach the limits on the functions available in the simple spreadsheets, financial planning systems become more attractive. These systems lack the totally interactive model building and execution of spreadsheets, but they can work with larger amounts of data.

Systems such as Micro-DSS/Finance from Addison-Wesley Publishing Co., Finar from Finar Research Systems Ltd. or Microplan from Chang Laboratories, Inc. perform present value, cash flow, depreciation and regression analyses on models with very large amounts of data. For example, Desk Top Financial Solutions, Inc.'s DTFPS can handle 500-by-100,000-cell worksheets.

Financial planning systems are particularly useful if an organization has one central group build a model (for example, for budgeting), and many different users then work with that model on their own departmental data.

A more general interactive equation handler is TK!Solver, which is owned by Lotus but was developed by the same Software Arts team that developed the original Visicalc concept. With TK!Solver, the user inputs equations in algebraic format, along with definitions for the variables in

Move Over, One Minute Manager!

Practical Project Management, the comprehensive new guide by Meilir Page-Jones, has just been published by Dorset House! Packed full of special advice for the data processing industry, this new book by the author of *Practical Guide to Structured Systems Design* tackles the software quality crisis and tells why managers need more than just the latest tool or technique to produce a high-quality system. Among the many topics treated in-depth are ways to:

- reduce costs and increase profits
- understand the users' business better
- master the political and technical environment
- hire, train, and motivate people
- set realistic, attainable goals and deadlines
- participate in and run more productive meetings

Numerous diagrams and examples; 248 pages; $28, soft; ISBN: 0-932633-00-5

Ethernet TCP/IP for VAX/VMS Off the Shelf!

Complete package for $8,795

Excelan offers a complete high-performance communications package including hardware, software, transceiver and all cables. Everything you need to perform high speed file transfers or do remote logins via Ethernet from a VAX running VMS or UNIX System V to UNIX 4.2 BSD machines and vice versa. Software includes TCP/IP protocols, and standard FTP (file transfer) and Telnet (virtual terminal) applications.

The entire VAX/VMS package is only $8,795, including the EXOS 204 Ethernet controller (quad-size Unibus board), EXOS 8040 TCP/IP software, EXOS 1100 transceiver and cables. And the entire UNIX System V package is only $7,295.

Excelan also offers similar packages for DEC PDPs, UNIX supermicros, and the IBM PC, XT and AT.

EXCELAN

2180 Fortune Dr. San Jose, CA 95131

From IRMA, who's linked more IBM PCs to larger computers than anyone else in the world; comes just what you need. A Smart Alec.

Introducing Smart Alec.

IRMA's reliable new way to connect PCs to IBM System 34s, 36s and 38s.

He comes from the IRMA™ family, the people who have linked more than 150,000 PCs to mainframes.

He's Smart Alec™, the new interface board that's now opening lines of communication between IBM® PCs and System 34s, 36s and 38s.

Smart Alec's hot key lets PC users switch back and forth from the personal computer to the host computer quickly and easily.

Smart Alec includes his own fast file transfer software for both uploading and downloading data into popular application packages like Lotus 1-2-3® and WordStar.®

He's so smart that he can handle three host sessions simultaneously.

And he's fully compatible with twinax cables.

What's more, an optional file transfer program gives you additional security and record-selection capabilities you just can't get from IBM.

So if you want your IBM PC, XT or AT to emulate a 5251 Model 11, 5291 or 5292 terminal—and your PC printer to emulate an IBM 5256 System printer—don't worry. It's so easy, a kid can do it.

To find out more about Smart Alec, call us at 1-800-241-IRMA. Or write Digital Communications Associates, Inc., 1000 Alderman Drive, Alpharetta, Georgia 30201.

[illegible]

the equations. You then specify values for variables on either right or left sides and let the system solve (or back-solve) the system of equations to fill in any undetermined values.

The same "what-if" concept that financial types have become used to with Visicalc is now available to civil engineers, circuit designers, econometric forecasters and others who can formulate equations to describe their decision situation. Although not nearly so popular as Visicalc, these options are being used more often, especially in the engineering field.

Traditional decision support tools have often grown out of the operations research methodologies. Linear and integer programming, queueing models, multiple linear regression and other operations research techniques are now available on micros. For example, the DSM package from DSS, Inc. integrates a number of such systems.

The user interfaces to build such models still require more work. It takes a knowledgeable user or consultant to understand how to define and structure a model. When such models are set up, however, they can yield impressive results.

Artificial intelligence

Artificial intelligence has long been a goal of many researchers and workers in the decision support field. Rather than modeling the system, AI programs model the brain of the most intelligent decision maker — thereby building on experience.

Most successful AI programs require massive computing environments. As a result, many observers believe it will be some time before micros can do much in the AI domain.

Nevertheless, several vendors have borrowed from AI in some way. One, Human Edge Software Corp. has a set of packages that are meant to aid in negotiating, sales and personnel management strategies and tactics. The set's packages require users to answer a large number of questions, first about themselves and then about the specific situation.

For example, a sales representative might characterize a customer as a bargain hunter who is concerned about features and who must make a decision by next Thursday. The system, after reviewing the salesperson's own tactics, may suggest pushing features and asking a higher price, then cutting the price at the end to give the customer the feeling of getting a bargain. This advice, which may seem simplistic, can help clarify thinking about how to approach others in similar situations.

Another support tool is a package called Lightyear, from Lightyear, Inc. It is designed to help managers work with both quantitative and qualitative information in analyzing a decision.

Like a spreadsheet package, Lightyear performs bookkeeping functions and data display; unlike spreadsheets, however, it has a lot of built-in knowledge about decision analysis. Users list the alternatives available (for example, sites in plant site selection), define criteria and their importance (cost, quality of labor, quality of life and so on) and evaluate criteria using numbers, words or positioning marks on a line.

Lightyear also permits the user to add rules (similar to expert system rules) to help eliminate alternatives. Users can then see summaries, compare alternatives and observe the effects of specific rules or models on the evaluation process.

Whether end users will take the time to input all the data in order to benefit from Lightyear's power remains to be seen, but it is clearly an interesting new concept in decision support.

Expert Ease, developed from research done at the University of Edinburgh, tries to deduce the classification rules of experts by examining attributes of specific cases of a decision. A Visicalc-type interface is used to present cases as rows of a large spreadsheet, with attributes of the decisions as the columns.

For example, the decision may be to grant or deny credit to a customer. Attributes might include salary, years in current residence, amount of purchase and so on. Given a set of cases, the system will come up with a decision rule that will yield the same results or will point out inconsistencies in the data, noting the need for additional attributes.

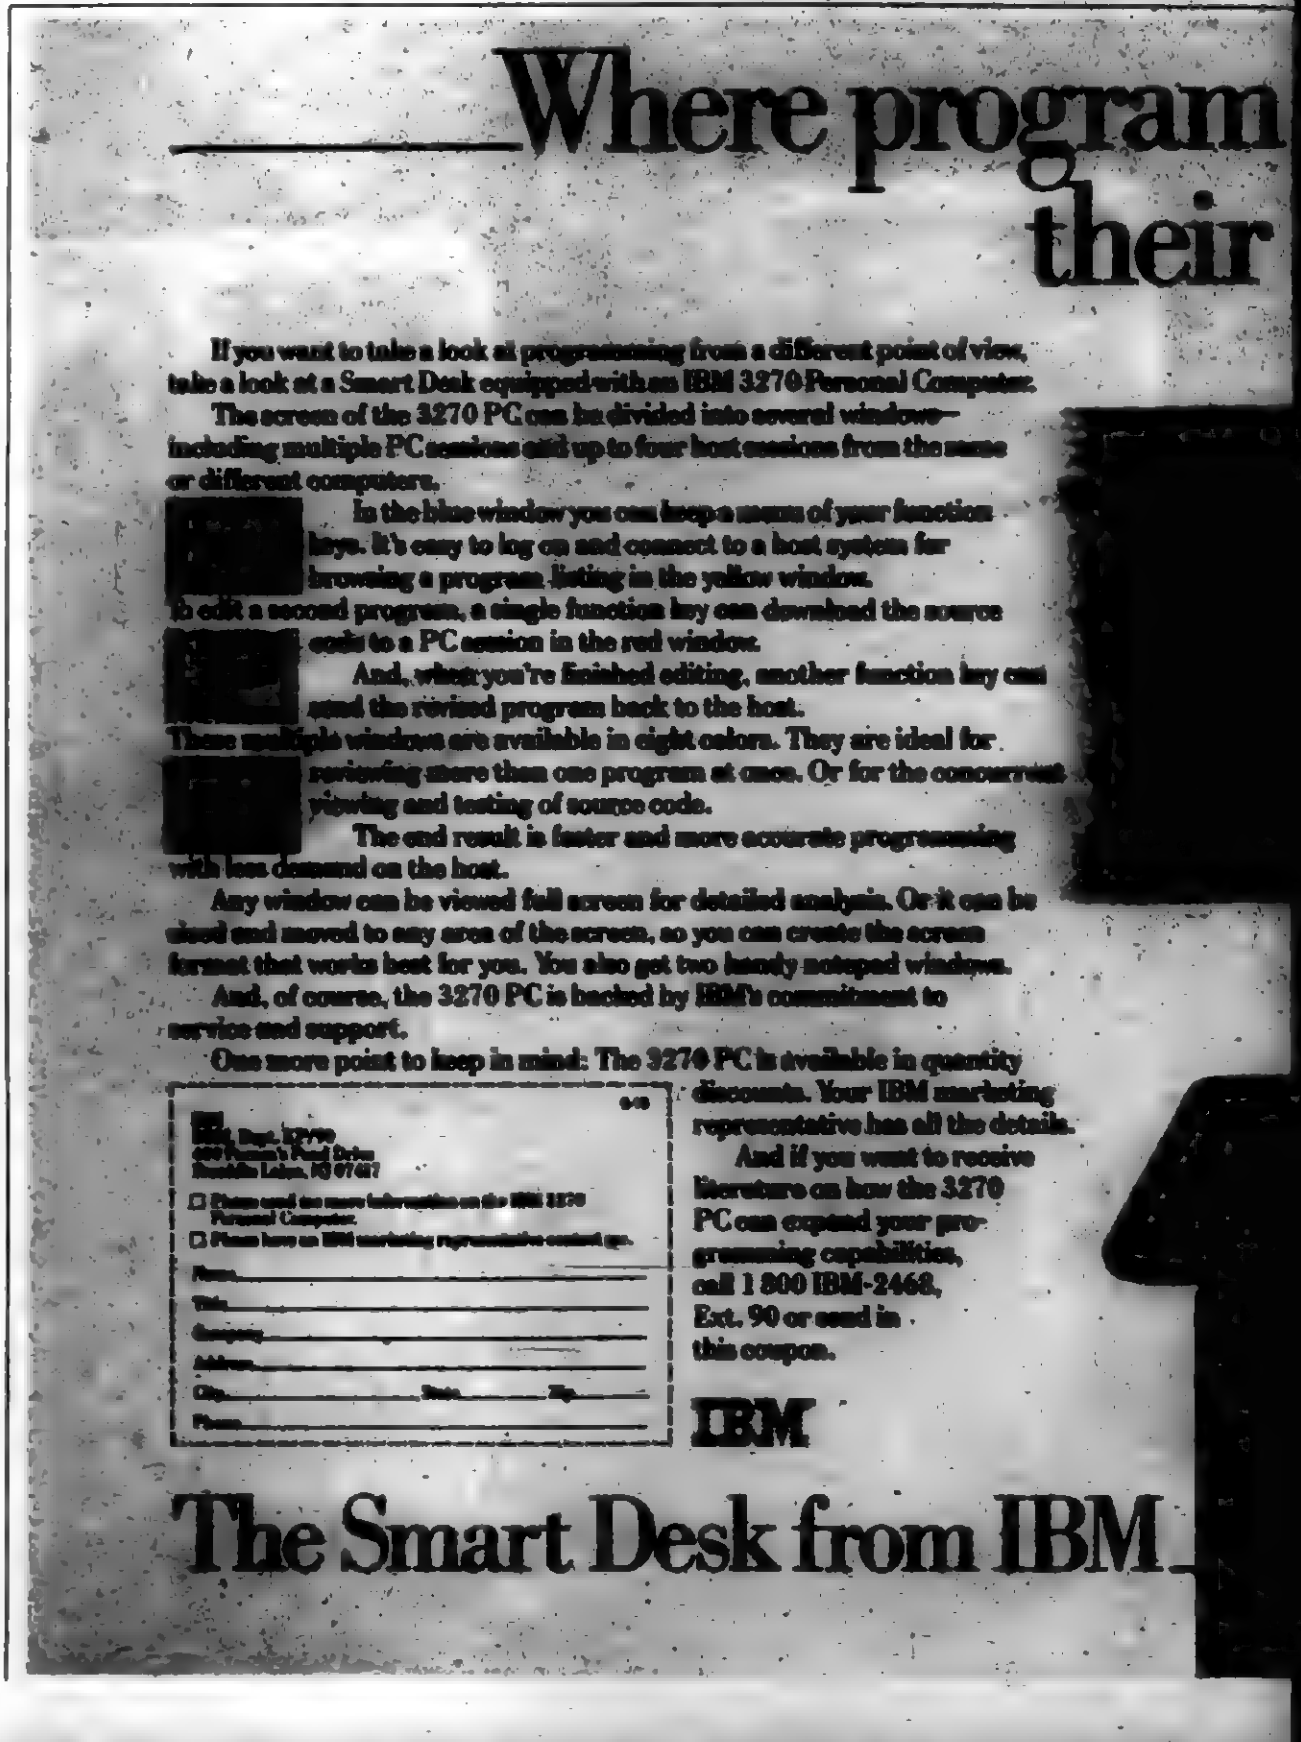
Graphics

A broad range of packages for various types of decision modeling already exists on micro-based systems and, in many ways, the intimacy of the user interface makes these packages more accessible than mainframe DSS work.

One key way that micro DSS make the user interface more appealing is through the use of graphics. Graphics can be integrated for presentation, as in 1-2-3, Symphony or Ashton-Tate's Framework, or used to speed the linkage between graphics tools and other packages, as with Supercalc and Apple's Lisagraph.

The movement toward mouse/pointing/icon-based interfaces, as typified by the Macintosh software (the long-awaited Lotus Jazz is said to be an excellent example), should lead to systems that can be learned more quickly than previous packages.

In some cases, the graphics itself are part of the interface. In the Vergin system, developed at the University of Pennsylvania, unskilled dispatchers are able to make use of a sophisticated mathematical programming model for optimal vehicle routing. The dispatchers' interface consists of pictures of trucks on a graphical map of customers, with varying colors used to link trucks and customers. Schedule modifications and their impact on total costs and variables such as overtime and



Where program
their

If you want to take a look at programming from a different point of view, take a look at a Smart Desk equipped with an IBM 3270 Personal Computer.

The screen of the 3270 PC can be divided into several windows— including multiple PC sessions and up to four host sessions from the same or different computers.

In the blue window you can keep a menu of your function keys. It's easy to log on and connect to a host system for browsing a program listing in the yellow window.

To edit a second program, a single function key can download the source code to a PC session in the red window.

And, when you're finished editing, another function key can send the revised program back to the host.

These multiple windows are available in eight colors. They are ideal for reviewing more than one program at once. Or for the concurrent viewing and testing of source code.

The end result is faster and more accurate programming with less demand on the host.

Any window can be viewed full screen for detailed analysis. Or it can be sized and moved to any area of the screen, so you can create the screen format that works best for you. You also get two handy notepad windows.

And, of course, the 3270 PC is backed by IBM's commitment to service and support.

One more point to keep in mind: The 3270 PC is available in quantity discounts. Your IBM marketing representative has all the details.

And if you want to receive literature on how the 3270 PC can expand your programming capabilities, call 1 800 IBM-2468, Ext. 90 or send in this coupon.

lateness of deliveries can all be grasped by glancing at the screen. More such graphically based DSS are likely to be available soon.

Managerial role

MIS managers can play a key role in the use of DSS packages by providing data. Rarely do managers who are using DSS have easy access to the large volumes of current data required by the models they build. In fact, one aspect of the growing use of micros is the increase in computing cycles on mainframes as a result of micro data needs.

Usually, an extract from a real data base is suitable for modeling efforts. It is not necessary to tap into a real-time system for a model whose output is used to guide policies for a one-year horizon. But getting the data into proper format for use on the micro and actually communicating it has not been easy.

Cullinet Software, Inc.'s Golden Gate permits a micro user to build a data request to an IDMS data base interactively. With a heavily menu-driven interface, a user who is somewhat familiar with the data base in question can construct the query and download the Golden Gate spreadsheet. Framework, Peachtree Software, Inc.'s Peachlink and the Answer series from Informatics General Corp. all have similar facilities. They usually download using DIF or Sylk formats acceptable to Visicalc, 1-2-3, Multiplan and others.

Natural-language data base interfaces are becoming available. Clout II, from Microrim, Inc., permits English-like interfaces to its Rbase, Ashton-Tate's Dbase and other data bases and puts the output into DIF format for interface to various DSS.

Training, support, data base maintenance, analysis of offerings and hardware and software selection are ways the manager of the information center can play a role in encouraging effective use of micro-based DSS in large or small organizations. Education in modeling concepts — how to use a spreadsheet and what assumptions to make and not to make in building financial models — can be provided through central facilities.

An emerging problem with the use of spreadsheet models is lack of validation of such models before they are passed on to others. Often, assumptions are not documented in the model, and users who have not built a model may not understand the limits intended by the originator. For example, a model may not include tax tables that vary tax with amount of income; it may merely have used the marginal tax rate appropriate for the specific amounts in the first user's cases. The old Gigo (garbage in, garbage out) rules apply as well to micros as they do to mainframes.

Using the standards of mainframe software development usually does not make sense with micros; the overhead is too large for the effort. However, in the case of building templates that permit later consolidation of results, the information center can perform a service to the company. Here, a budget model can be prebuilt and distributed to end users.

The information center may also have a link program to get current information from the center's data bases into the models. Higher level management can then pull together the departmental models into a corporate budget, with the knowledge that consistent assumptions and labels have been used.

Finally, the center can help users with mundane but often ignored chores — backup of files, models and so on. Micro users seem to believe their floppy disks are invulnerable — until the first disaster.

> *The ability to simulate experience can save millions of dollars in wasted efforts.*

DSS can be of profound benefit to an organization and its management. The ability to learn without doing — to simulate experience — can save millions of dollars in wasted efforts. The "what-if" facilities of DSS give the user an understanding of the sensitivity of a particular decision outcome to variations in a number of input values in a way not feasible without a computer.

Competitive necessity

The use of DSS is becoming a competitive necessity — both internally within an organization and externally with outside competition. Just as today's airlines require reservations systems to keep up, banks require DSS models to bid on large corporate bond offerings.

Similarly, within an organization, managers who perform better, aided by DSS, will have the edge over their peers. When DSS can clarify a decision process so that the process can be replicated, decision making can move down in the organization, freeing time at higher levels.

The role of the information systems manager is to make sure that modern tools are used to their maximum advantage to benefit the organization. Although DSS use will spread with or without the assistance of information center personnel, it will be most effective with their guidance, data base resources, training and support. Getting started in micro decision support is a necessary prerequisite to an organization's effective competition in the future. The time to begin is now.

TURBO

Why are SYBACK & SyncSort CMS the fastest things on no wheels?

(More technology in the tank!)

Call (201) 568-9700.

Arrange a test drive.

SYBACK • SYNCSORT CMS • SYBACK • SYNCSORT CMS • VM

You say you've always had very simple tastes? All you ever wanted was the best?

Well, step into our showroom and kick a few tires! We'll show you two programs that are the Ferrari and Lamborghini of VM programs.

- **SYBACK — the world's fastest and most maneuverable backup, restore and copying program;**
- **Syncsort CMS — the world's fastest and most maneuverable VM/CMS sort program.**

What makes 'em so special? Well . . .

(1) TURBO PERFORMANCE: Have you ever stepped down on the gas in a dangerous driving situation and discovered . . . nothing? Well, that'll never happen to you with these two vehicles.

Both are equipped with our special brand of "software turbocharging." We call it FBT, which stands for Fluid Buffering Technique. Our competitors call it something else.

We discovered FBT one dark and rainy night when we were trying to find a way to speed up the movement of data in sort programs. After crying "Eureka," we applied it to our OS and DOS sort programs. The results were . . . wow!

Now we've carried that bright idea over into VM dump-restores and sort programs. And the results are still wow! Compared to any other backup or sort program clogging the nation's VM thruways today, SYBACK and SyncSort CMS will save you up to:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **55% in TTime;**
- **75% in SIOs.**

So who needs all that speed? You do. If you want to optimize your VM operations, stay out of needless DP traffic jams, and make the boss happy with your throughput.

Here's what happened to one large government agency: Their backup operations used to require a full 24 hours to complete. Then they installed SYBACK. Now their backup takes — are you ready? — one-half hour!

(2) EASY HANDLING: SYBACK and SyncSort CMS are among the most flexible, user-friendly programs ever produced by anybody anywhere. That's one reason programmers love 'em. And where does it say that backup and sort operations have to be hard to be good?

(3) "MISTER SOFTWRENCH" SERVICE: We've got the best pit crew in the business. More than 85% of all customer requests are resolved within 24 hours.

If you'd like to put a little high technology in your VM tank, give us a call. We might even take your used VM dump-restore or sort program as a trade-in!

syncsort INC.

Syncsort Incorporated 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

SOFTWARE & SERVICES

SOFTLINE/STEVEN PFRENZINGER

IBM's DB2: An analysis

By now, it should be obvious that IBM's DB2 is going to have a significant impact on the mainframe data base management (DBMS) system market. The fact that DB2 can be accessed through all three MVS data communications systems — TSO, CICS, and IMS/DC — should be of interest to anyone planning for the future with these transaction managers.

DB2 is a major product with many features — more than can be covered in a single article. But a discussion of its status, along with comparisons to IMS/DB, is possible and especially relevant to the experienced IMS developer.

While DB2's impact will be felt initially within the information center in decision support applications under TSO, it will eventually see substantial use in both CICS and IMS/DC environments. Taking the time to investigate DB2 and relational DBMS in general, it should be obvious why this will happen. The list of DB2's advantages is extensive (see chart page 54).

Before continuing, a brief definition is appropriate. A relational DBMS like DB2 is one that users perceive as a collection of tables. Tables in a relational DBMS are no different from other flat file structures. A simple example of a table would be a spreadsheet with its row and column structure and a cell at the intersection of each row and column. Similarly, a

See DB2 page 54

Pfrenzinger is president of IMS Consulting, Inc., an Encino, Calif.-based consulting firm that specializes in IBM's IMS DB/DC and CICS/DL/1. He has 15 years of data processing experience and is a regular contributor to Softline.

SAS, ISPF link debuts

CARY, N.C. — SAS Institute, Inc., based here, and Morino Associates, Inc., of Vienna, Va., have announced an interactive applications development tool that is said to link the SAS System software with IBM's ISPF. The SAS/DMI software — developed by Morino and marketed by SAS — is scheduled for availability during the fourth quarter.

The SAS/DMI software allows the SAS System's fourth-generation language to implement ISPF applications more quickly than procedural languages such as Cobol or PL/I, according to a spokesman. Users of IBM 370, 30 series or 4300 series machines and compatibles under IBM's OS can convert SAS files to ISPF tables and vice versa.

Prewritten procedures within the SAS System can be used to analyze, display graphically and report on data stored in ISPF. The interface is said to employ the SAS Data facility to develop custom-tailored applications in which entries are verified and information retrieved as the Data facility executes.

The software, which supports both

See SAS page 58

IBM upgrades RACF system

WHITE PLAINS, N.Y. — In conjunction with its announcement of an enhanced release of CICS, IBM also introduced an updated version of its Resource Access Control Facility (RACF) security system for MVS and VM. Version 1, Release 7 of RACF offers a variety of new capabilities, many of which IBM said were in response to user-submitted requirements.

The major RACF security enhancements were in the areas of access control to programs, program access to data sets and Dasd erase-on-scratch support. The system is also said to offer users an opportunity to gain back some virtual storage.

In the area of access control to programs, RACF now allows only authorized users to load and execute specified load modules. Improvements to program access to data sets now ensure that authorized users or groups may access specified data sets only while executing certain programs. Erase-on-scratch support gives users the option of invoking the erasure of security-sensitive data extents on Dasd at the time the data is released for reuse.

Other enhancements to RACF include

See RACF page 55

Users unite

Telling users they should participate in users groups is like urging the citizenry to vote.

Users interested in the future of a product, especially a product on which their companies depend, should take an active role in determining that future — just as voters have an obligation to make their voices heard in government. Unvoiced needs often go unmet. That's such an obvious message that many users tend to ignore it. But it is one they would do well to heed.

IBM's unveiling of Version 1, Release 7 of CICS serves as a powerful reminder of the importance of making one's viewpoint known through the very effective channel of a users group.

There was much in the announcement of the enhanced CICS to grab the eyes of users. Major enhancements included the ability to define terminals automatically, a facility that allows users to define resources on-line and improved recovery and restart capabilities. The version also offers users the chance to grab back some much-needed virtual storage.

But perhaps the most significant aspect of the announcement was IBM's explicit acknowledgement of the user input that spawned the changes to CICS — a core product in most IBM mainframe environments. In fact, the opening sentence of the announcement materials — the so-called ivory sheets — stated that "CICS Version 1, Release 7 responds to a large number of user requirements with a range of enhancements that focus on improving [the] productivity of customer data processing personnel."

Deeper into the ivory sheets, IBM said that the enhancement of the transaction manager "addresses numerous user requests and satisfies the . . . requirements submitted by the Guide and Share users groups." Numerous is an appropriate word: IBM listed 56 requirements submitted by both Guide

Eliminate two million disk I/O's per day!!

BIM-PDQ (POWER Dynamic Queuing) eliminates 90% of the I/O to the DOS/VSE POWER Spooling Queue File by keeping a copy of the file in memory. This is the heaviest used disk file in many DOS systems. Queue access from all sources are intercepted. Queue display response time is dramatically reduced, and overall system performance significantly improved.

Shared spooling also supported.

An optional feature automatically deletes print queue entries of a user-specified age.

Call for full documentation or free 30-day trial.

Price: $2400 or $120/mo. Shared spool support additional.
Auto-delete feature $600 or $30/mo.

Informatics to market micro link for IBM CPUs

CANOGA PARK, Calif. — Informatics General Corp. has announced that it will market a version of Micro-Tempus, Inc.'s Tempus-Link — to be known as Alpha/Link — micro-to-mainframe communications product for IBM mainframes running VM/CMS, OS and DOS/VSE and IBM Personal Computer and compatible machines.

A spokesman said that the initial release of Alpha/Link offers the same capabilities as Tempus-Link, with the exception of an added automatic logon facility, the vendor said. A virtual disk residing on an IBM mainframe can be accessed and controlled with all IBM PC-DOS commands from authorized Alpha/Link users.

Alpha/Link supports a variety of communications interfaces that permit access to virtual disks via IBM 3270 terminal emulation devices and remote and local asynchronous TTY.

Alpha/Link consists of three microcomputer floppy disks and a mainframe module. Base price of Alpha/Link is $6,200.

Informatics General is located at 21031 Ventura Blvd., Woodland Hills, Calif. 91364.

Issco mainframe graphics interface for IBM micro bows

SAN DIEGO — Integrated Software Systems Corp. (Issco) has introduced PC Linkagraf, a software interface that reportedly allows an IBM Personal Computer to act as an intelligent mainframe graphics terminal.

PC Linkagraf reportedly allows plots saved on the Personal Computer to be viewed independently of the host. PC Linkagraf also permits hard copy to be produced off-line using devices connected to the Personal Computer.

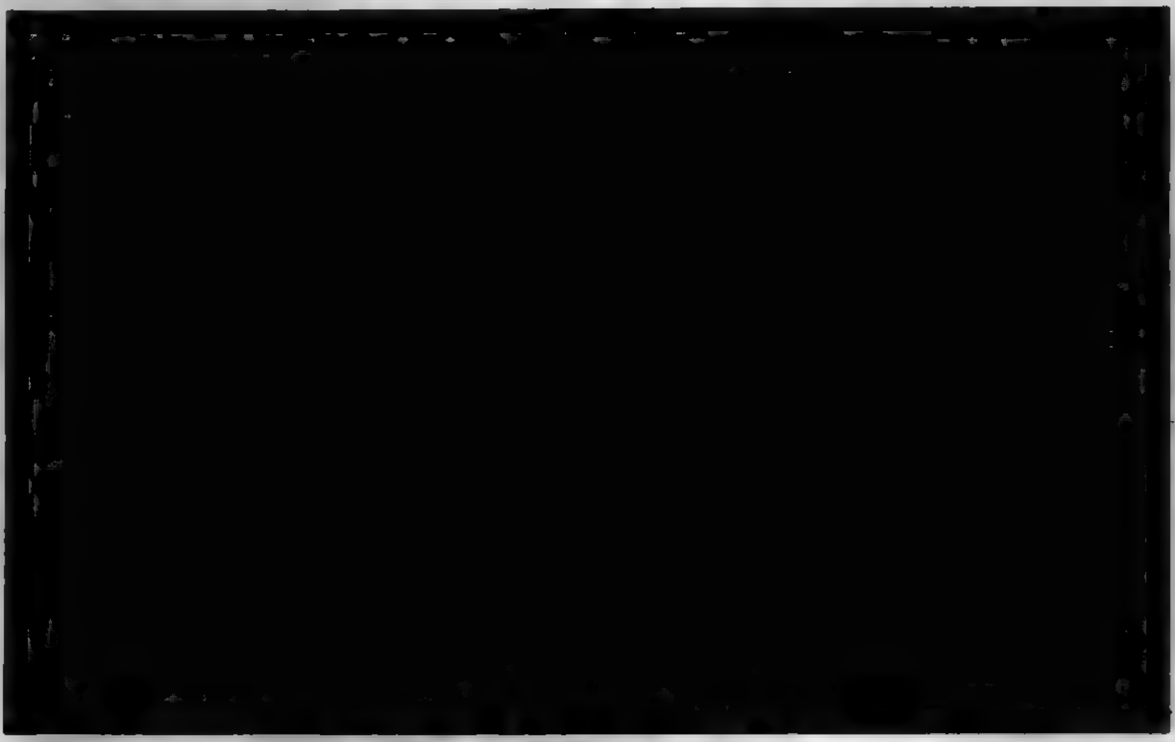
The software is said to include full screen Help functions and support for user-defined function keys. PC Linkagraf enables users to transfer Personal Computer files to and from a mainframe.

The mainframe component of PC Linkagraf is priced from $2,000 to $4,000, depending upon the CPU used. The Personal Computer module is priced at $250.

A corporatewide site license is priced from $250 to $750 per month per mainframe. The license price allows any number of Personal Computers to be connected.

Issco is located at 10505 Sorrento Valley Road, San Diego, Calif. 92121.

Try to find software that solves your problem.



Or call BOEING.

Acquiring mainframe and micro software that best fits your needs isn't easy. Today's software landscape seems unending. So to obtain software that actually achieves your specific objectives, you need programs with proven problem-solving capabilities. Like software from Boeing.

Every software package from Boeing Computer Services is backed by Boeing expertise and experience. That's why both users and data processing professionals appreciate our solutions to a myriad of computing needs. Executives in many industries depend on our financial modeling and decision support software for accurate, up-to-the-minute pictures of business activity and for reliable forecasts. Production managers turn to Boeing for on-line manufacturing software that can keep track of all elements in the production cycle . . . even in exacting make-to-order plants. Engineers increase their productivity with dynamic analysis and simulation using Boeing software. Boeing computer-based instruction software and courseware is central to the education and training programs of many companies, large and small. It is used cross-company and cross-discipline.

One of the newest relational data base management systems on the scene comes from Boeing. Its cost is low, its function is extensive. It runs on IBM, CDC, DEC VAX, Data General and Prime computers, and interfaces with a micro version.

For more information about Boeing software solutions, call (206) 763-[illegible]. Or write BOEING COMPUTER SERVICES, M/S 7K-11, P.O. Box 24346, Seattle, WA 98124. Ask about our "TRY IT" evaluations.

For information about Boeing's other integrated information services — including enhanced remote computing, distributed processing, network services, office automation, consulting, and education and training — call toll free 1-800-447-4700. Or write BOEING COMPUTER SERVICES, M/S CV-26-[illegible], 7980 Gallows Court, Vienna, VA 22180.

BOEING COMPUTER SERVICES A Division of The Boeing Company

Software out from Promod

LAGUNA HILLS, Calif. — Promod, Inc. has announced an integrated systems design environment for Digital Equipment Corp. VAX processors and the IBM Personal Computer XT and AT.

The Promod software is said to allow analysis data to be exchanged between the mini and micro systems at any time during the design cycle. Operating independently of the target system and language, Promod integrates structured analysis, modular design and pseudocoding.

The five phases of the Promod design cycle are requirements analysis and definition, based on the Yourdon methodology of structured analysis; transformation from analysis to design, during which Promod automatically creates modules, function descriptions and data types; system design based on modular design concepts; program design based on pseudocode methodology and step-wise refinement; and implementation using code generators to automatically create program templates from pseudocode. Portions of any phase can be accessed for independent analysis, definition and editing of data or graphics.

On the micro, Promod requires 512K bytes of memory and 10M-bytes of hard-disk storage. It supports all DEC VAX systems running under VMS.

Prices for Promod range from $9,950 for the IBM Personal Computer to $37,500 for the DEC VAX-11/780.

Promod is located at 22961 Alcalde Drive, Laguna Hills, Calif. 92653.

"Hey guys — the menu is up!"

CA-Scheduler upgraded

JERICHO, N.Y. — Computer Associates International, Inc. has announced an enhanced version of CA-Scheduler, its production scheduling and management system for IBM MVS operating systems.

Version 7 is said to include an on-line and menu-driven design for more efficient monitoring of scheduling data. It also incorporates Computer Associates' standards for installation and maintenance and CA-Earl, the vendor's report writer.

CA-Scheduler 7 is available for MVS and MVS/XA and supports IBM's JES2 and JES3. It runs under IBM's TSO, CICS and VM/CMS. The cost of the software is $60,000 for a perpetual license and $40,000 for a three-year lease, according to the vendor.

Computer Associates International is located at 125 Jericho Tnpk., Jericho, N.Y. 11753.

CICS monitor version debuts

LOS ANGELES — Candle Corp. has introduced Version 400 of its Omegamon/CICS real-time performance monitor for IBM CICS transactions.

With the addition of an External Monitoring facility, Omegamon/CICS now allows users to monitor remote CICS sites through IBM's Vtam. The product also includes virtual storage constraint relief capabilities and umbrella transaction support, according to the vendor.

The External Monitoring facility is said to protect Omegamon from CICS transactions containing loops, abends or storage violations.

Version 400 of Omegamon/CICS operates under IBM's MVS/370 and MVS/XA operating systems. The product is available for $23,500.

Candle is located at Suite 2404, 10880 Wilshire Blvd., Los Angeles, Calif. 90024.

Tools out from FPS

BEAVERTON, Ore. — Floating Point Systems, Inc. (FPS) has announced three systems development software products for its FPS-5000 series array processors. The products are said to simplify the code writing process and to allow users to take advantage of coprocessors.

The Fortran 77 compiler allows users to use standard Fortran 77 statements in developing routines and includes a compiler, linker, librarian and debugger. The product allows programmers to use coprocessors by issuing Fortran subroutine calls and allows access to up to 4.75M bytes of system common memory.

Xpal, a coprocessor assembly language, allows users to write their own math library routines when used with a microcode simulator.

In addition, several new math library routines for specific applications use a 128-bit instruction word, accommodating multiple parallel operations and giving the programmer extensive control over data flow.

Prices are $8,500 for the Fortran 77 compiler and $5,000 for Xpal assembly language. Prices range from $975 to $1,275 for the math library routines.

FPS is located at 3601 S.W. Murray Blvd., Beaverton, Ore. 97005.

IBM/38-36 BACKLOG REDUCTION

The world's most successful companies have made Fusion Products Intl. the leading supplier of query/report-processor and spreadsheet software for the IBM/38-36. Call 415 461-4760 or write.

Uccel unveils data center management software

DALLAS — Uccel Corp. has introduced the Resource Management System (RMS), a software package for use in Sperry Corp.-based data centers.

RMS, an integrated set of five software packages, reportedly provides management information on data center operations. Its resource accounting module tracks connect time, storage, machine cycles and other system use data. The workload capacity planning module captures system performance and utilization statistics.

The generalized graphics system module displays, through color charts, data center information gathered by RMS.

The problem-tracking system module helps managers follow user, system or data center problems from initial report through resolution. An equipment tracking module maintains an inventory of data center hardware.

The RMS software runs on Sperry 1100 series mainframes.

Its modules cost from $10,000 to $39,000.

Uccel is located in the UCC Tower, Exchange Park, Dallas, Texas 75235.

SI offers software that links System/38, micro packages

ANDOVER, Mass. — Software International Corp. (SI) last week unveiled communications software that links its general ledger package on the IBM System/38 with micro packages on the IBM Personal Computer.

According to a spokesman, Smart Link/38 allows users of the IBM Personal Computer, Personal Computer XT and AT to download information from SI's General Ledger & Financial Reporting System, to manipulate the data with packages such as Lotus Development Corp.'s 1-2-3, Visicalc and Symphony and to upload the information to the host.

The link software is said to offer the same functionality as SI's original Smart Link, which provides data transfer capabilities between the company's IBM mainframe-based software and Personal Computer products. Smart Link/38 provides Help screens and offers the ability to download in real-time either complete files or selected file extracts. The package offers security features and audit trails.

The spokesman said Smart Link/38 also features a library for storing download and upload sessions to eliminate rekeying of data.

Smart Link/38 costs $3,500. It communicates with the System/38 through available IBM 5251 terminal emulation boards.

SI is located at 1 Tech Drive, Andover, Mass. 01810.

Pilot system versions out

BOSTON — Pilot Executive Software, Inc. has announced IBM mainframe and Prime Computer, Inc. minicomputer versions of its Command Center executive information system. The company also introduced three specialized applications designed to run with the product.

Command Center is a host- and microcomputer-based system that allows MIS departments to develop or customize micro-accessed executive information applications. It displays information in both graphics and tabular form.

A version announced earlier this year utilizes Digital Equipment Corp. VAX processors and IBM Personal Computers. The added IBM mainframe version operates under VM/CMS and is priced at $125,000. The Prime version runs on any Prime processor under Primos 19.4 and is priced at $75,000. Both are available immediately.

Pilot's application packages allow a user, through a mouse-driven IBM Personal Computer, to access specialized analyses, which are summarized in graphics, text or tabular form. The applications include Competitive Analysis, Corporate Productivity Analysis and Economic Analysis, each priced at approximately $5,000.

Competitive Analysis gives users the ability to review the performance of their company against user-selected competitors. Evaluations are based on raw financial data and other performance measurements.

The Corporate Productivity Analysis package incorporates a variety of value-added, I/O and financial leverage measurements, which are formulated into productivity ratios for comparison.

Economic Analysis allows users to combine economic time series data with internal information to forecast the impact of economic changes on a companywide or industrywide basis.

Pilot Executive Software is located at 40 Broad St., Boston, Mass. 02109.

OPEN WINDOWS
BETWEEN 3270 AND ASYNC HOSTS
WITHOUT A PC.

Introducing the Lee Data 1221 Open Window Display. And MORE LEEWAY™ for your growing Information System.

The Lee Data 1221 Open Window display shatters all your old window pains.

Now, for the first time, you can open windows to 4 concurrent host sessions.

And transfer information from window to window, host to host, and 3270 to Async in any combination.

And zoom any window to full screen in your choice of 4 standard IBM screen sizes, including 132 columns.

All without the expense of PC's you may not need.

But the Lee Data 1221 Open Window display is only one way we give you MORE LEEWAY for less money . . .

Our Lee Data Passport booklet is filled with other cost-saving products you should know about too.

Do you have your Passport yet?

Call 1-800-LEE-DATA or (612) 828-0300 for our FREE booklet, MORE LEEWAY: Passport for MIS Planners. Or write to Lee Data Marketing Services, 7075 Flying Cloud Drive, Eden Prairie, Minnesota 55344.

SAS Institute Inc. Announces

Lattice C Compilers for Your IBM Mainframe

Two years ago...

SAS Institute launched an effort to develop a subset of the SAS® Software System for the IBM Personal Computer. After careful study, we agreed that C was the programming language of choice. And that the Lattice® C compiler offered the quality, speed, and efficiency we needed.

One year ago...

Development had progressed so well that we expanded our efforts to include the entire SAS System on a PC, written in C. And to insure that the language, syntax, and commands would be identical across all operating systems, we decided that all future versions of the SAS System—regardless of hardware—would be derived from the same source code written in C. That meant that we needed a C compiler for IBM 370 mainframes. And it had to be good, since all our software products would depend on it.

So we approached Lattice, Inc. and asked if we could implement a version of the Lattice C compiler for IBM mainframes. With Lattice, Inc.'s agreement, development began and progressed rapidly.

Today...

Our efforts are complete—we have a first-rate IBM 370 C compiler. And we are pleased to offer this development tool to you. Now you can write in a single language that is source code compatible with your IBM mainframe and your IBM PC. We have faithfully implemented not only the language, but also the supporting library and environment.

Features of the Lattice C compiler for the 370 include:

- **Generation of reentrant object code.** Reentrancy allows many users to share the same code. Reentrancy is not an easy feature to achieve on the 370, especially if you use non-constant external variables, but we did it.
- **Optimization of the generated code.** We know the 370 instruction set and the various 370 operating environments. We have over 160 years of assembler language systems experience in our development staff.
- **Generated code executable in both 24-bit and 31-bit addressing modes.** You can run compiled programs above 16 megabytes in MVS/XA.
- **Generated code identical for OS and CMS operating systems.** You can move modules between MVS and CMS without even recompiling.
- **Complete libraries.** We have implemented all the library routines described by Kernighan and Ritchie (the informal C standard), and all the library routines supported by Lattice (except operating system dependent routines), plus extensions for dealing with 370 operating environments directly. Especially significant is our byte-addressable Unix®-style I/O access method.
- **Built-in functions.** Many of the traditional string handling functions are available as built-in functions, generating in-line machine code rather than function calls. Your call to move a string can result in just one MVC instruction rather than a function call and a loop.

In addition to mainframe software development, you can also use our new cross-compiler to develop PC software on your IBM mainframe. With our cross-compiler, you can compile Lattice C programs on your mainframe and generate object code ready to download to your PC.

With the cross-compiler, we also offer PLINK86™ and PLIB86™ by Phoenix Software Associates Ltd. The Phoenix link-editor and library management facility can bind several compiled programs on the mainframe and download immediately executable modules to your PC.

Tomorrow...

We believe that the C language offers the SAS System the path to true portability and maintainability. And we believe that other companies will make similar strategic decisions about C. Already, C is taught in most college computer science curriculums, and is replacing older languages in many. And almost every computer introduced to the market now has a C compiler.

C, the language of choice...

C supports structured programming with superior control features for conditionals, iteration, and case selection. C is good for data structures, with its elegant implementation of structures and pointers. C is conducive to portable coding. It is simple to adjust for the size differences of data elements on different machines.

Continuous support...

At SAS Institute, we support all our products. You license them annually; we support them continuously. You get updates at no additional charge. We have a continuing commitment to make our compiler better and better. We have the ultimate incentive—all our software products depend on it.

The competition...

If you would like to compare, the other vendors of 370 C compilers are: AT&T, Whitesmiths, Ltd., WATCOM Products Inc. (CMS only), Oracle Corp., Amdahl Corp. (UTS only), and IBM Corp. (VM/IX only). We think you will choose the Lattice C compiler from SAS Institute.

For more information...

Complete and mail the coupon today. Because we've got the development tool for your tomorrow.

SAS Institute Inc.
SAS Circle, Box 8000
Cary, NC 27511-8000
Telephone (919) 467-8000 x 280

I want to learn more about

☐ the C compiler for MVS software developers
☐ the C compiler for CMS software developers
☐ the cross-compiler with PLINK86 and PLIB86

today...so I'll be ready for tomorrow.

Please complete or attach your business card.

High performance	Potential for high performance
Program specification blocks and data base definitions	Catalog

DB2

from page 49

DB2 table is made up of rows and columns with a specific item of data at each intersection. In DB2, these items are called values and cannot be part of a repeating group, that is, they cannot occur more than once.

The term "collection of tables" in the DB2 definition is analogous to a hierarchical structure made up of a collection of segment types. As for the language interface, IBM's SQL is to DB2 what DL/1 is to IMS/DB.

Besides the ease-of-use factor, one of the major benefits of SQL over DL/1 is its set-at-a-time orientation vs. the segment-at-a-time orientation of DL/1. SQL will return one or more rows on a retrieval call, whereas DL/1 will return only one segment on a retrieval call. This would equate in DL/1 to a series of calls, each retrieving a single segment.

For the IMS developer unfamiliar with DB2, there are several additional analogies that can be drawn to help relate a DB2 data base to an IMS data base. One of the comparisons between IMS/DB and DB2 that may be helpful during a conversion, for example, is that each segment type in an IMS hierarchical structure would equate to an individual DB2 table.

In other words, an IMS structure with three segment types would usually convert to three DB2 tables. An individual IMS segment occurrence would equate to an individual row in a DB2 table. A field type in an IMS segment definition would equate to a column, the vertical component of a DB2 table. A field in an individual IMS segment occurrence would equate to a value, that is, data at the intersection of a row and column in a DB2 table.

Another comparison involves converting a simple two-level hierarchy into DB2 tables. If there is a root segment, called an order header, and a dependent segment, called an order item, the developer would have to create two DB2 tables, one for order headers and the other for order items. In DB2 there are no pointers from rows in the order header table to associated rows in the order item table — as with IMS/DB pointers between segment types — so developers have to add an order number column to the order item table so that DB2 can navigate from one individual order header to its associated order items.

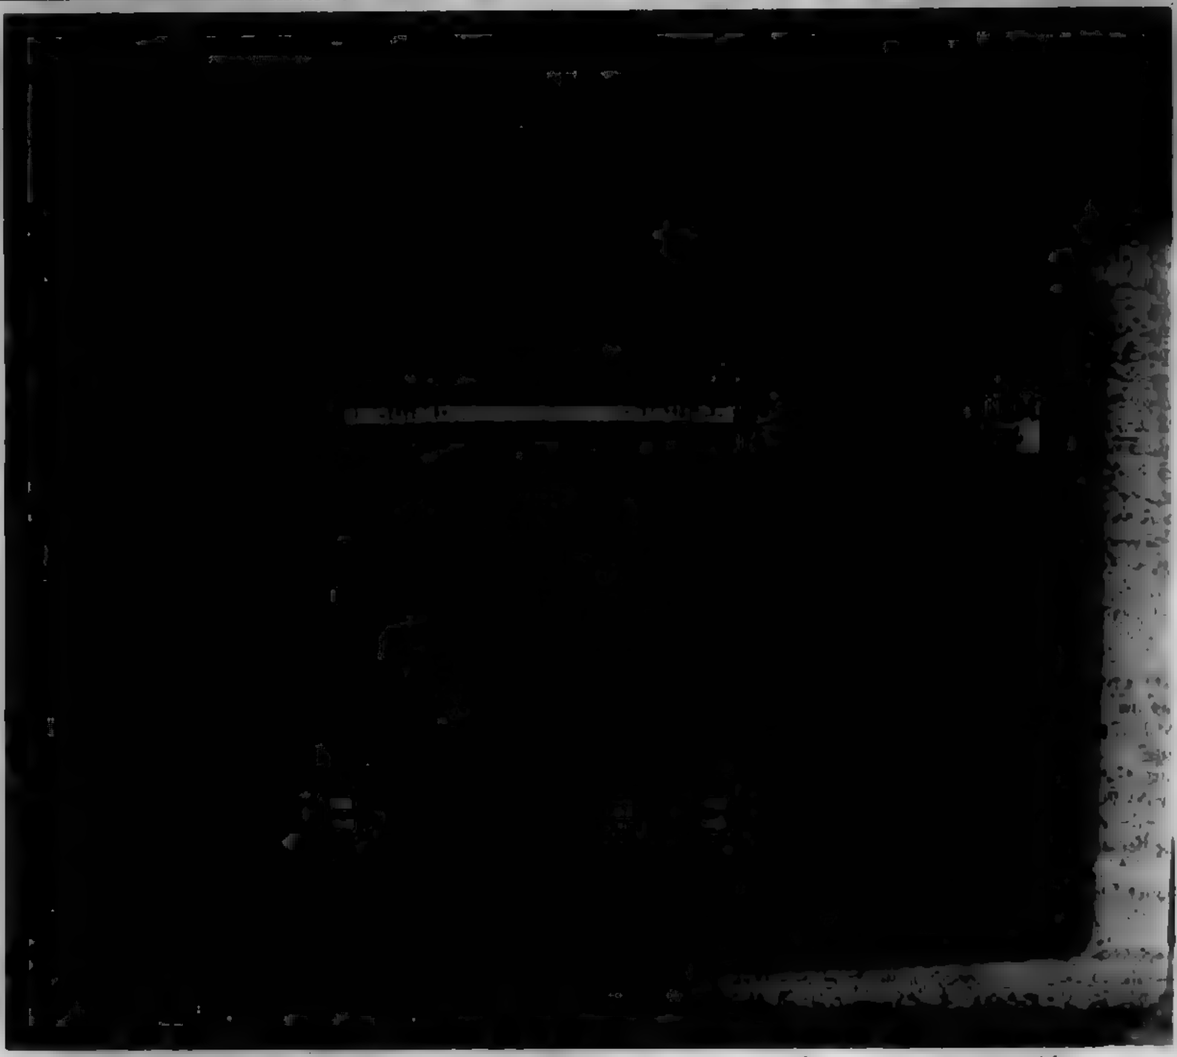
Three issues keep DB2 from achieving success in the production environment of CICS and IMS/DC: poor performance, absence of referential integrity and lack of applications development tools.

The performance issue is one that has received much attention and the conclusion is that rapid index management is the key to achieving high-performance processing. In IMS terms, this equates somewhat to having the same index pointing to several different IMS segment types. Currently, DB2's performance is roughly 50% to 60% that of IMS/DB.

The referential integrity issue must also be addressed. What is referential integrity? It is easier to describe an IMS/DB example than to describe it in DB2 terms. When a root segment in an IMS hierarchy is deleted, dependent segments are also deleted. That is referential integrity. In DB2, if a row in one table is deleted, these same cascading effects are not felt by related rows in other tables.

Referential integrity also dictates, for example, that a purchase order may not be written for a nonexistent vendor and, conversely, that a vendor cannot be removed from the data base if purchase orders are assigned to it.

The lack of DB2 applications development tools is a significant problem. Many of the current productivity tool vendors will find it difficult to mix SQL interfaces and DL/1 interfaces within their products — a necessary requirement during the transitional period when both DBMS will be in use. Cobol-based applications generators have the best chance to combine these two data base interfaces successfully into a single development environment and provide the required development tools for both DB2 and IMS/DB.



Automated Software Support For The Structured Techniques

Our pioneering with the Structured Techniques in the early '70's created a new environment for systems development, leading to a decade of building systems that are now easier to operate, and free from the costly bugs which plagued earlier systems.

The ANALYST TOOLKIT™ is a computer-assisted design software product that automates the process of systems analysis. It offers graphic capabilities to draw Data-Flow Diagrams, State-Transition Diagrams, and Entity-Relationship Diagrams, as well as free-form sketch capabilities. All this adds up to a more cost efficient way to develop and document systems specifications.

The ANALYST TOOLKIT™ runs on the IBM® PC -XT and AT, and the WANG Personal Computer and can be adapted to support any graphic system development techniques.

Attend one of our product demonstration seminars listed in the right side of this ad. We'll show you how the TOOLKIT™ can truly *simplify* your systems analysis efforts. Contact us for a descriptive brochure by calling

1-800-223-2452. In New York, 212-391-2828.

We believe we'll change the way you develop systems-again.

USERS

from page 49

and Share and their international counterparts.

Why the recognition of users groups? It's certainly not a common IBM practice to highlight users group efforts in its many product announcements.

Some IBM watchers claimed the recognition was all a marketing or public relations ploy, a sort of "you asked for it, you got it" routine. In part, that's the case. But that view is also an oversimplification.

Most users questioned about the recognition, including some users involved in Share and Guide, felt IBM was trying to stress the importance of user involvement in such organizations. They also claimed IBM was acknowledging that Share and Guide are effective channels for user input.

Considering the sheer number and diversity of its users, even the seemingly omnipotent IBM needs some help in finding out what its customers in the field need.

"I think the users group acknowledgment was very significant," said William Ray, manager of data and network services for Corning Glass Works, Inc. in Corning, N.Y. "It was not a concession on IBM's part but an effort to emphasize its involvement with Guide and Share. It was a way for IBM to say, 'we are listening to you and trying to provide the things you need.' It is a good course for IBM to take."

The users groups, according to Harvey Kramer, senior information systems consultant with Southern California Edison Co. in Rosemead, Calif., also provide an effective method for prioritizing user needs — something the Armonk, N.Y., giant may have trouble doing on its own.

"IBM was clearly showing that it is trying to listen to a vast audience," he said. "I think IBM published that to show everyone that you should be part of a users group and get your voice heard."

'A good business move'

"IBM, despite its size, cannot take care of everybody. But the things that are of high priority to a variety of companies it will address. It's a good business move to take care of as many people as possible, and I think it was smart to show that," Kramer said.

The intent here is not to focus solely on IBM or Guide and Share. For nearly every important product, be it hardware, software or whatever, there is a users group — though an uninterested user may not know it.

Rather, the issue here is involvement. One voice alone may not draw attention. But many voices joined as one can penetrate the walls of even the biggest company.

> ”
>
> *Perhaps the most significant aspect of the CICS announcement was IBM's explicit acknowledgment of the user input that spawned the changes.*

RACF

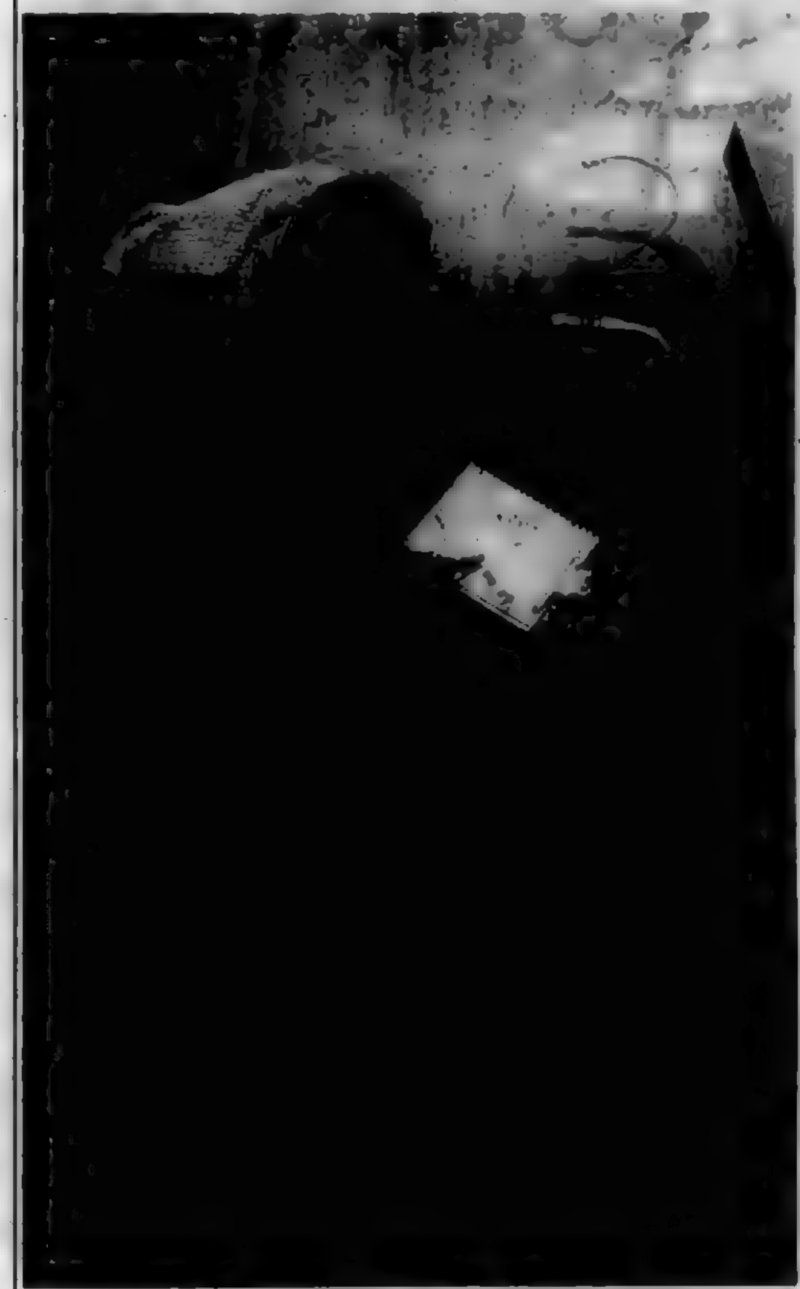
from page 49

the following:

- Expanded RACF/CICS security support.
- The ability to limit user and terminal access to systems by day of week and time of day.
- Real-time security violation notification.
- Tape data set protection and tape bypass label processing protection.
- Authorization checking, installation control and auditability improvements.
- Improved VM and JES2 and JES3 support.

RACF extends the security and auditing capabilities of MVS and VM and supplements security provided by other IBM products including CICS, IMS and DB2. RACF Version 1, Release 7 is slated for availability in December. It has a monthly charge of $841.

More information is available from IBM, White Plains, N.Y. 10604



So you've been put in charge of making sure data flows smoothly to and from your company's remote offices.

You could continue the expensive practice of transmitting strictly by modem. (The phone company would like that very much.)

Or you can cut costs by cutting phone lines.

With Codex's complete line of statistical multiplexers.

You see, what a Codex mux does is take data that used to be transmitted over two, three, even sixteen lines and transmit it over just one. Doing this not only decreases phone line costs, but increases operating efficiency as well.

In fact, a Codex mux can save your company considerable time and money. Even if you're only networking as few as two terminals.

Later, when your needs expand, so can your network. Codex has muxes that can support anywhere from just a few terminals to several hundred. Whether they're graphics terminals, printers, pc's or CRT's.

A Codex applications expert will gladly tell you more about the advantages of taking away your computer's phones.

Get us on the line. For more information, Dial 800-426-1212. Extension 240. Or write Codex Corporation, Dept. 707-240, 20 Cabot Boulevard, Mansfield MA 02048.

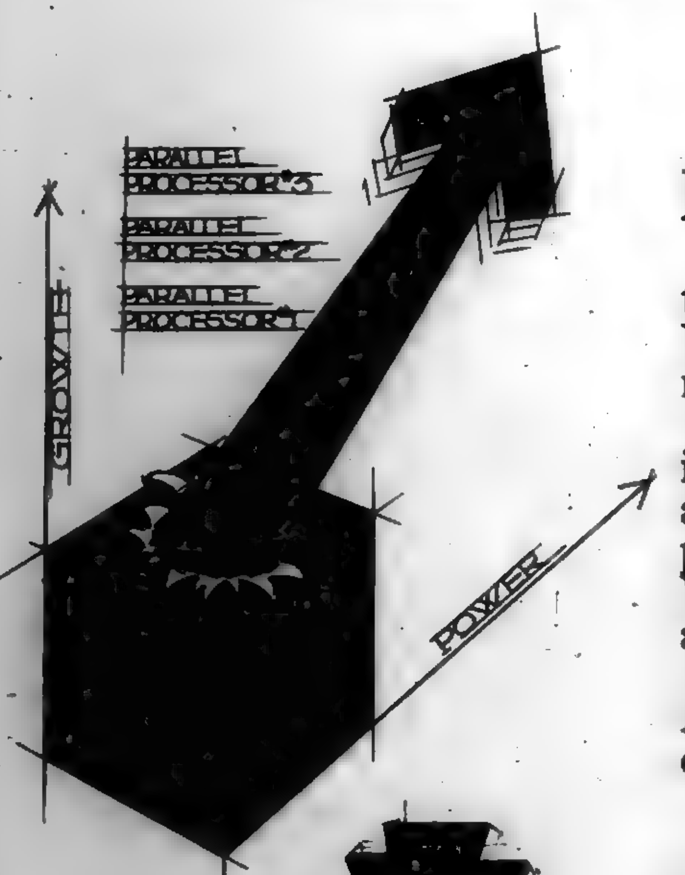
MOTOROLA

See us at the TCA Show, September 17-19.

Parallel Processing. Your Best Computer Investment.



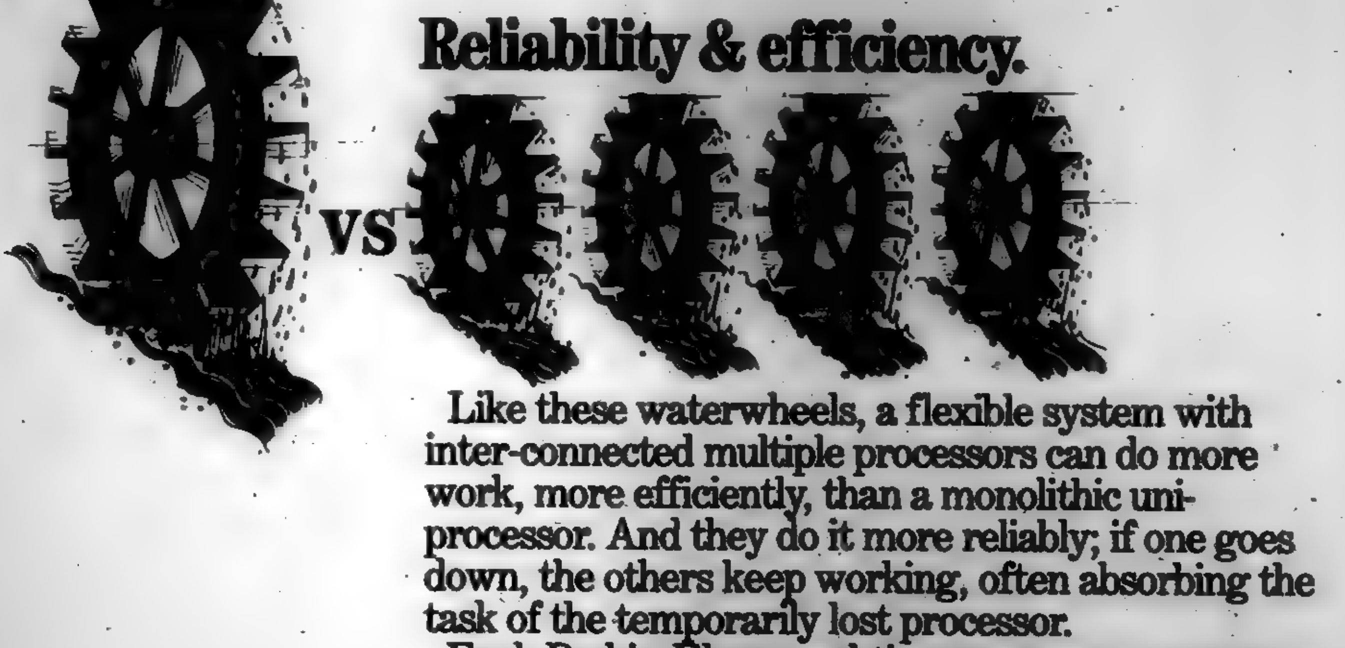
Breaking the performance barrier.

There's no question that uniprocessing has its limitations, particularly when it comes to performance. You can only wring so much power out of a single machine, and no more.

But Perkin-Elmer's Parallel Processing family isn't limited that way. Our unique 32-bit architecture allows you to grow with one high performance processor after another. Easily and economically. Without software changes. Without having to buy an expensive new system.

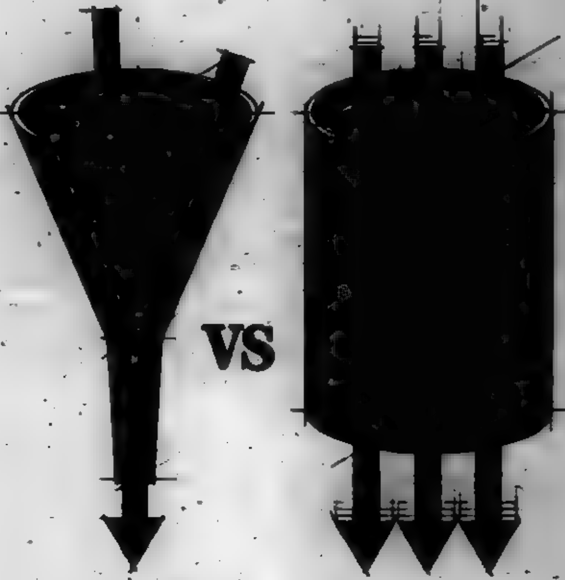
You get all the power and speed you need now. And all you'll need in the future. At a price you can afford.

Reliability & efficiency.



Like these waterwheels, a flexible system with inter-connected multiple processors can do more work, more efficiently, than a monolithic uniprocessor. And they do it more reliably; if one goes down, the others keep working, often absorbing the task of the temporarily lost processor.

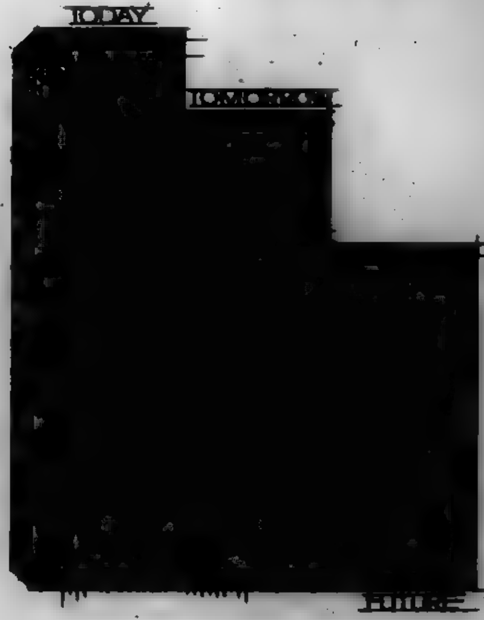
Each Perkin-Elmer real-time processor executes a related segment of your overall task. Simultaneously. So total parallel processing time is far less than sequential uniprocessing of the same task.



Opens the bottleneck.

When you've got many users on a system, all competing for the same limited resources, a uniprocessor can slow to a virtual standstill trying to accommodate all that I/O.

But with a Perkin-Elmer multiprocessing system, each parallel processor can be autonomous, doing its own I/O, sharing memory and resources only when required. So the work keeps flowing.



Growth insurance.

By now you should realize why Perkin-Elmer Parallel Processing is your best computer investment. And like any investment, the real payoff comes in the future.

Across-the-line compatibility and the low cost of adding auxiliary processors make growth painless. Your software investment is protected every step of the way. Even overhead, footprint and operating costs are minimized. That's insurance you can bank on.

Experience to make it work.

All of a sudden, everybody is trying to jump on the Parallel Processing bandwagon. We've been there from the beginning. For over a decade—long before others adopted the technology—Perkin-Elmer computers have been performing Parallel Processing. In versatile shared memory systems. And powerful multiprocessors.

Today there are over 300 Perkin-Elmer Parallel Processing systems installed throughout the world. You can invest in success too. For more information, mail the coupon. Or call toll-free: **1-800-631-2154.**

PERKIN-ELMER
Computers that take
the pain out of growing.

I've been thinking along the same lines.

☐ Send me your 12-page brochure showing how Parallel Processing has worked for other companies.

SOFTWARE & SERVICES

SAS from page 40

batch and interactive processing, allows users to invoke the SAS System directly from the Primary Option Menu of the ISPF Program Development Facility.

First-year license fees cost $8,000 for base SAS software and $4,000 for SAS/DMI software.

More information can be obtained from SAS Institute, Box 8000, SAS Circle, Cary, N.C. 27511.

SYSTEMS SOFTWARE

■ Cosmic, Inc. has announced a set of vector plotting subroutines that runs on Digital Equipment Corp. VAX processors with DEC's VMS operating system.

Longlib consists of a graphics library, an on-line Help library, scan converter programs and command files for installing, creating and testing libraries. The package's features include viewport clipping, graphics input, gray-level and polar plots, three-dimensional plotting and support for hidden line removal.

Longlib produces plots on DEC's VT100, VT125 and VT240; Tektronix, Inc.'s 4010; and Ramtek Corp. 9400 terminals.

Longlib's source code is available for $2,600.

Cosmic, Computer Services Annex, University of Georgia, Athens, Ga. 30602.

■ Executive Technology Data Systems, Inc. has announced a disk management system for the IBM System/34 and 36.

The Disk Space Manager reportedly uses menu-driven operations to identify unused file space and initiate disk management functions. The system can be used to resize files individually or from a system-generated list of files.

The system provides file maintenance functions such as automatic backup of System/36 multiple files on multiple diskettes. It will also generate procedures to restore multiple files from sets of diskettes.

The Disk Space Manager is priced at $395 for a perpetual single-system license.

Executive Technology Data Systems, Suite 108, 28104 Orchard Lake Road, Farmington Hills, Mich. 48018.

■ CHI/COR Information Management, Inc. has announced enhancements to its Data Set Analysis System (Dsas) and its Resource Analysis System (RAS) for IBM mainframes under MVS, MVS/XA or VS-1.

The software defines critical data sets and computing resources required for processing when primary processing facilities are lost.

The highlights of Release 4 of the two products include support for Type 30 SMF records, which can now be used in addition to or in place of Type 4 and Type 5 SMF records to provide job and step data for RAS and Dsas reports. Also offered is support for 3375 Dasd under which the Job Detail Report and the Dasd reports from the RAS will now recognize and report on such devices.

The RAS and Dsas products cost $4,500 and $6,500 respectively.

CHI/COR Information Management, 10 S. Riverside Plaza, Chicago, Ill. 60606.

APPLICATION PACKAGES

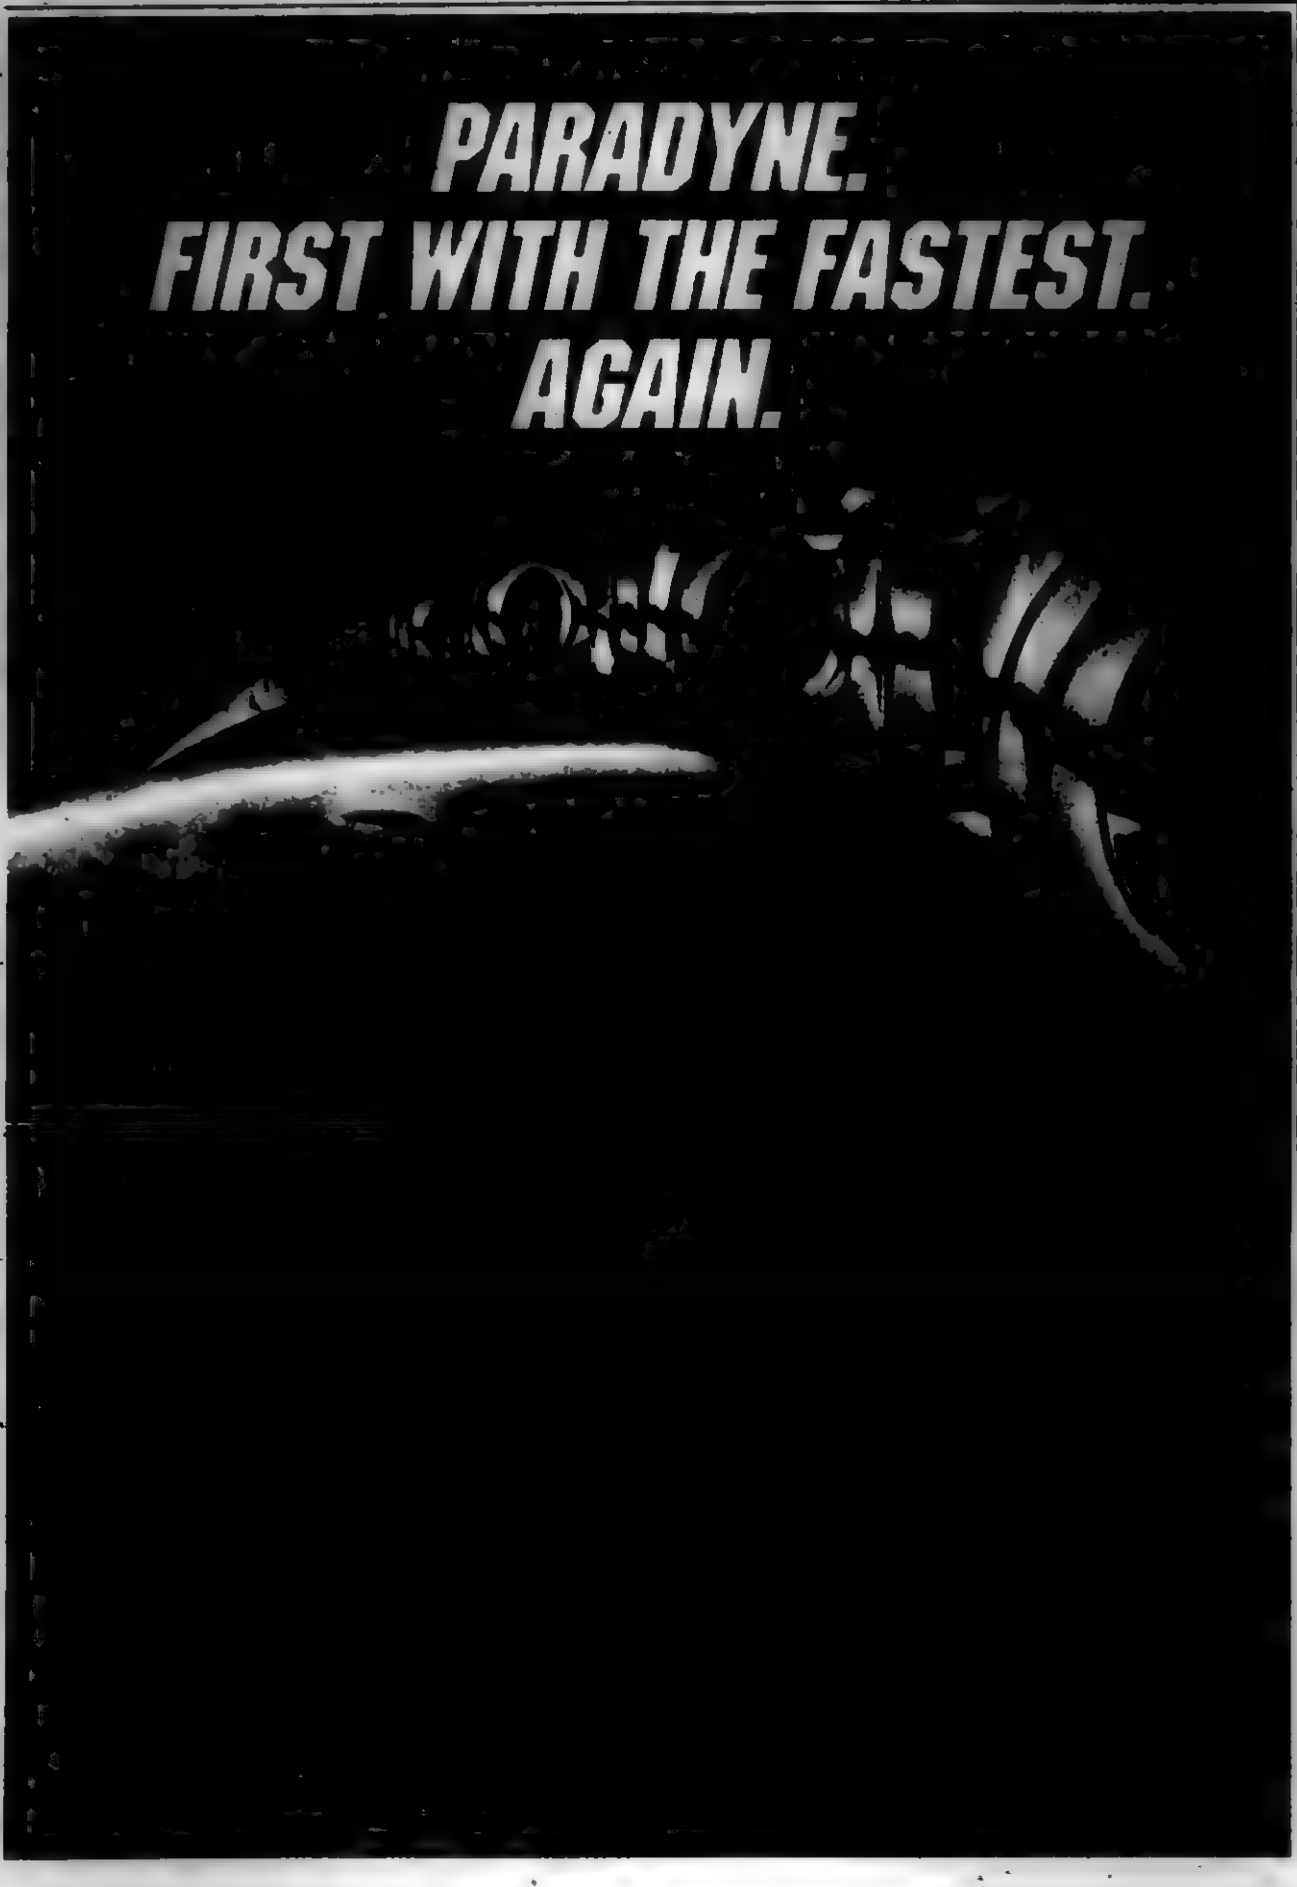
■ Financial reporting capabilities, Help facilities and on-line payroll and foreign currency calculation functions have been added to Sysgen, Inc.'s Release 3 of the 38/Accountant integrated accounting system for the IBM System/38.

The 38/Accountant's Flexlist function reportedly provides control over the horizontal columns on financial statements while retaining vertical control of sequencing and subtotaling. The payroll application has been rewritten to speed processing. A security feature allows managers to grant users access to specific options on selected menus of applications.

Accounts payable, accounts receivable, cash management and fixed assets applications can accept foreign currency transactions after input of currency definitions, a vendor spokesman said.

The entire 38/Accountant Release 3 includes 10 modules and costs $63,500. Modules can be purchased separately.

Sysgen, Suite 120, 3001 Academy Drive, Durham, N.C. 27707.



MICROCOMPUTERS

Lotus clones no bargain, analysts say

By Edward Warner
CW Staff

Two low-cost alternatives to Lotus Development Corp.'s 1-2-3 spreadsheet are being readied for market, but at least two analysts believe the packages will offer little to corporate users.

One of the alternatives, Paperback Software International's VP-Planner, reportedly includes two data base management systems, one of them compatible with Ashton-Tate's Dbase II and Dbase III. It also features a spreadsheet that, in the words of Paperback Software's marketing manager Michael Burdick, "will do the things that 1-2-3 does the same way that 1-2-3 does them."

The other, VIP Technologies Corp.'s VIP Professional, reportedly offers the same keystrokes, macro functions, commands and features as 1-2-3, plus an icon-based user interface.

While the two packages, both available in October, claim many similarities with 1-2-3, they differ in price. The Lotus product lists for $495. By contrast, VP-Planner is priced at $99.95 and VIP Professional at $249.95 for the IBM Personal Computer. A $149.95 version of VIP Professional for the Atari, Inc. Atari ST will be available by the end of August.

Will the corporate market for business software be attracted to new entries because of their price tags? "No," answered analyst Aaron Goldberg, director of microsystems services for market research firm International Data Corp. in Santa Clara, Calif. Goldberg characterized the pricing of the two entries as "a perfect example of consumer theory marketing run amok.

"If I'm an executive," he elaborated, "and my company uses 1-2-3, is it worth a couple hundred bucks [saved] to [fool] around [with a new product]?" To do so, he claimed, would be to risk spending hours fixing a spreadsheet if problems arose.

Analyst Amy Wohl, president of Wohl Associates in Bala-Cynwyd, Pa., agreed.

See CHOICE page 67

IBM offers drawing tool

Kit includes art library, multiple brushes, colors

An IBM Drawing Assistant screen

BOCA RATON, Fla. — IBM has boosted its line of Personal Computer Assistant series software with Drawing Assistant, a graphics package that may be used for drawings, floor plans, charts, diagrams and other illustrations.

The $169 package can produce separate drawings, enhance graphs created with IBM Graphing Assistant or produce graphics that can be merged within IBM Writing Assistant documents, IBM said.

Other features reportedly include an art library containing symbols, maps and patterns and a zoom function that allows any part of a picture to be magnified, retouched and then restored to original size.

Drawing Assistant permits users to select or create patterns, choose different brush styles and paint with two to 16 colors at a time, IBM said.

Simplified drawings of shapes such as circles and rectangles can be created by pointing to a function, selecting it and drawing the shape. The package also supports selective removal of a freshly painted drawing, leaving the original painting underneath untouched, according to the vendor.

The software runs on the IBM Personal Computer, Personal Computer XT, Personal Computer AT, Portable Personal Computer and PCjr. It requires 256K bytes of internal memory and either an IBM color graphics monitor adapter or an IBM enhanced graphics adapter. Use of a mouse and two disk drives is recommended.

More information is available from IBM Entry Systems Division, Boca Raton, Fla. 33432.

No leads in search for Unix PC

SMALL TALK
Edward Warner
CW Senior Writer

Call me the Personal Computer Private Eye. For the past month, I've been on the trail of the AT&T Unix PC. I've seen them on display at trade shows and in one computer store, but when I try to find one in somebody's office, no luck.

In May, I asked AT&T public relations people to give me the names of some users. Saying they were too removed from the actual sale, they sent me a list of three dealers instead. I called the dealers on the list, and with the third I hit pay dirt. Or so I thought.

That dealer was Glen Dardick, the owner of the two-store Computerland Corp. of Richmond, Va., chain. Both of his stores carried the Unix PC. Dardick, a straight-talking sort of guy, said he'd give me the names of Unix PC customers, if the customers agreed to it.

So I staked out Dardick's place via phone, checking in every so often. "Sold any yet?" I'd ask. Nope. Last week, I got the word from Dardick: He'd sent all of his Unix PCs back to AT&T. He hadn't sold one since he took delivery in April. "Multiuser software just [is] not out there," and without software a Unix machine won't sell, he lamented.

I'd reached a dead end. Unsure of

IBM SQL/DS and DB2 relational DBMS now on PC

ORACLE, the relational DBMS compatible with IBM's SQL/DS and DB2, is now available on the IBM PC/XT and PC/AT. While SQL/DS and DB2 run only on IBM mainframes, ORACLE runs on IBM mainframes as well as on DEC, DG, HP and most other minis and micros. Any application written for SQL/DS or DB2 will run without modification on the complete range of systems supporting ORACLE, including PCs.

SQL/DS and DB2 are relational database management systems; ORACLE is a relational DBMS plus an integrated set of 4th generation software tools for application generation, report writing, color graphics and network communications.

Oracle Corporation introduced the first relational DBMS in 1979. Now, ORACLE provides the only complete implementation of the IBM-standard SQL language available for the PC.

Oracle Corporation cites three principal application areas for its product's capabilities:

■ The ORACLE Application Development Center provides a PC-based development center for the creation of DB2 and SQL/DS applications. The flexibility of the personal computing environment is made available to programmers creating applications for use with IBM's relational database products.

■ The ORACLE Personal Information Center extends the Information Center concept to the Personal Computer. ORACLE's application generator, graphics, spreadsheet and other end-user tools provide a SQL/DS and DB2 compatible Information Center on the desktop.

Users can become acquainted with the facilities and power of the Information Center in the personal computing environment, and transfer their knowledge and skills as the MIS Information Center facility evolves. The ORACLE Personal Information Center provides the facilities for MIS to develop the cooperative relationship with end users so vital to the success of the Information Center.

In addition, with ORACLE on departmental superminis, users can create identical Information Centers at the department level.

■ The ORACLE Distributed Information Center provides an intelligent set of communication links among multiple systems, with ORACLE running on IBM mainframes and various minis and PCs.

Using ORACLE's SQL*LINK networking facility, ORACLE on such diverse systems as MVS, VM/CMS, VAX/VMS, UNIX and PC/DOS can selectively exchange database information using the full capabilities of the SQL language. Applications, portable across all environments, can be run identically on any system, and data can be intelligently extracted for use at any site.

ORACLE is currently installed on over 1000 supermini and mainframe systems around the world, as well as on thousands of PCs and compatibles. Oracle's customers include 8 out of the 10 largest U.S. corporations, as well as major foreign companies and many government agencies.

For further information, contact Oracle Corp., Dept. C, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350.

Micropro word processing package targets novice users

By Kathleen Sullivan
CW West Coast Bureau

SAN RAFAEL, Calif. — Setting its sights on the market for novice computer users, Micropro International Corp. recently announced Easy, a $150 word processing package designed for first-time users.

Developed for the IBM Personal Computer and compatible systems, Easy signals Micropro's intent to woo customers away from Software Publishing Corp.'s PFS:Write and IBM's Writing Assistant, which now dominate the market, said H. Glen Haney, Micropro's president.

Designed primarily for small business users, Easy is a menu-driven program that relies extensively on the use of pop-up menus. On-line Help is provided for every command, and Easy includes an Undo command that allows users to restore accidentally deleted text, according to Micropro.

Documents up to 240 columns wide

With Easy, users can create documents up to 240 columns wide. The program is said to provide seven type styles and to feature customized support for more than 120 printers. A 65,000-word spelling checker is included.

> 99
>
> *At its product debut, Micropro emphasized that Easy is not a 'cut-down version of Wordstar' but an entirely new product.*

According to Micropro, Easy users will be able to share files with the firm's two other word processing programs, Wordstar and Wordstar 2000.

Unlike competing products that limit the length of a document, Easy's documents are limited only by the amount of disk storage available. PFS:Write writes to random-access memory (RAM), so a document is limited to available memory.

At its product debut, the company emphasized that Easy is not a "cut-down version of Wordstar" but an entirely new product, written in the Modula-2 programming language.

User interface applauded

Analysts who had received early copies of the program applauded Easy's user interface, saying that the program's design gave it some advantages over products with which it competes.

In a report issued by Wohl Associates, a Bala Cynwd, Pa.-based consulting firm, analyst Amy Wohl and Joel Levy compared Easy and PFS:Write.

The analysts decided that while the products were "roughly comparable from a features point of view," Easy got higher marks in the ease-of-learning category.

"We found that the Easy product, because of its pop-up menu interface and its contextual Help, was particularly simple to learn," they wrote. Wohl and Levy estimated that a new user would be able to master the basic features of the program and begin producing simple documents within 30 to 60 minutes.

"While the functionality would not be adequate for every word processing job, it is more than adequate for new users and casual users," they wrote.

"Since the package is upwardly compatible with a range of more sophisticated Micropro word processing products, users whose needs grow should be able to upgrade without the need to convert their existing library of documents."

Easy also got high marks from International Data Corp.'s Yates Laboratories, a market research and software testing group based in Palo Alto, Calif., which brought three novice users together to compare Easy, PFS:Write and IBM's Writing Assistant.

A Yates report noted that all three programs are "quite simple to learn and use," but added that "an overriding advantage which Easy has over its two competitors is the high level of comfort which the users felt with the program.

"This feeling of comfort makes the new user's first impression of using a computer a rewarding one, rather than a frustration." Yates concluded that Easy has a shorter learning curve than the other products.

Although Micropro said Easy can run on a dual-floppy-drive system, Yates recommended the use of a hard disk with the program. "Easy, in certain functions, seems slow on a two-disk system," the report said. "There is considerable disk activity when moving from menu to menu, and a few editing operations, such as inserting text into a paragraph, lag slightly behind the user."

Easy, which requires 256K bytes of RAM, runs under PC-DOS 2, 2.1, 3 and 3.1.

It will be available late this month, the vendor said.

Additional information is available from Micropro, which is located at 33 San Pablo Ave., San Rafael, Calif. 94903.

Attachmate introduces 3-N-1 adapter

BELLEVUE, Wash. — Attachmate Corp. has announced the Attachmate 3-N-1 3270 Coaxial Adapter, a $1,195 micro-to-mainframe board that offers compatibility with the Digital Communications Associates, Inc. (DCA) Irma board, the IBM 3278/3279 Emulation Adapter and the Multisession Adapter used in the IBM 3270 Personal Computer, according to the vendor.

A company spokesman predicted that IBM soon will offer a variety of software packages for its 3278/3279 Emulation Adapter and the 3270 Personal Computer AT, and emphasized that the Attachmate product is a commitment to the IBM interface standard embodied in those upcoming offerings.

As a single-board adapter for an IBM Personal Computer, Personal Computer XT, AT or compatible, the Attachmate 3-N-1 supports the IBM Type 2 coaxial protocol and the 3270 data stream commands in a CUT or DFT environment.

A range of software

The Attachmate 3-N-1 operates with software currently available for the Irma board and the 3278/3279 Adapter, and it comes with a range of its own software as well.

Features of the Attachmate Operational Software include IBM 3270-PC-compatible file transfer and concurrency.

Software compatible with the 3-N-1 includes DCA's E78 Terminal Emulator and File Transfer packages, Cullinet Software, Inc.'s Goldengate micro-mainframe link, Information Builders, Inc.'s PC/Focus, McCormack & Dodge Corp.'s PC Link and IBM's Professional Office System, PC Connection and 3270 Attachment.

The 3-N-1 fits into a single slot in the Personal Computer and attaches it to IBM 3274 and 3276 control units and 4300 mainframe processors.

The product offers IBM 3287 printer emulation and 3270-PC compatibility in IBM TSO, CMS and CICS environments.

Attachmate is located at 3241 118th S.E., Bellevue, Wash. 98005.

Mega-Omega board debuts

DALLAS — Another vendor cast its lot with the Lotus Development Corp./Intel Corp. Expanded Memory Specification (EMS) in July as Mega-Omega Systems, Inc. introduced its $177 Companion Card, an option board that can be configured to boost the IBM Personal Computer's memory up to 2M bytes, the vendor said.

A 2M-byte version of the Companion Card costs $480.

One main competitor in the EMS arena, Intel's Aboveboard/PC, cost $395 with 64K bytes of memory at its introduction in June. Aboveboard/PC is also said to be expandable to 2M bytes, using additional memory chips sold by Aboveboard dealers at the dealers' prices.

Allows [illegible] micros to address memory

The EMS permits Personal Computers to address memory beyond the 640K-byte limit imposed on the machine by its single-user operating system.

Companion Card reportedly also fills in the Personal Computer's memory below the 640K-byte limit, if required.

Like Aboveboard, the Companion Card will work with Lotus' 1-2-3 and Symphony packages, Ashton-Tate's Framework and other applications software, according to vendor.

With the use of an optional battery backup unit, the Companion Card reportedly can act as a nonvolatile random-access memory disk.

Memory from 0 to 2M bytes

Companion Card is available with zero to 2M bytes of memory and costs $177 to $480, depending on the amount of memory.

Companion Card Plus, a version of the Companion Card with serial, parallel and game ports and a real-time clock, was also introduced.

Companion Card Plus, which uses one option board slot, costs $297 to $600, depending on memory, and is available with zero to 2M bytes of memory.

Mega-Omega Systems is located at Suite 710, LB 122, 5217 Ross Ave., Dallas, Texas 75206.

TI micros get programs, kit

CULVER CITY, Calif. — Ashton-Tate has begun shipments of its Dbase III and Framework programs for the Texas Instruments, Inc. TI Professional line of personal computers, the two vendors have announced.

TI has also announced that it will market a $200 kit to allow users of the TI Professional version of Ashton-Tate's Dbase II to upgrade to Dbase III.

The kit will be available from TI and its authorized resellers, according to the vendors.

Dbase III and Framework for the TI Professional each cost $695.

Ashton-Tate is located at 10150 W. Jefferson Blvd., Culver City, Calif. 90230.

Index Technology enhances Excelerator development tool

CAMBRIDGE, Mass. — Index Technology Corp. has enhanced Excelerator, its automated system development methodology that runs on the IBM Personal Computer line.

The version supports Jackson structure diagrams, entity relationship data model diagrams and Yourdon data flow diagrams. Another capability is a dictionary interface facility that controls locking, unlocking, importing and exporting of project files.

The software's audit trail automatically tracks changes to every dictionary entry. Entity lists keep entity names and types that are logical subsets of a project.

The firm added two graphics enhancements to Excelerator. Level-to-Level Balancing report verifies the conversion of data flow by comparing a graph and all its lower levels. An Explosion report creates a hierarchical table of contents, listing up to nine levels to which objects in a graph can explode.

The release adds 78 ways in which a user can record relationships among entities in a project.

Excelerator costs $8,400.

Index Technology is located at Five Cambridge Center, Cambridge, Mass. 02142.

AST adds video adapter to hardware/software line

IRVINE, Calif. — AST Research, Inc. has announced the addition of the AST-5250/Display video adapter to its Model 11 line of hardware/software packages for communication between IBM Personal Computers and IBM Systems/34, 36 and 38.

The AST-5250/Display board reportedly makes it possible for a Personal Computer to support all IBM 5251 Model 11 terminal character and field display attributes on a standard IBM monochrome monitor.

The single-board AST-5250/Display also reportedly includes a parallel printer port and offers a Hercules Computer Technology, Inc.-compatible graphics display mode. The board is said to be compatible with such packages as Ashton-Tate's Framework and Lotus Development Corp.'s 1-2-3 and Symphony.

The product is said to include the ability to switch automatically from 5251/11 display to IBM PC-DOS display without operator interaction. Also supported are column separators as used in many IBM System/34, 36 and 38 applications.

The AST-5250/Display costs $495.

AST Research is located at 2121 Alton Ave., Irvine, Calif. 92714.

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in over 25 countries is the largest in existence. Over 9,000,000 computer-involved people around the world rely on our publications for the information they need to stay ahead

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diana La Muraglia today if you want to reach the computer buyers in any of the following countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom, Venezuela and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

Multimate products out

EAST HARTFORD, Conn. — Multimate International Corp. has introduced a word processing keyboard and a communications board that includes file conversion utilities to transfer documents between personal computers running its word processing software and Wang Laboratories, Inc. Office Information System, VS and Alliance systems.

The Multimate Business Advantage Keyboard is said to enhance the functionality of Multimate's Professional Word Processor software for IBM Personal Computers. The keyboard has 33 more keys than the IBM keyboard and includes reprogrammed function keys to offer up to four functions per key, the vendor said. It also provides color-coded key labels to remind users of Multimate commands.

Sixteen programmable function keys can be reassigned by the user for macro combinations of Multimate commands.

Sets of function key macros can be created, saved and loaded from the disk for use with different applications or other software.

The Business Advantage Keyboard will be available in October for $345.

Multimate's Business Advantage Communications Board is a dual-function communications board. Its word processing file conversion capabilities reportedly allow bisynchronous transfer of documents between microcomputers using Multimate and Wang dedicated word processors or asynchronous communication with printers, modems and other peripherals.

To transfer files, users can install the communications board in the personal computer and connect it to Wang's communications port directly or through bisynchronous modems and telephone links. File transfer is handled with error-checking capabilities and can conform to Wang's modifications to the IBM 2780 bisynchronous protocol, according to the vendor.

The Business Advantage Communications Board is priced at $995.

Multimate International is located at 52 Oakland Ave. N., East Hartford, Conn. 06108.

Why you should never commit to a database management system without test driving the product.

There's only one way to evaluate the performance of a fourth generation language database management system. Test drive it. Put it to work developing applications for actual problems.

When you do, you'll find that no other 4GL/DBMS can beat NOMAD2. The power and richness of its language let you conquer the toughest applications with ease. And its ability to interface with your existing databases lets you read files as well as write data with barely an effort.

We're willing to run NOMAD2 through whatever obstacle course you care to set up. And against whatever products you select for comparison. Because in a comprehensive test drive situation, not only will NOMAD2 get applications up and running fast, it will leave the competition in the dust.

NOMAD2, which runs on your mainframe or ours, is another step in the NOMAD evolution that began in 1975. For information write Roger Cox, D&B Computing Services,
187 Danbury Rd., Wilton, CT
06897. Or call (203) 762-2511.

Ashton-Tate utility tool debuts

INGLEWOOD, Calif. — Ashton-Tate has introduced a desktop utility program and a file encryption program for the IBM Personal Computer, Personal Computer XT, AT and compatible machines.

Timeframe is a collection of utilities designed to run with Ashton-Tate's Framework integrated software, the vendor said. Designed by Enabling Technologies in Chicago, Timeframe features an appointment book function, calendar, calculator and office assistant capabilities including a directory, letter writer, mail merge and mailing label function. The product is priced at $39.95.

Framelock is a stand-alone program that reportedly will encrypt files that can be read by the Personal Computer or compatibles. It includes two levels of security, password protection and a chain block cipher capability. Framelock requires a minimum memory of 320K bytes and costs $39.95.

Ashton-Tate is located at 8901 S. La Cienega Blvd., Inglewood, Calif. 90301.

Kit lets IBM micro users upgrade to 1-2-3

CAMBRIDGE, Mass. — IBM Personal Computer users of Lotus Development Corp.'s Visicalc spreadsheet package can upgrade to 1-2-3 under an exchange program announced in late July.

Lotus, which acquired the rights to Visicalc through its purchase of Software Arts, Inc., said it will sell $250 exchange kits through its authorized dealers. Visicalc users can buy the kits, complete the enclosed materials and then mail their Visicalc documentation and software to Lotus. They will receive a copy of 1-2-3 via an overnight delivery service, Lotus said.

The exchange program reportedly covers those versions of Visicalc for the Personal Computer marketed by IBM, Software Arts and Visicorp. The 1-2-3 software requires 256K bytes of internal memory, IBM's PC-DOS Version 2 or later and two double-sided, double-density diskette drives or one such drive and a hard-disk storage unit.

Lotus is located at 55 Cambridge Pkwy, Cambridge, Mass. 02142.

Reflex net version out

FREMONT, Calif. — Analytica Corp. has announced a network version of its Reflex data base management software package for the IBM Personal Computer.

The network version, which runs on 3Com Corp. Etherseries networks, is priced at $1,495 per server. Deliveries will begin in September, according to the vendor.

More information is available from Analytica at 3155 Kearney St., Fremont, Calif. 94538.

SOFTWARE

■ STSC, Inc. has enhanced Pocket APL, a version of the APL programming language that runs on the IBM Personal Computer line.

The enhancements include support for larger file sizes, which are now limited only by disk space. Pocket APL features report formatting, error trapping, native and APL shared file systems, online Help and more than 50 system functions, according to STSC.

The package also features an expanded reference guide that includes detailed descriptions and examples of system functions.

The programming language requires 128K bytes of random-access memory.

Pocket APL sells for $95.

STSC, 2115 E. Jefferson St., Rockville, Md. 20852.

See SOFTWARE page 66

The Firebreathers continue on the cutting edge of high performance computers.

The most powerful line of computer systems made. Gould PowerNodes™ and CONCEPT/32s®.

Any way you slice it they beat the VAX.™

Our mainframe PN9000 and CONCEPT 32/97 are up to twice as fast as the VAX 8600.

And even though the mid-range PN6000 and CONCEPT 32/67 are 30-50% smaller then the VAX 11/780, they're still up to three times more powerful.

More power for a slice of the price.

Despite their superior power, our mid-range models cost 40% less than the VAX 11/780. Our mainframes cost about 30% less than the new VAX 8600. The bottom line is more power for less money.

Operating environments that are a cut above the rest.

There's also a choice of system software to consider. Gould's unique UTX/32® is the first operating system to combine UNIX* System V with Berkeley BSD 4.2. So it allows you to access virtually any command format you want whenever you want.

And in real-time environments, Gould's MPX/32™ operating system offers performance that's unmatched in the industry, as well.

Delivery that's right on the mark.

Unlike the VAX 8600, that has up to a 12 month wait for delivery, when you order either a Gould PowerNode or a CONCEPT/32 system, they'll be shipped within 90 days ARO.

You can also be sure with Gould you're getting a computer that's backed by years of experience – the kind of experience we used to develop the first 32-bit real-time computer.

If you need more information or just have a few questions, give us a call at 1-800-327-9716.

See for yourself why VAX no longer cuts it. Go with a Gould computer and ax the VAX.

CONCEPT/32 and UTX/32 are registered trademarks and PowerNode and MPX/32 are trademarks of Gould Inc. VAX is a trademark of Digital Equipment Corp. UNIX is a trademark of AT&T Bell Labs.

GOULD
Electronics

Only Gould computers have a big enough edge to ax the VAX.

■ **Wiley Professional Software has announced a software training program for users of Computer Associates International, Inc.'s Microproducts Division Supercalc 3 Release 2 spreadsheet program on the IBM Personal Computer and Personal Computer XT or AT.**

"Supercalc, The Next Generation," reportedly explains the syntax of all commands and illustrates how to customize text and formulas, move information, manipulate data and print or save the work. The product includes a runtime version of Supercalc 3 that allows users to test its features but does not permit saving or printing data.

The Wiley product requires one 360K-byte disk drive, 128K bytes of memory and the IBM PC-DOS 2 or Microsoft Corp. MS-DOS 2 operating system. The package costs $46.95.

Wiley Professional Software, 605 Third Ave., New York, N.Y. 10158.

■ **Phoenix Computer Products Corp. has announced a macro assembler for microcomputers running Intel Corp.'s 8088, 80186 or 80286 processors and either Microsoft Corp.'s MS-DOS or IBM's PC-DOS operating system.**

Pasm86 is said to transform source code into object code in half the time of Microsoft's assembler. Pasm86 allows users to include local symbols within procedures, define symbols on the command line and obtain listings of error lines only, the vendor said. It can also assemble modules created by the Microsoft product and enables users to include files from any subdirectory by specifying the subdirectory on the command line.

Pasm86 defines relative offsets for each line of source in the first pass and can generate the listing, object and cross-reference file in the second pass. Listings can be generated on the first and second pass or on the second pass only.

Pasm86 is priced at $295.

Phoenix Computer Products, Suite 220, 1416 Providence Highway, Norwood, Mass. 02062.

■ **Texas Instruments, Inc. has announced an architectural design template package that runs on its Professional microcomputer.**

AE/Cadd is a set of template commands used with Autodesk, Inc.'s Autocad software. The template fits over an 11- by 11-in. digitizer tablet and contains common symbols and objects, the vendor said. Rather than continually redrawing a figure, architects can locate a desired shape and insert it into a drawing on their monitors.

AE/Cadd requires 512K bytes of random-access memory, an Intel Corp. 8087 coprocessor, a hard disk drive, color monitor, digitizer tablet and Microsoft Corp.'s MS-DOS operating system.

The package costs $1,000.

TI, Data Systems Group, Department H-802, P.O. Box 809063, Dallas, Texas 75380.

■ **Micrografx, Inc. has announced computer-aided design and drawing software that can run alone on the IBM Personal Computer, Personal Computer XT or AT or in conjunc-**

SEARCH from page 59

what to do next, I pulled the bottle of root beer out of my desk drawer and took a swig. As I was putting the bottle back, my eyes fell on an open *Wall Street Journal*. There I saw my next lead — an ad listing authorized AT&T PC dealers in New York and New England.

I called seven stores, in cities ranging from New York to Danbury, Conn., before I came upon one that was selling the Unix PC. That store, Computerland of Fort Lee, N.J., had sold only a few. Of those few, several had been sold to employees of AT&T itself, according to Paul Allessi, store manager. "People at AT&T have been buying the machines because they can't get them internally," Allessi speculated. But Allessi couldn't give me any names.

I made a few more calls. The score, when I gave up on the list, was seven "No" answers to three "Yes" answers; most AT&T dealers, it appeared, weren't carrying the machine.

In desperation, I called AT&T again. This time, a spokeswoman said she'd have no problem getting back to me with users. Could I give her until Wednesday?

Late on Wednesday, just as I was about to grab my hat and head for home, the phone rang.

"Sorry, but I don't have any users for you yet," she said, adding that she wasn't sure now whether she could ever get me some.

I hung up the phone and did some thinking. Can it be that after five months of selling Unix PCs, AT&T can't name one customer who is currently using the machine?

Sure, they've gotten big orders for Unix Personal Computers from such disparate groups as the Shearson Lehman Brothers, Inc. brokerage firm and the National Catholic Group Purchasing Association, but those orders won't be filled until this fall.

I wanted some users now, while people were still wondering about what impact the machine might have on U.S. business.

If I wanted Unix PC users, I decided, there was only one place left to go for answers. So, readers, do you know of anyone who is using the Unix PC in an office, or evaluating the machine for a possible large purchase? If you do, give me a call at 617 879-0700, extension 538). Please call soon; even the Personal Computer Private Eye can't stay on the case forever.

PRESENTING THE MOS
THAT EVER HAPPENED

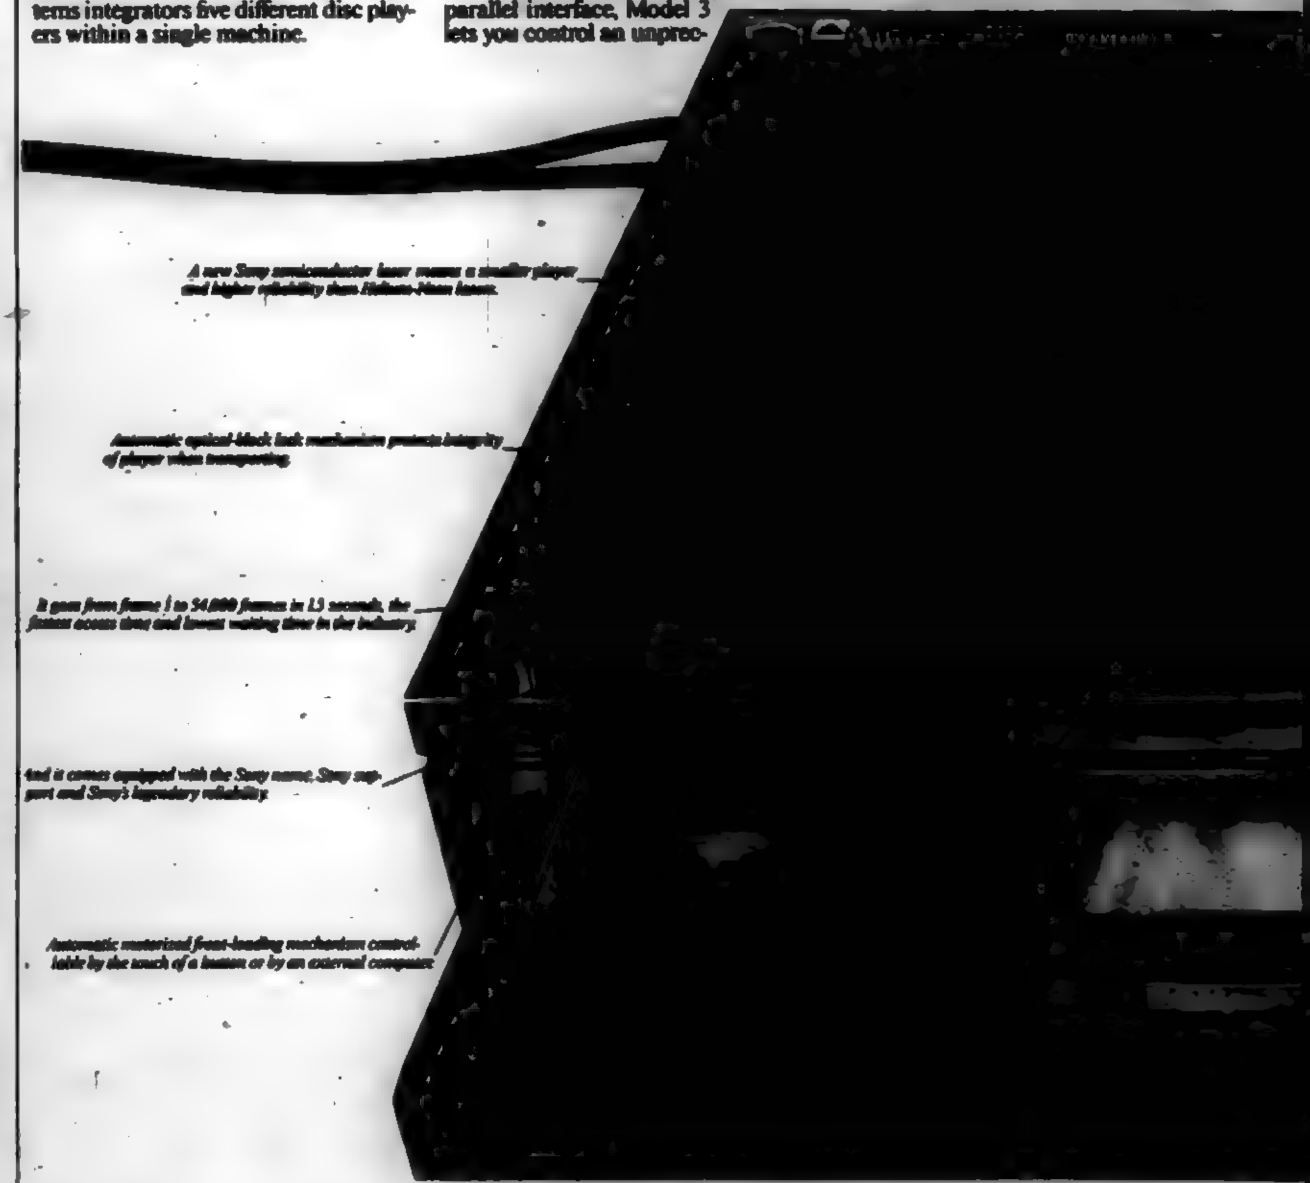
INTRODUCING THE LDP-2000 SYSTEM VIDEO DISC PLAYERS.

In one masterful stroke, Sony has just raised its Intelligent Video™ systems from smart all the way to genius.

We created the LDP-2000, a player for standard LaserVision discs that's so advanced and so flexible, it gives systems integrators five different disc players within a single machine.

Model 1 provides random access audio/video with an RS-232C external computer interface. Add an expansion board, and Model 2 gives you the ability to play discs with audio-track control programs. While if you add a parallel interface, Model 3 lets you control an unprecedented 15 players through one communications bus.

With Model 4, you're equipped with the perfect educational tool: Still Frame Audio. It compresses digital audio so you can extend a program to an



A new Sony semiconductor laser means a smaller player and higher reliability than Helium-Neon lasers.
Automatic optical-block lock mechanism protects integrity of player when transporting.
It goes from frame 1 to 54,000 frames in 1.5 seconds, the fastest access time and lowest waiting time in the industry.
And it comes equipped with the Sony name, Sony support and Sony's legendary reliability.
Automatic motorized front-loading mechanism controllable by the touch of a button or by an external computer.

"The whole problem with inexpensive software products is that they don't allow for proper support," Wohl said. Singling out VP-Planner, she said, "There are real questions about whether you can properly support a package for $99 and have any margin for dealers." No dealers means no local support, she said.

Wohl also expressed what she called mixed emotions about the ability of upstart software publishers to follow a trail blazed at some risk by Lotus. "Somebody did the work to [create] 1-2-3," she said. "If you know what the end result should look like, it's easier to do the programming."

The icon-based VIP Professional reportedly offers users the ability to interact with the software using either their keyboards or an optional mouse. It will interact with those programs that interface with 1-2-3. Versions of the package will eventually be marketed for Apple Computer, Inc. Apple II and Macintosh machines and for computers under the AT&T Unix multiuser operating system, VIP said.

> 'There are real questions about whether you can properly support a package for $99 and have any margin for dealers.'
>
> — Amy Wohl
> Wohl Associates

VP-Planner's templates, macros and worksheets reportedly are all compatible with 1-2-3. The product can work with files imported from the Lotus spreadsheet, Burdick explained, but it cannot export files for use in 1-2-3. That one-way file format compatibility is due, he said, to the fact that 1-2-3 is a subset of VP-Planner, and its compatibility is limited by the features that it offers beyond those of the Lotus product. These features include the ability to print a file in the background while the user works on another spreadsheet.

VP-Planner reportedly can create, read, write, update and join files that are compatible with Dbase II and III. The number of Dbase files that can be open at one time is limited only by disk capacity and the amount of memory available for the worksheet that is accessing those files.

A second data base system included in VP-Planner, the Multidimensional Database, reportedly stores information from worksheets in a data base format that can be used to calculate any combination of totals and subtotals, according to the vendor.

VP-Planner reportedly will be available next month and requires at least 256K bytes of memory, one diskette drive and an 80-col. monitor.

Paperback Software International is headquartered at 2612 Eighth St., Berkeley, Calif. 94710. VIP Technologies is located at 132 Aero Camino, Goleta, Calif. 93117.

T INTELLIGENT THING
TO INTELLIGENT VIDEO.

incredible 15 hours per video disc side.

And in Model 5, you get all of the above plus digital data storage—it's a video disc and floppy disc in one, for creating training programs of unparalleled sophistication.

As your requirements change, you can create any of these configurations with simple internal board changes—not a clutter of cables and boxes.

And the LDP-2000 is more than just the smartest player in the world—it's the fastest. Accessing up to 54,000 frames within 1.5 seconds.

You can plug it right into your interactive video system. Or, you can purchase it as part of the Sony View system, the first complete, totally-integrated image-processing system designed specifically for interactive video.

If you'd like to significantly boost the IQ of your Intelligent Video system, do the only intelligent thing. Contact us at the Sony Information Center at P.O. Box 6185, Union, New Jersey 07083.

tion with Microsoft Corp.'s Windows operating environment.

Inavision reportedly features optional mouse capability, allowing users to choose drawing and editing functions from pull-down menus with a mouse. The software incorporates the Windows capability for simultaneous viewing of multiple screens. Multitasking allows users to edit multiple documents or draw while printing hard copies.

Inavision includes zoom capability for close-up or faraway viewing of the design. Other CAD functions include rotation and scaling.

The software requires a minimum of 320K bytes of memory.

Inavision is priced at $495.

Micrografx, 1820 N. Greenville Ave., Richardson, Texas 75081.

■ **Analytics Communications Systems, Inc. has announced a Data Encryption Standard security package for the IBM Personal Computer line.**

Sherlock Personal Computer Security Module's security features reportedly include encryption and decryption of local files, secure local signon, key management, verification of communicated messages and approval for program change controls.

The package is available in two models: an asynchronous version that does not require an adapter and a bus-level peripheral.

The bus-level model sells for $1,065, and the asynchronous version costs $1,150.

Analytics Communications Systems, 1820 Michael Faraday Drive, Reston, Va. 22090.

■ **Ozz Networking Systems has introduced Ozzpoint/Management System, a sales support data base program for use with the IBM Personal Computer and machines under Datapoint Corp.'s DOS or Resource Management System.**

The software reportedly permits the sorting of the data base by Zip codes and includes statistical analysis capability for use in measuring the effectiveness of advertising campaigns.

Ozzpoint/Management System is priced at $99.95, according to the vendor.

Ozz Networking Systems, Suite 216, 6309 N. O'Connor Road, Irving, Texas 75039.

Matt's office has been winning a lot of new business lately. And it's really not much of a secret.

Because he and his co-workers have been able to make more efficient use of their resources. How? Well, Matt brought in Team Xerox.

Which includes Xerox 8010 Star

"I heard you underbid us by half a million. What's your secret?"

Workstations, high speed laser printers, file servers for organizing and storing data and communications servers for accessing mainframe data bases, all linked together with a Xerox Communications Network. For complex analytical tasks, Xerox also included a Xerox Artificial Intelligence System.

So Matt (and the people in his domestic and international offices) could create, access, share and react to information more quickly and more easily than ever before.

And since Matt's office has become so much more productive, he was able to cut costs—and enter a bid that was $500,000 less than anyone else's.

To make Matt's secret yours, call Team Xerox at 1-800-833-2323, ext. 42 or send your business card to Xerox Corp., Dept. 42013, P.O. Box 24, Rochester, NY 14292.

Net control offers opportunity

WIRE TAP
Paul Korzeniowski
CW Senior Writer

How does one spell opportunity? How about N-E-T-W-O-R-K-M-A-N-A-G-E-M-E-N-T?

The divestiture of AT&T and the growing importance of networks to businesses, large and small, have created a number of opportunities for corporations, individuals and vendors.

Corporations have the opportunity to reign in network control, which in many cases is running wild. Before divestiture, AT&T was responsible for locating glitches in a communications line. On Jan. 1, 1984, responsibility for a line became clouded as AT&T and its former operating companies began finger pointing rather than troubleshooting. Call one firm with a problem, and it will point to another as the source.

The easiest way for a corporation to stop this nonsense is by performing its own network management. Beside enabling network operators to right some problems themselves, the packages help pinpoint telephone company trouble spots, reducing the runaround.

When taking network management into their own hands, companies should carefully examine existing network designs. Divestiture, the growing number of personal computers accessing larger systems and technical advances may have rendered designs from a few years ago obsolete.

Some larger companies are starting all over again. McDonnell Douglas Corp. in St. Louis has replaced a Centrex and

Network supports IBM 3270

By John Dix
CW Staff

Although most local networks do not provide the flexibility and availability associated with wiring systems like IBM's Cabling System, some networks can be used as viable alternatives to hardwiring terminals.

Ungermann-Bass, Inc.'s recently announced ability to support IBM 3270-type traffic, for example, makes its Net/One local network much more attractive. Companies that already have Net/Ones installed can add 3270 support for roughly $1,000 per terminal, a price that includes the cost of supporting the controller.

That price is reasonable given the high cost — often several hundred dollars — of rewiring point-to-point coaxial cables each time 3270-type terminals and printers are moved.

This Ungermann-Bass capability is made possible with two new interfaces, the Network Interface Unit Model 74 (NIU-74) and Network Interface Unit Model 78 (NIU-78). These units reportedly work with both the baseband and broadband implementations of Net/One

Globenet enters pact with SBN

By John Dix
CW Staff

CHICAGO — Satellite Broadcast Network, Inc. (SBN) and Globenet have entered a joint marketing agreement to push a hybrid, two-way communications system that links SBN's satellite data transmission capability with Globenet's packet-switching network.

The digital service combines a point-to-multipoint, host-to-workstation satellite connection with a return terminal-to-host packet net connection. It is intended for companies that need to transmit the bulk of their traffic outbound, as in data distribution or the updating of remote data bases, and is said to cost half that of AT&T multidrop lines.

SBN is a 3-year-old company that markets a demodulator enabling consumers who have C-band receive-only satellite antennas to tap the company's Agribusiness or general business data bases. Both data bases are procured by SBN from Agridata Resources, Inc., a firm that specializes in agricultural news, market data and other information such as major U.S. Department of Agriculture reports, according to Frank Yurasek, vice-president of marketing.

Globenet was incorporated 1¼ years ago to resell the packet-switching services of GTE Telenet Communications Corp., Tymnet, Inc. and Uninet, Inc. According to Jacob Kuykendall, Globenet chief executive officer and president, having access to all three carriers enables Globenet to pick and choose the lowest costs and use the networks to back up each other.

As a reseller, Globenet can combine carrier facilities to realize savings, whereas

Sytek system allows operators to monitor broadband activity

MOUNTAIN VIEW, Calif. — Sytek, Inc. has introduced a network management system that enables operators to monitor activity on moderate to large implementations of the firm's broadband local-area nets.

The Sytek 6101 Network Control Center, an upwardly compatible replacement for the Sytek 50/100 NCC, enables managers of the company's Localnet products to set parameters such as transmission speed and parity for each remote network device. The system is menu driven and can work with two to 1,000 devices.

Two optional software capabilities include the digital monitor option, which provides the means to collect data from up to five Sytek Statistical Monitors — used to gather information from the network — and sends the data to a hard disk or a printer port for analysis and report generation; and the queue server option, which queues users when network resources are busy.

The Sytek 6101 Network Control Center is based on an NCR Corp. Tower supermicro that uses a Motorola, Inc. 68010 microprocessor and AT&T's Unix System V operating system. A base unit includes 1M byte of random-access memory (RAM), a 46M-byte hard disk drive, 5¼-in. floppy disk drive with a 1M-byte capacity and a cartridge tape drive that can store 45M bytes of data.

In the event of a power failure, data is automatically stored in battery-supported RAM for up to four hours. The processing unit automatically restarts upon power restoration. The product's central call routing facility enables a user to be connected to a proper device automatically or by an operator.

An eight-port model sells for $28,950, and a 16-port device costs $31,750. The digital monitor option retails for $1,600, and the queue server option is priced at $2,500.

Sytek is located at 1225 Charleston Road, Mountain View, Calif. 94039.

Sun Microsystems unleashes gateway, software, connector

MOUNTAIN VIEW, Calif. — Sun Microsystems, Inc. has announced communications products that connect Sun workstations to IBM mainframes and compatibles and enable Ethernet local nets to be linked over wide areas.

The Sunlink SNA 3270 is a gateway that enables Sun workstations on an Ethernet network to access IBM Systems Network Architecture (SNA) hosts.

The gateway supports up to 24 simultaneous sessions that can be dynamically allocated.

The product's windowing capability reportedly enables users to create a number of SNA windows and to run numerous sessions concurrently. With a mouse, users can switch between SNA and AT&T Unix applications, the company reported. Users can view data, capture the data to disk or print it anywhere on a Sun Ethernet using IBM 3287 printer emulation.

Sunlink Binary Synchronous Communications (BSC) RJE software is said to provide a bridge between Sun workstations and IBM RJE systems. A user can exchange files and execute remote programs with systems that use IBM's 2780, 3780 or Hasp protocols, according to the company.

Sunlink's Internetwork Router can be used to connect two or more Ethernet networks by lease line, dial-up or satellite connections. The Internetwork Router supports data rates up to 9.6K bit/sec. by itself; when supplemented with Sun's Sunlink Communication Processor, an optional board for the gateway processor, speeds up to 64K bit/sec. are possible, according to the vendor.

Sunlink SNA 3270 costs $2,000, Sunlink BSC RJE software sells for $1,500, and Sunlink Internetwork Router is priced at $2,000, the vendor said.

For additional information, Sun Microsystems is headquartered at 2550 Garcia Ave., Mountain View, Calif. 94043.

NET/ONE

from page 71

over any media. The system supports IBM's Systems Network Architecture (SNA) and Binary Synchronous Communications protocols.

IBM 3274 controllers are attached to a Net/One by wiring directly to a 16-port NIU-74. Eight-port terminal network interface units can be located anywhere on the network and support, through direct coaxial cable connections, IBM 3178, 3278, 3179, 3279, 3180, ITT Courier 1178 and Telex 078 display terminals.

Additionally, NIU-78s support the IBM 3270 Personal Computer in control unit terminal mode and personal computers when outfitted with the IBM Personal Computer 3278/3279 Emulation Adapter, Digital Communications Associates, Inc.'s Irma board or Forte Communications, Inc.'s Forte board.

The NIU-74s and NIU-78s are designed to support the 2.3M bit/sec. speeds associated with IBM's Type A coaxial-cable-attached 3270 devices. Because, however, both Net/One implementations use the carrier-sense multiple access method, network loading is critical to net performance and terminal response time.

Ungermann-Bass calculated the maximum number of devices that could be supported based on desired performance criteria, according to product manager Charles Feltman.

One such consideration was the permissible lag time between when a character was struck on the keyboard and when it appeared on the screen. The NIU-74's and NIU-78's response time was designed never to let the screen fall more than two characters behind the struck character, which is as good or better than IBM's response time, Feltman said.

Based on response time parameters, baseband implementations of Net/One, loaded to no more than 80% of capacity, can support 2,700 devices per net segment. Broadband implementations, loaded to a maximum of 50% capacity, can support 820 devices per channel, or a total of 4,100 devices on the network's five channels. The broadband version operates at 5M bit/sec. while all other implementations operate at 10M bit/sec. These figures presuppose that the 3270 devices are the only ones on the network. Users who already have partially loaded networks will not be able to support as many devices.

To support more terminal devices, networks can be bridged or, in the case of baseband versions, net segments can be interconnected with repeaters. With broadband implementations, the terminals or printers that are supported can be up to five cable miles away from the controller.

Both the local and remote versions of IBM's 3274 controllers are supported. But, more important, because terminals can be located so far from CPUs, users can pull remote controllers back to the machine room and locally attach them, thus vastly improving terminal response time.

Any peripheral device supported on a NIU-78 can access any NIU-74 port on the network. The system also reportedly offers a port rotoring capability that enables terminals to contend for controller ports. This is said to reduce the number of required controllers because terminal users can queue for ports.

Obviously, companies that don't have Net/Ones installed will be less inclined to purchase the system just to support IBM terminal gear. IBM's Cabling System provides greater availability — a data outlet in every office — and will be used as the foundation for the company's forthcoming token local-area network. For users with Net/Ones installed, the NIU-74 and NIU-78s do, however, provide workable options to hard-wiring IBM terminals.

MANAGE

from page 72

satellite communications system with a $58 million network driven by private branch exchanges. Electronic Data Systems Corp. has begun designing a $350 million network for its owner, General Motors Corp.

These sophisticated networks offer an opportunity to cut network costs. By carefully examining requirements and choosing suitable equipment, companies can increase the proverbial bang for the buck. McDonnell Douglas estimated that its network would save the company $15 million per year.

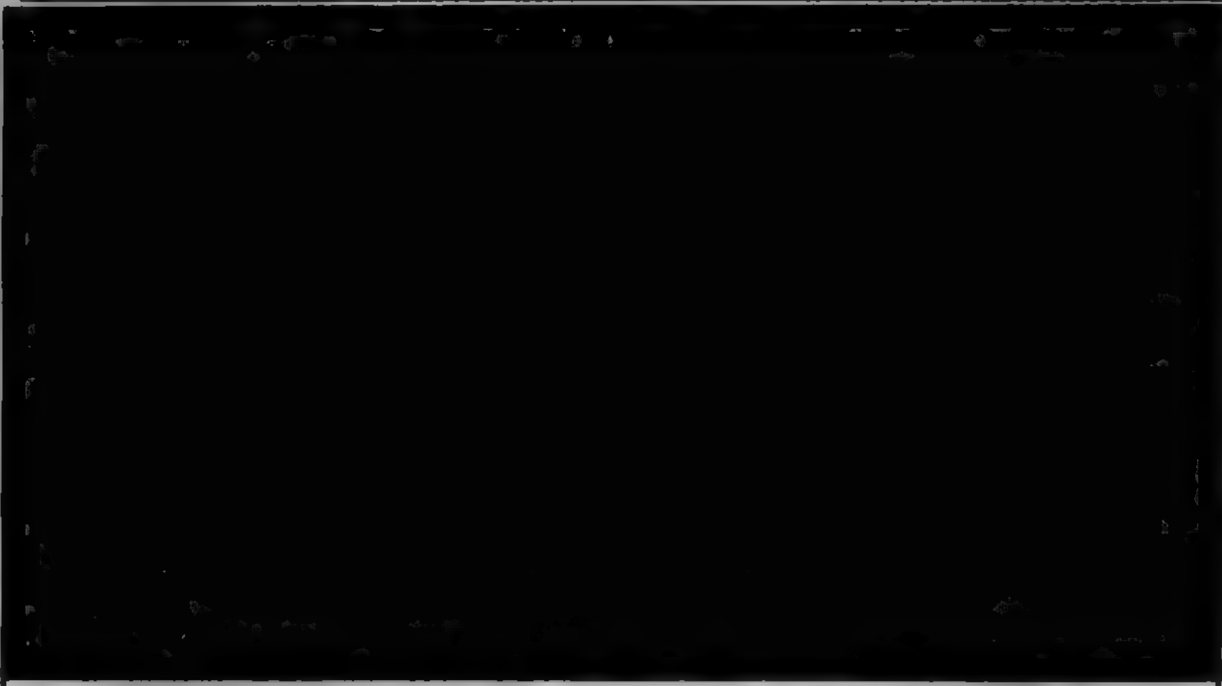
Senior management tends to notice such savings. MIS managers who save a company such large amounts of money are often rewarded financially and with career opportunities.

Network management can also present opportunities to network operators, who are becoming some of the most highly sought after data processing professionals. Network management staffs could mushroom just as microcomputer support centers did a few years ago.

Vendors are presented with an opportunity to turn a healthy profit. Corporations seem ready to invest in these packages but are not sure which system is best. For a few reasons, no network management package dominates the current market.

A great deal of flexibility exists in the manner in which a package could monitor transmissions. Certain firms have looked only to protect their existing markets and not to tap other markets, so their packages work well with only their equipment.

A more serious problem is that none of the systems provide comprehensive evaluation tools. Some are very good at monitoring the data that goes over the lines; others work well evaluating network connections. There doesn't seem to be one package that does both well. Such a package could do for network management what Lotus Development Corp.'s 1-2-3 did for personal computers.



It's more than just a name.

Introducing Sperry CUSTOMCARE℠ service. It combines the right people with the right technology to give you fast, personal service.

Sperry has always believed that providing first class customer support is as important as providing first class equipment. And as a result, we have one of the most professional, most sophisticated service organizations in the world.

Now, to further express our dedication to customer service, we are bringing together the total resources of our nationwide services under one name: CUSTOMCARE.

CUSTOMCARE service is more than just a name. It's a total commitment to personalized service on the part of the more than 5000 support personnel who make up the Sperry CUSTOMCARE service team.

They care about your business. They'll take the time to select a service plan that's right for you; a plan that can combine a wide variety of support programs including:

Innovative customer education programs that include both videotaped instruction and specialized seminars at nationwide Sperry Learning Centers…

On site applications, network design and performance analysis expertise; plus readily available centralized technical software assistance…

And a choice of flexible on-site and off-site hardware maintenance options. Plus the new third party services that let you apply the benefits of CUSTOMCARE service to non-Sperry equipment.

Together, we'll find the total service plan that gives you maximum efficiency from your computer and information processing equipment, and maximum value for your service dollar.

With CUSTOMCARE service, you're never standing alone. You're supported by an experienced, dedicated service organization that has been getting the job done for over three decades.

Why the time has never been better to get your own subscription to Computerworld:

FREE CLOCK WITH YOUR SUBSCRIPTION

Subscribe to *Computerworld* now, and we'll send you this miniature, personal computer clock. Free. The clock displays the date, the hour, minute and second, and makes a handsome desk-top piece for your office. And as we said, it's a gift from us to thank you for becoming a new subscriber to *Computerworld*.

51 ISSUES OF *COMPUTERWORLD*

In addition to the free clock, of course, you'll receive 51 issues of *Computerworld*. So you won't have to wait for a co-worker's copy to keep up-to-date on what's taking place in the computer field.

YOU'LL ALSO RECEIVE SPECIAL FOCUS ISSUES

As a *Computerworld* subscriber, you'll also receive our highly-acclaimed COMPUTERWORLD FOCUS issues — at no extra charge. Published once a month (except July and December), these bonus issues focus on a single topic. Here is a sampling: UNIX™, Office Automation, Microcomputer Software, Business Graphics, Applications Software, Manufacturing, Networks, Systems Software, Microcomputer Hardware. COMPUTERWORLD FOCUS helps you plan, purchase, and save money. And these bonus issues are sent only to *Computerworld* subscribers — it's like getting a subscription to a second magazine FREE!

As you can see, there are plenty of reasons to subscribe to *Computerworld*. So don't rely on someone else to lend you theirs. Be well-informed — with 51 issues of *Computerworld* plus the COMPUTERWORLD FOCUS issues — without having to wait.

Now you know why the time has never been better to subscribe to *Computerworld*.

UNIX is a trademark of AT & T Bell Laboratories.

☐ **Yes!** Please send me Computerworld for one year at $39 (that's $5 off the annual subscription rate of $44) plus all 10 COMPUTERWORLD FOCUS issues at no extra charge. I understand that my satisfaction is guaranteed and that I may cancel at any time and request a refund on the unused portion of my subscription.

HYBRID

from page 71

users that want to gateway one net to another will still pay the initial carrier's charges, Kuykendall said.

Combining one-way satellite distribution services with terrestrial packet nets gives the best of both worlds, Kuykendall said. Use of satellites for the heavy host-to-terminal traffic obviates the time and kilocharacter charges associated with packet nets, and the terminal-to-host packet return link enables the service to use error detection and retransmission. Unlike forward error checking, used with some one-way satellite services, this method provides more efficient use of the satellite resources and enables what Kuykendall called virtually error-free transmission — error rates in the 10 to the negative eighth range.

In practice, an insurance company, for example, would tie its headquarters to an SBN earth station with a private line. That facility will broadcast the traffic — via the Ku-band Hughes Galaxy One satellite — at 9.6K bit/sec. to all branch offices, which are outfitted with 1m to 1.2m receive-only antennae.

The antennae are part of a hybrid station management module that is an intelligent device providing error detection. It wakes up upon recognition of its address, autodials a packet net and logs itself on, establishing a return connection to the master earth station. The 1,200 bit/sec. packet link is used for retransmission and other transaction requests.

SBN will strategically locate master earth stations around the country.

Service prices include fixed hardware costs, recurring monthly charges and usage-sensitive rate elements.

On the host side, users can pick up the tab for installing their own master earth station or shoulder a roughly $20,000 charge for shared use of a master facility. The remote hybrid station management modules, which include the antennae, cost roughly $3,500.

Other charges include a $5,000/mo space segment fee for each full time, 24 hour/day, seven day/week 9.6K bit/sec. channel; and packet net charges that vary with use.

Kuykendall said the service is scheduled to be available in late September or early October.

SBN is located at 212 W. Superior St., Chicago, Ill. 60610. Globenet is located at Suite A 1715, 175 W. Jackson Blvd., Chicago, Ill. 60604.

VOICE/DATA COMMUNICATIONS

Gandalf Data, Inc. has announced a network software package for its Pacx 2000 family of private branch exchanges.

The software enables two to 32 data switches to be used as switching nodes in a network that supports up to 20,000 users. The software adds eight levels of security that limit unauthorized use of network resources. A network can reportedly be configured so various users are restricted from accessing specific devices.

Whenever a network map has been programmed into one node, it can be downloaded to other nodes in a system. If a route is not available, the system will automatically route it through an available device.

The software costs $1,000.

Gandalf Data, 1020 S. Noel, Wheeling, Ill. 60090.

SOFTWARE

Orion Software, Inc. has announced automatic dialing equipment and software for the IBM System/34, 36 and 38 minicomputers.

Auto Call Equipment (ACE) reportedly doubles the number of connections per host by using a single port for both data and autodialing. It requires a system that accommodates a bisynchronous protocol, including most IBM minis running Synchronous Data Link Control and the Nokia-Kinex Corp. 208AB or 201C modem or compatibles.

ACE supports Orion's ACE/3X software and Network Orion electronic mail system. ACE/3X is a utility program that allows users to issue programmed calls in an ACE-compatible format. It also enables ACE to return to the user program status codes in the event of call failure.

ACE is priced at $1,295 and ACE/3X software costs $625.

Orion Software, 222 Third St., Cambridge, Mass. 02142.

MULTIPLEXERS/MODEMS

Complex Systems, Inc. has announced a time-division multiplexer that works with 56K bit/sec. Digital Dataphone Service or private lines.

TDM 56, a synchronous multiplexer, has six ports that support data at speeds from 2,400 to 19.2K bit/sec. The ports can be configured in eight ways, two examples being five 9.6K bit/sec. ports and one 4.8K bit/sec. port or two 19.2K bit/sec. ports, two 9.6K bit/sec. ports and two 2,400 bit/sec. ports.

A user can select speeds and set up parameters by using a front-panel display. Configuration changes at one end of a link will be automatically made on the other end. Parameters are stored in nonvolatile random-access memory.

The product transmits EIA signals for support of tail circuits and end-to-end signaling. Local and remote loopback tests can be made for each channel and initiated either locally or remotely.

TDM 56K costs $1,395.

Complex Systems, 4930 Research Drive, Huntsville, Ala. 35805.

Not long ago, *PC Magazine* called MDBS III "The most complete and flexible data base management system available for microcomputers." That's a powerful statement. But then, MDBS III is an amazingly powerful software package. So powerful, in fact, that it lets you build mainframe-quality application systems on your micro or mini. MDBS III is not for beginners. It's for application developers with large data bases or complex data interrelationships who want to define data base structures in the most natural way—without resorting to redundancy or artificial constructs. It's for professionals who can appreciate its extensive data security and integrity features, transaction logging, ad hoc query and report writing capability and its ability to serve multiple simultaneous users. And if you want the power and the glory that only the world's most advanced data management system can provide, MDBS III is for you. For information on MDBS III and our professional consulting services, write or call Micro Data Base Systems, Inc., MDBS/Application Development Products, 85 West Algonquin Road, Suite 400, Arlington Heights, IL 60005. (800) 323-3629, or (312) 981-9200. **MDBS III. ABSOLUTE POWER.**

WE'LL GIVE YOU THE POWER.
YOU TAKE THE GLORY.

SYSTEMS & PERIPHERALS

Prime to market plotters

NATICK, Mass. — Prime Computer, Inc. has announced that it will market three California Computer Products, Inc. plotters as enhancements to its line of computer-aided design and manufacturing workstations and terminals. The company also enhanced its PW150 graphics terminal.

The Calcomp plotters are integrated with Prime's Medusa two- and three-dimensional solid modeling software; Crown Software Systems, Inc.'s Sammie human factors 3-D interactive software system; and Ford Motor Co.'s Product Design Graphic System CAD system for curved body surfaces.

The Calcomp Model 1044 is a low-end plotter with eight pens and cut sheet and continuous roll plotting. The unit costs $13,800.

The four-pen Calcomp Model 1077 also allows for cut sheet and continuous roll plotting. It costs $29,900. The top-of-the-line Model 5744 is an electrostatic plotter capable of displaying 400 dot/in. plotting density. It costs $69,500.

Prime also announced its PW153 graphics terminal, an enhanced version of its PW150 graphics terminal. Added features include shaded viewing and an increase from four to 16 colors. The PW153 costs $18,750 singly, with additional terminals costing $15,000.

Prime is located in Prime Park, Natick, Mass. 01760.

Design system offers VAX link

ANAHEIM, Calif. — California Computer Products, Inc. has released an AT&T Unix-based computer-aided design system said to meet the design and drafting requirements of the architectural, engineering and construction markets. The distributed processing system can be connected directly to Digital Equipment Corp. VAX series computers.

The System 25 has a 32-bit applications processing unit and a picture processor that uses a series of separate microprocessors to perform all display processing.

Capabilities include Ethernet local-area networking ability and Multibus interface technology. A basic System 25 includes two displays, a 12-in. monitor and a graphics screen. Also included is a keyboard, a joystick, a digitizer table and stylus, a 30M-byte disk drive and a 1M-byte floppy-disk unit for data backup. The basic system costs $65,000.

Calcomp is located at 2411 W. La Palma Ave., Anaheim, Calif. 92801.

Wang desktop laser printer out

LOWELL, Mass. — Wang Laboratories, Inc. has released a desktop laser printer for its VS systems and Office Information System machines.

The LPS8 is said to provide letter-quality output at up to 8 page/min. It supports multiple font styles on a single page and can print on transparencies and 3- by 5-in. cards.

The desktop laser printer offers both landscape and portrait options for each of the 99 font styles it supports, according to the vendor.

The recommended duty cycle for the LPS8 is 150 page/day or 3,000 page/mo.

The unit costs $5,000.

Standard, signature and customized fonts cost $99; logo fonts cost $199, Wang said.

For additional information, Wang is located at One Industrial Ave., Lowell, Mass. 01851.

Graphics terminals introduced

ACTON, Mass. — CGX Corp. has released a pair of graphics workstations with IBM 5080 compatibility and local three-dimensional capabilities.

The 2033 and 2023 workstations use color raster and vector display technologies, respectively.

The workstations were designed to be used in IBM host-based computer-aided design and manufacturing installations, the vendor said.

The 2033 and 2023 reportedly support Cadam, Inc.'s Cadam and ICP; Dassault Systems' Catia; Structural Dynamics Research Corp.'s Caeds; Bell Northern Research Ltd.'s CBDS; Northrup Corp.'s Ncad; Mathematical Applications Group, Inc.'s Synthavision; and General Motors Corp.'s CGS CAD/CAM software packages running on IBM 370, 4300 and 30 series mainframes.

Features on the 2033 raster and 2023 vector workstations include a local 3-D graphics processor, valuator dials for manipulation of 3-D images and an interface to large-screen projection systems. The 2033 has additional features such as color hard-copy interface and selective pick windowing and visual overlay detection hardware.

The 2023 has 128K bytes of system memory, expandable to 1.1M bytes. The 2033 has 640K bytes of system memory, expandable to 1.1M bytes. Up to 16 workstations can be linked via a CGX 2010 channel unit that monitors the integrity of the system and provides an interface to the IBM mainframe.

The list price of a 2033 color raster workstation is $33,800; the 2023 vector workstation costs $29,700. The 2010 channel unit costs $14,500. Two-dimensional versions of the 2023 and 2033 cost $24,000 $24,500, respectively.

More information can be obtained from CGX at 43 Nagog Park, Acton, Mass. 01720.

Parallel processing — An old idea with new uses, limits

HARD TALK
Tom Henkel
CW Senior Editor

Parallel processing systems seem to be the hot items of the summer. Encore Computer Corp. was touting its Multimax system, based on multiple National Semiconductor Corp. 32032 microprocessors, at last month's National Computer Conference; Intel Corp. just announced the first five recipients of its IPSC concurrent parallel machine; and two weeks ago, Perkin-Elmer Corp. added a mid-range parallel system to its product line with the promise of additional parallel systems in the next few weeks.

Why the sudden flood of parallel machines? Well, the flood really is not all that sudden. The ideas incorporated in parallel processing have been around for years. For example, PE noted it has essentially been in the parallel processing business for about 10 years, pointing to its 7/32 and 8/32 shared memory systems introduced in 1975.

So why are more vendors jumping on the parallel processing bandwagon lately? For one thing, the market for powerful, scientific processing systems seems to be the only bright spot in an otherwise gloomy year for computer vendors.

For a long time, scientific users have been moaning that they needed systems that would allow them to break up complex problems into smaller, more easily manageable pieces for processing. This sort of processing has worked well on multimillion-dollar supercomputers but has been cumbersome on traditional von Neumann architecture processing systems. Now, some clever systems designers have figured a way to develop processors with supercomputer-like qualities which, albeit slower than the Cray Research, Inc. Cray XMP, have a more palatable price tag — in the traditional superminicomputer range.

Economics is another advantage for the parallel machines. It is much less expensive to tie multiple small systems together in such a way that the combined processor complex offers an impressive throughput than it is to develop a powerful uniprocessor to do the same work. The economic advantages become even sweeter when the CPUs connected in a parallel architecture have been around for a while and computer vendors have been able to recoup much of their original R&D costs by selling them as uniprocessors. In fact, one of the big advantages of the Encore and Intel hypercube approach is they use off-the-shelf microprocessor technology. PE too is capitalizing on existing processors in its product lineup. The firm's top-end 3260MPS configuration was based on an existing PE processor, the 3250. Likewise, the company's newest parallel configuration, the 3232MPS, was designed around the 3230MPS.

If the latest round of parallel processors are faster, cheaper and easier to build than their uniprocessor counterparts, the new wave of machines sounds like the perfect deal. But the deal may contain some obstacles. Users switching from a uni-

See PARALLEL page 80

DATA STORAGE

■ **System Industries, Inc. has announced a quick-disconnect feature that has been incorporated into its 9722 and 9733 Winchester storage systems for all Digital Equipment Corp. computers, all Data General Corp. systems and the Hewlett-Packard Co. HP 3000.**

The quick-disconnect housing — for users who need secure sites but wish to use Winchester-type disks — contains the head disk assembly in a slide mount adaptation with a nonremoveable power supply permanently located to one side. One drive can be placed into each of these housings. An operating lever pops the head disk assembly forward so it can be grasped by its carrying handles and removed. A magnetic plunger automatically locks the head disk assembly in place when the drive is powered down and removed.

The quick-disconnect option adds $2,100 to the cost of the drive. The 9722 storage system costs $8,100, and the 9733 costs $11,000.

System Industries, 1855 Barber Lane, Milpitas, Calif. 95035.

TERMINALS

■ **Pericom, Inc. has added two graphics terminals and a screen printer to its product line.**

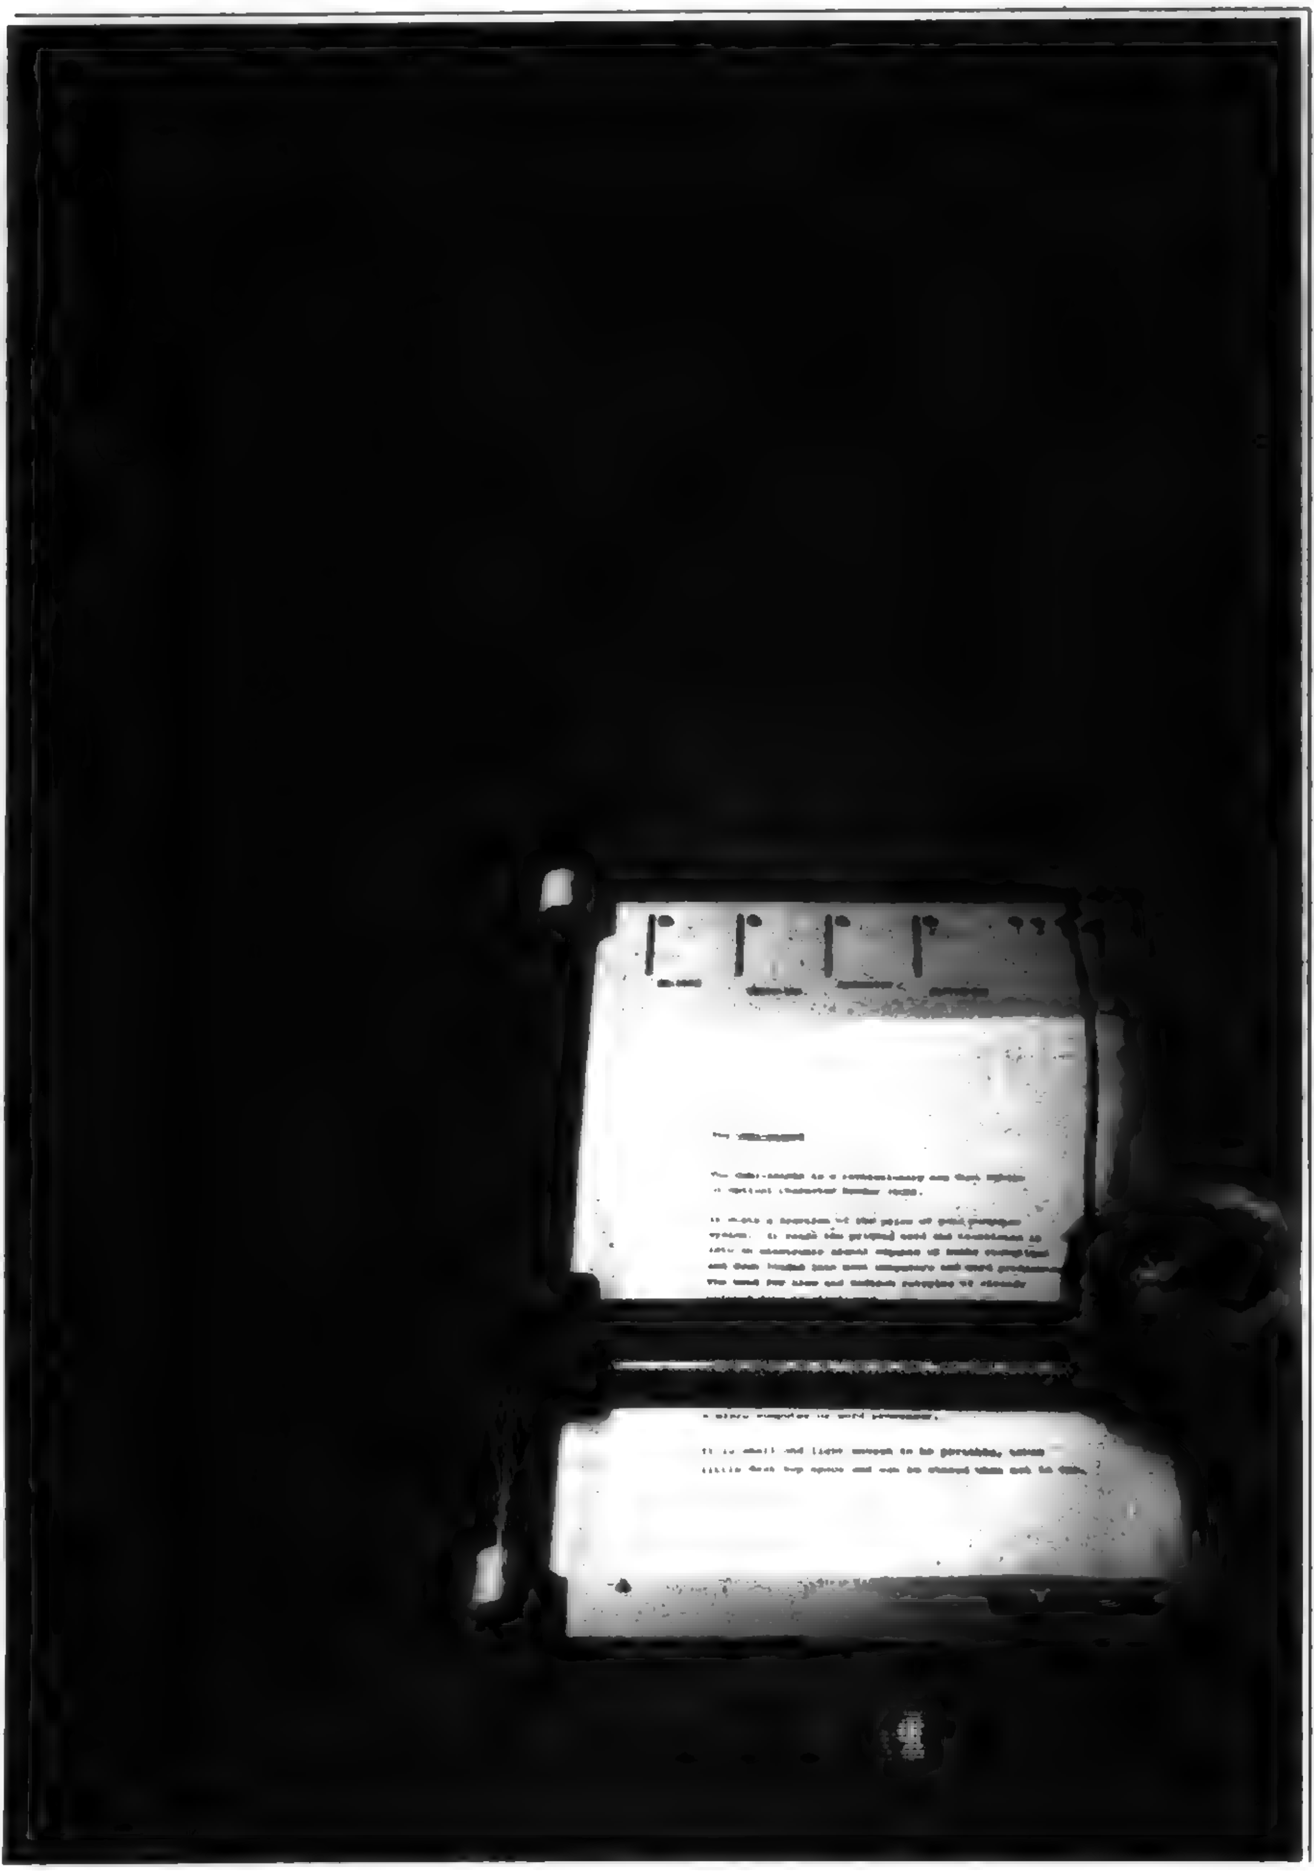
The company's MG-600, a monochrome terminal, includes 1,024- by 780-pixel resolution and in graphics mode is compatible with Digital Equipment Corp.'s VT220 and Tektronix, Inc.'s 4014 terminals. Other features are a 15-in. tilt-and-swivel antiglare monitor, support for a mouse or a digitized tablet, block-mode transmission, short persistence phosphor and support for multiple hosts.

The MD-420 is similar to the MG-600 but uses a 20-in. monitor.

By pressing a button, the Monterey Video Printer prints a screen of data in 12 seconds. The product supplies a resolution of 160 dot/in.

The MG-600 sells for $2,895, the MG-420 is priced at $4,995, and the Monterey Video Printer costs $3,395.

Pericom, Suite 100, 51 Digital Drive, Novato, Calif. 94947.



■ **Westward Technology, Inc. has introduced its Model 2215 desktop monochrome graphics terminal.**

The 15-in. terminal features 1024- by 784-pixel resolution, 57Hz noninterlaced flicker-free screen and an Ascii character set.

The Model 2215 costs $3,995.

Westward Technology, 90 Montvale Ave., Stoneham, Mass. 02180.

PRINTERS/ PLOTTERS

■ **Imagen Corp. has released its Imagestation series of text and graphics laser printers for workstations that run the AT&T Unix operating system, including those of Digital Equipment Corp., Sun Microsystems, Inc. and Apollo Computer, Inc.**

All Imagestation models include emulators for the Epson America, Inc. FX-80, the Diablo Systems, Inc. 630 ECS, the Qume Corp. Sprint 11, the IBM 5152 and the Tektronix, Inc. 4014 printers. The printers have a resolution of 90,000 dot/sq. in. and use dry toner and plain paper. The printers support a variety of document composition systems.

The Executive, intended for text and business graphics, costs $5,950. The Designer — for graphics support — is priced at $6,400. The Innovator, which costs $7,200, was designed for demanding graphics, including computer-aided design and engineering applications.

Imagen, 2674 N. First St., San Jose, Calif. 95134.

GRAPHICS SYSTEMS

■ **Raster Technologies, Inc. has announced an enhancement to its Model One/380 computer graphics system.**

The enhanced 64-bit Model One/380 three-dimensional system is said to provide an integrated rendering pipeline that brings 3-D visualization into a real-time mode. It will provide 64-bit planes of image memory that allow for 24-bit double-buffered true

So the
CEO said,
"If we could automate
all our key departments
and tie them into our
SNA network, we'd
knock the competition
off the map."

And we said…

“Ready for action.”

Information. It's one of the best weapons companies have to knock the competition off the map.

When all the key players in your organization have instant access to the facts they need to make decisions, you have the best chance for top performance and enhanced customer satisfaction.

And that's where Honeywell comes in.

COMPATIBLE DEPARTMENTAL SYSTEMS

Our DPS 6 family of fully compatible computers make excellent departmental systems that can help win the battle on three fronts.

First, we tie headquarters into the action through Honeywell's DSA network architecture or through SNA architecture compatible with IBM hosts. That lets the brass on the corporate level keep track of major developments in the field. We also support another state-of-the-art network, the Local Area Network. Extremely modular, cost-effective and simply connected, Honeywell LANs tie together processors and devices such as PCs, terminals, and computers to fill many basic communications needs.

Next, we give departments the tools they need to plan and execute winning strategies. It's easy because DPS 6 systems are versatile. So your sales and marketing offices can have just the systems and applications they need while accounting and purchasing have theirs. All able to communicate instantly. Honeywell gives you all this without breaking the bank, because all our systems are designed to provide you with a clear growth path that evolves with your needs.

Finally, Honeywell gives the people in the trenches, the end-users, the friendly kinds of software that make the DPS 6 system easily accessible to everyone.

SERVICE AND SUPPORT

When it comes to service, you'll be backed by Honeywell's worldwide TotalCare™ customer service program that is capable of supporting even intercontinental networks. Uptime, after all, is everything, and TotalCare provides everything you need in programs and services that can be tailored to help meet your requirements.

THE SMARTER CHOICE

Helping customers beat the competition is nothing new to us. We're veterans. For more information on Honeywell's departmental system, call 1-800-328-5111, Ext. 2790, or write Honeywell
Information Systems,
200 Smith Street, MS440,
Waltham, MA 02154.

Together, we can find the answers.

Honeywell

color display with 16 bits of depth buffering.

The Model One/380 is available in a desk-side tower enclosure with a 19-in. 60Hz monitor and keyboard. Prices start at $41,500.

Raster Technologies, 9 Executive Park Drive, N. Billerica, Mass. 01862.

POWER SUPPLIES

■ **American Power Conversion Corp. has announced the Model 750RM uninterruptible power source for multiuser processors, computer-aided design and manufacturing systems and communications systems.**

The 750RM provides up to 600W or 750VA of low-distortion power to ac loads of any power factor or wave form. During an extended outage a typical load of 60% can be powered for more than 40 minutes. At full load, the operating time is more than 20 minutes.

The 750RM provides protection from irregularities that account for more than 87% of all power-related problems. The 750RM protects against brownouts, under- and overvoltage, surges, spikes and conducted interference.

Additional features of the 750RM include fully automatic operation, phase-synchronized transfers, low distortion, 90db audible alarm, internal self test at turn on and overtemperature protection.

The 750RM weighs 70lb with battery and is priced at $3,000.

American Power Conversion, 89 Cambridge St., Burlington, Mass. 01803.

■ **Ulveco, Inc. has announced SIS 9310 system, an uninterruptible power supply featuring fault-tolerant parallel redundant power distribution.**

The SIS 9310 system delivers 640W with three redundant supplies of 320W each. The device is mounted in a box measuring 19 in. wide by 16.2 in. deep by 8.7 in. high, configured for mounting in a standard 19-in. rack cabinet. The system can deliver 320W with full redundancy using two modules, the vendor said.

Supervision and control circuitry for load management and current sharing is repeated in each power supply module. One module automatically assumes the master role. Should it fail, another module automatically takes over. Each module is independent and may be removed from the cabinet and replaced without disturbing the load.

The SIS 9310 system is available in the U.S., Japan, Europe and the UK. The product is aimed at voice/data communications applications, as well as broadcasting and civilian and military ground stations for communications and satellite links.

The SIS 9310 system costs $1,800 to $2,500 for a three-module system.

Ulveco, 323 Vintage Park Drive, Foster City, Calif. 94404.

CDC, Digicon ink marketing pact

HOUSTON — Control Data Corp. of Minneapolis and Digicon Geophysical Corp. here have signed a three-year value-added remarketing agreement whereby Digicon will enhance its Disco seismic software for use on CDC's specially configured Cyber 180 seismic processing system.

The Disco software is used by oil companies, geophysical contractors and universities, according to a spokesman.

Current configurations of the CDC seismic systems are said to have 4T bytes of virtual address space, up to 128M bytes of real memory and variable page sizes from 512 bytes to 65K bytes.

Additional information can be obtained from Digicom at Suite 112, 3701 Kirby Drive, Houston, Texas 77098.

PARALLEL

from page 75

processor to a parallel processor will probably run into some conversion problems because the two systems architectures — even if they are designed around the same operating system, that is, AT&T Unix — are not necessarily compatible. Users can look forward to the possibility of making alterations to applications designed for a uniprocessor to accommodate the parallel processing environment.

Many users will also have to learn to look at program development from a whole new angle.

Number of efficiently functioning units

Then there is the question of how many processors can efficiently function in parallel configurations. Most companies marketing parallel systems will boast of theoretical maximum configurations in excess of 100 processors. In some applications 100 processors may be able to work efficiently.

However in others, some experts said there could be memory contention problems. These problems would render some CPUs in the parallel configuration helpless while waiting for other CPUs to free needed memory.

Most industry experts agree parallel processing will play an important role in the marketplace for the rest of the decade. But like anything else, parallel processing is not a cure-all. There are trade-offs that have to be made and skills that have to be learned to use the systems efficiently.

You could win $1000 in the first international computer-generated art contest

CW Communications, Inc. — the world's leading publisher of computer-related newspapers and magazines — is proud to announce its sponsorship of the very first international computer-generated art contest.

All entries must be computer-generated, mounted, and suitable for display. Entries will be judged primarily on their artistic merit, but execution will also be taken into account. Two prizes will be awarded. The winning individual will receive $1,000 (U.S.). The winning organization will receive a trophy.

Winners will be announced during the First Pan Pacific Computer Conference (in Melbourne, Australia, this September 10-13). All entries will be put on display in a special exhibit at this conference.

Enter today. Send your entry to:
The First Pan Pacific
Computer Art Competition
P.O. Box 212 (11 The Avenue)
Hampton, Victoria; Australia 3188.

Entries must be received by August 23rd

Korean firm testing U.S. micro mart

By Clinton Wilder
CW Staff

A $10 billion South Korean conglomerate has decided to dip its toe into the turbulent waters of the U.S. business microcomputer market.

Although several Korean manufacturers have OEM agreements to assemble U.S. vendors' computers in their offshore plants, the Samsung Group is the first to sell its own systems in the U.S. — but it may not be the last.

"Office automation and information technologies have been identified as the hot area by the Korean government," said Merit Janow, a New York-based Asian development and marketing consultant and a senior fellow at the Hudson Institute, which conducts foreign economic policy research. "Korean companies are very concerned about protectionism and unlikely to declare that they're targeting the U.S., but it goes without saying."

Samsung, already a strong presence in U.S. consumer electronics and CRT computer monitors, used the recent National Computer Conference to launch its first U.S.-marketed business microcomputers through its Samsung Semiconductor & Telecommunications Co. (SST) division. But the company readily admits that its first foray into the U.S. computer market is an experiment.

No intention of making money

"We really don't know what the market will be like, but we decided to try these systems," said Kwang-Hoi Koo, manager of Samsung's computer export section. "We have no intention to make money on them. You could say we're using them to pay our tuition in the U.S. market."

The exported products are an IBM Personal Computer AT-compatible called, simply, the Samsung and the SSM-16, a multiuser supermicro based on the Motorola, Inc. 68000 chip and the AT&T Unix operating system. Samsung has sold the SSM-16 in Korea for two years. Koo said that a recent slowing of demand there prompted the company to expand its horizons — notwithstanding the U.S. micro shakeout. "Even in a downturn, the U.S. market is much better than the Korean," Koo said.

The Korean personal computer market was closed to imports in 1982 and 1983 as the government tried to protect its embryonic market. Significant OA growth potential exists in Korea, but even as the market slowly opens to foreign vendors, it is a tough nut to crack.

"You see businesses side by side, one with a local-area network and one with a mimeograph machine," Janow said. "There are tremendous imbalances. That's a major difference between Korea and Japan. The Japanese economies of scale were first developed to serve their domestic market, while Korea is very much an export-led economy."

Like several other Korean conglomer-

- Datapoint last week said it agreed to a $22.5 million settlement to resolve class action stockholder litigation. The company did not admit to any wrongdoing, and the lion's share of the settlement will be paid by insurance companies/88
- Computer Automation recently agreed to sell off its Commercial Systems division, explaining that it could not provide enough resources to the supplier of distributed data systems/88
- Two top M&D executives recently jumped ship to take the top spots at a smaller company/91

Board decision seen boosting paper profits

STAMFORD, Conn. — In a long-awaited decision that is expected to boost paper profits for many software vendors, the Financial Accounting Standards Board (Fasb) recently announced it had resolved a 2¼-year-old debate over recording software development costs.

Fasb said it has issued Statement 86, "Accounting for the Costs of Computer Software to be Sold, Leased or Otherwise Marketed." However, copies of the full document were not immediately released.

The statement, which is expected to be adopted by the Securities and Exchange Commission (SEC), mandates that software vendors record development costs as expenses in the year incurred until technological feasibility of the product is established, according to a Fasb spokeswoman.

The statement differs from an earlier draft proposal [CW, Sept. 17] in that it clarifies the point at which feasibility is established. According to the revised version, feasibility "is established on completion of a detailed program design or, in its absence, on completion of a working model of the product."

After such feasibility is determined, companies are mandated to capitalize all software production costs, enabling them to spread out the reporting costs over a number of years, thus increasing reported net profits for those companies with substantial production costs.

The earlier draft version would have allowed, in some cases, the capitalization of coding and testing performed prior to completion of a detailed program design or working model.

In hearings before Fasb [CW, May 13], the draft version drew opposing reactions from trade associations representing hardware and software vendors, both of which expressed dissatisfaction with the wording of the draft. The American Electronics Association advocated straight expense

See FASB page 91

Watershed time drawing near

INDUSTRY INSIGHT
Peter Bartolik
CW Senior Editor

Midway through the third calendar quarter, the major computer systems vendors should very soon have a handle on whether or not this year is going to go down as a watershed.

If the trend of the past two quarters continues or worsens, 1985 will not close on a happy note, reflecting at least a significant pause in the industry's breakneck growth pace.

With U.S. sales in a virtual no-growth holding pattern, most vendors have remained profitable from strong sales in Europe and other places. But the general consensus is that European sales tend to slack off in the summer. Also, there has been some early talk that the sales depression experienced over here may soon be duplicated over there.

IBM may be able to weather this quarter with its speeded up shipment schedule of 3090 mainframes and new disk drives, although there are a few skeptics among us who doubt that will be enough to erase the problems generated by slow mid-range systems sales.

Digital Equipment Corp. will probably experience its traditional fourth-quarter-to-first-quarter drop in revenue for the current reporting period, but the company claims it has costs under control. However, analysts have been saying the company has been too slow to cut manufacturing overhead, and a drop in international sales could be a problem.

See TREND page 91

AMD cost-cutting measures extended

SUNNYVALE, Calif. — Advanced Micro Devices, Inc. (AMD) announced last week it will extend its program of reduced pay for executive, managerial and professional personnel and reduced workweeks for other employees to the end of this year.

The semiconductor manufacturer indicated there is no prospect of business improving through the remainder of the year.

In a prepared statement, W. J. Sanders III, AMD's president and chief executive officer, said, "It is clear that market conditions are not improving, and no general upturn in demand this year can be expected.

"There can be no return to a full pay program until sales growth resumes or while losses are increasing," Sanders said.

The company adopted a widespread cost-cutting program June 13 that was scheduled to expire at the end of September.

The company said the extended program will be restructured to ensure equitable distribution of the burden among employees.

Thoughtware bids for DSS company

COCONUT GROVE, Fla. — Exemplifying the current trend of consolidation in the microcomputer software industry, Thoughtware, Inc. announced last week that it is negotiating to acquire Lightyear, Inc. of Santa Clara, Calif.

Thoughtware, a developer of decision support system (DSS), expert system and computer-based training software for the IBM Personal Computer series, offered an undisclosed amount of stock for Lightyear, which also produces DSS.

Thoughtware, based here, also announced that Terry Garnett, Lightyear's president and founder, will join Thoughtware's executive staff with responsibility for product marketing and development.

Lightyear had previously agreed to turn over to Thoughtware the distribution and marketing of its one product line, also called Lightyear.

Thoughtware's product line includes the Thoughtware Management Training Library, Trigger, The Advantage Series and Sell! Sell! Sell! software packages.

Restructuring on horizon in rapidly changing chip mart

OUTSIDE LINES
Bohdan O. Szuprowicz

One of the worst slumps in history has hit the computer and semiconductor industries. What is puzzling to many, however, is the fact that this downturn is taking place during a time when the overall economy is relatively healthy and certainly not in a recession.

Japanese competition, IBM aggressiveness, the strong dollar affecting U.S. exports, excess manufacturing capacity, overcrowding of suppliers, a confusing proliferation of new products, overinvestment in the early 1980s and inability to manage torrid growth rates are all being cited as contributing factors.

We would add to this litany a few other factors that are often left unmentioned by the industry and the trade media. During the last few years a number of research organizations made numerous overoptimistic forecasts of growth in many high-technology sectors. These were often used as bases for launching ventures and products without sufficient market analysis.

There is no question that all the above factors are in some degree responsible for the current plight of the semiconductor and computer industries, but we feel that a major restructuring of these industries is also under way. It is the result, in large measure, of the rapid development of the very large-scale integration (VLSI) microcircuit, increasingly powerful computer-aided engineering (CAE) tools to design and use such complex components and the portability of such advanced technologies.

All this is beginning to happen at a time when the semiconductor industry is undergoing its first VLSI crossover period, switching from the widely used 64K-bit random-access memory (RAM) memory chip to the more powerful 256K-bit RAM devices. The prices for the larger chips are declining even faster than the 35% annual decline experienced with previous memory chip generations.

But this is only part of the story because, while the Japanese already control 92% of the 256K-bit RAM market, U.S., European and Asian competitors are accelerating their programs to introduce 1M-bit RAM microchips. South Korea's Samsung Semiconductor Co., for example, is already advertising 1M-bit RAM products for 1986 delivery and Texas Instruments, Inc. is expected to beat AT&T by bringing out its 1M-bit RAM microchip six months earlier than originally planned. As a result, the 256K-bit RAM chip may end up with a life cycle of only one year instead of the usual four years for a new memory chip generation.

What this means is that a massive "Osborne Computer Corp. syndrome" is overwhelming the industry and end users are reluctant to upgrade their equipment knowing full well that much more powerful and cost-effective devices and systems are just around the corner. This also plays havoc with manufacturers who embarked upon upgrading their products based on 256K-bit RAM microchips only to realize suddenly that their competitors who plan to go directly to 1M-bit microchip-based products will clobber them in the marketplace before they even get a chance to recoup their investments.

It now appears that a short-lived VLSI redesign revolution is leading directly into ultra-large-scale integration (Ulsi), which promises microchips in the 1M-bit-and-over density category. The initial 1M-bit RAM market, projected to be worth a few million dollars in 1986, is expected to skyrocket to about $7 billion in 1992.

As competition intensifies, the 1M-bit RAM chip may be superseded by 4M-bit microchips by 1990, again earlier than originally expected. If that happens 16M-bit products would normally follow about four years later. However, given the enhanced CAE development tools based on the more powerful custom-designed microchips, these may come to market much sooner. Toshiba Ltd. of Japan made it known that it expects to be producing 64M-bit RAM chips by the year 2000 and Tokyo University researchers have already proposed to develop a 100M-bit microchip. Other sources indicate that even 1G-bit memory chips may be possible before the end of the century.

Clearly the VLSI and Ulsi revolutions occurring so close together in an internationally competitive environment will create more, rather than less, stability in the electronics industries. Most high-technology market segments that depend on microchips are due for even more intensified and rapid change and an unprecedented multitude of shakeouts.

Enter the fast-growing computer market in Argentina.

Advertise in CW Communications' Argentinean publication, *Computerworld Argentina,* and reach a burgeoning South American computer community. There are approximately 4,000 general purpose computers installed in Argentina and 8,500 personal computers. Argentina's growing industrial and educational needs insure continued EDP growth in the upcoming years.

Computerworld Argentina is the publication computer professionals rely on, twice each month, for all the latest local developments in hardware, software, services and office automation. It is modeled after its sister publication in the U.S., *Computerworld,* and circulates to more than 6,000 DP professionals throughout Argentina.

CW International Marketing Services makes advertising your products in Argentina, and around the world, easy. We have over 50 publications in more than 25 countries around the world. For more information on our wide range of services, complete the coupon and mail today.

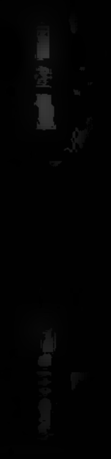
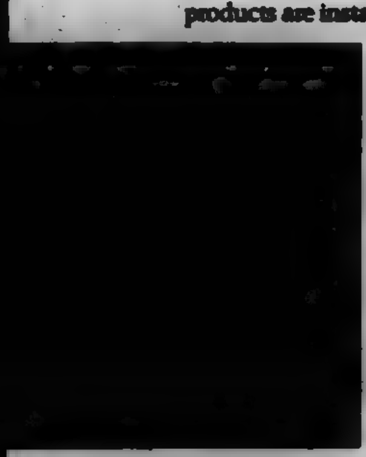
Direct PC to System 34/36/38 Connections Using Standard Twinax Cable



It's Easy With AST-5251/11™: Fast Hookup, File Transfer, Advanced Features & Reliable Operation.

Standard Twinax Cable Support Makes Installation A Snap. It's simple to use your PC just like a standard IBM® 5251/11 terminal—just plug our AST-5251/11 emulation board into your PC/AT/XT, portable or compatible, and connect the standard twinax cable to your IBM System 34/36/38. Over one million AST PC enhancement products are installed worldwide with over 20,000 PC to System 3X connections to date.



File Transfer Is Only The Beginning. With AST-5251/11 you use your PC as always, while concurrently emulating a features-enhanced Model 11 terminal with the ability to transfer files bi-directionally between your host and PC.

Use Your Favorite PC Software. AST's file transfer support not only eliminates the burden and the errors of re-keying, it adds the ability to manipulate transferred data using your favorite PC software packages, like Lotus® 1-2-3™ and WordStar.® And our Hot-Key support lets you conduct concurrent DOS and host sessions, while our applications program interface (API) makes integrating PC and host applications simple.

Even Greater Efficiency. AST-5251/11 also provides host-addressable 5256 printer emulation for your PC printer in a background operational mode.

A Family of Solutions For Your Smart Office. Whether you need AST-5251/11 direct connections, or AST-5250/Display™ full IBM 5251 Model 11 display attributes, Hercules™ graphics compatibility and IBM PC standard monochrome adaptor compatibility, or AST-5251/12™ remote PC to System 34/36/38 connections, all AST micro-to-mini data communications products are strategically focused and developed to support and evolve in concert with the IBM Smart Office architecture. You can count on AST's connections—today and in the future.

See your dealer, or call our Customer Information Center (714) 863-1333 for more information. AST Research, Inc., 2121 Alton Avenue, Irvine, CA 92714 (714) 863-1333 TWX: 753699ASTR UR.

AST-5251/11, AST-5250/Display and AST-5251/12 trademarks of AST Research, Inc. IBM registered trademark of International Business Machines Corp. WordStar registered trademark of MicroPro International Corp. Lotus registered trademark and 1-2-3 trademark of Lotus Development Corp. Hercules trademark of Hercules Computer Technology. Fusion registered trademark of Fusion Products International. DecisionLink trademark of Laguna Laboratories, Inc. The BOSS registered trademark of TenMan Systems, Inc.

KEY FEATURES
- Plugs into PC/XT/AT and compatibles; connects to System 34/36/38 via twinax cable and supports cable thru.
- Emulates 5251-11, 5291, or 5292-1 display terminal.
- Provides host-addressable 5256 printer support (background mode) on PC-attached printer.
- Selectable DMA and I/O interrupt channels.
- Application program interface (API) and bidirectional file transfer included.
- Complete package includes hardware, software, twinax cable assembly, and comprehensive user manuals.
- Supports fixed or hard disk.
- Hot-Key assist for concurrent host and PC sessions.

OUTSTANDING FEATURES
- IBM PSU compatibility (for virtual disk support on the System 34/36/38).
- Third Party Software support, including ASTLink by Fusion,® Laguna Laboratories' DecisionLink™ and The BOSS® by TenMan Systems.
- AST-5250/Display
  - One card solution for standard PC, IBM 5251/11 and bit-mapped monochrome graphics display.
  - Used with AST-5251/11 brings full IBM 5251 Model 11 display attributes to your monochrome display.
  - Includes Hercules compatible high-res bit-mapped graphics capability and parallel port.
  - Automatically switches from 5251/11 display to PC display without operator interaction.

AI specialist sees $5 billion expert systems mart by 1990

By Mitch Betts
CW Washington Bureau

ST. PAUL DE VENCE, France — Business and military applications of expert systems technology will be commercially available in about five years and may constitute a $5 billion market by 1990, according to Atle Fjeld, an artificial intelligence specialist at Sperry Corp.

At a recent press briefing here, Fjeld said Sperry, based in New York, is working on 22 different applications for expert systems, ranging from airline reservations and oil drilling to computer-aided design and battle management.

In the DP operation, expert systems could make large data bases more manageable through the use of smart data dictionaries, he said. Fjeld asserted that the bridge between traditional DP technology and expert systems is data base technology, because an expert system manipulates a knowledge base that is much like a data base.

In the public sector

In the public sector, Fjeld said, the Social Security Administration could reduce its administrative costs by capturing its Social Security eligibility rules in an expert system and then using the system to screen applicants.

In general, he said, expert systems can help business and government managers control information overload, because the system can refine the incoming data and suggest a course of action.

Fjeld said expert systems are most cost-effective when they are applied to management problems that meet the following conditions:

- A difficult problem that already has been solved by an expert.
- Knowledge that can be acquired and represented in the computer.
- A problem that needs to be solved regularly.
- Expertise that is scarce or unevenly distributed.

Sperry management is stressing the importance of this market, Fjeld said, and plans to spend $200 million during the next five years in hopes of capturing 15% to 20% of the world market.

Fjeld is the senior technical manager of Sperry's Knowledge Systems Center in Bloomington, Minn., which employs 150 people. The center, which reports directly to Sperry's chief executive officer, also has established artificial intelligence training centers in Princeton, N.J., and in McLean, Va., and in Birmingham, England.

Sperry's approach to the market is to develop commercially viable systems based on technology developed by other companies, Fjeld said. To this end, Sperry has cooperative agreements to develop systems using Explorer Lisp workstations from Texas Instruments, Inc. [CW, July 15] and expert systems development tools from Intellicorp of Palo Alto, Calif.

Datapoint to settle suits

SAN ANTONIO — Datapoint Corp. announced last week that it has agreed in principle to a $22.5 million settlement of stockholder litigation related to alleged company violations of securities laws.

The alleged violations occurred during a period from Aug. 1, 1980 to May 4, 1982 and resulted in a number of actions that were consolidated into a single class action suit in the U.S. District Court here. A separate derivative suit filed in Delaware was also settled, the company said.

In a prepared statement the company said it agreed to settle the litigation without admitting liability to avoid "the extensive commitment of management time and financial resources required to continue" with a trial.

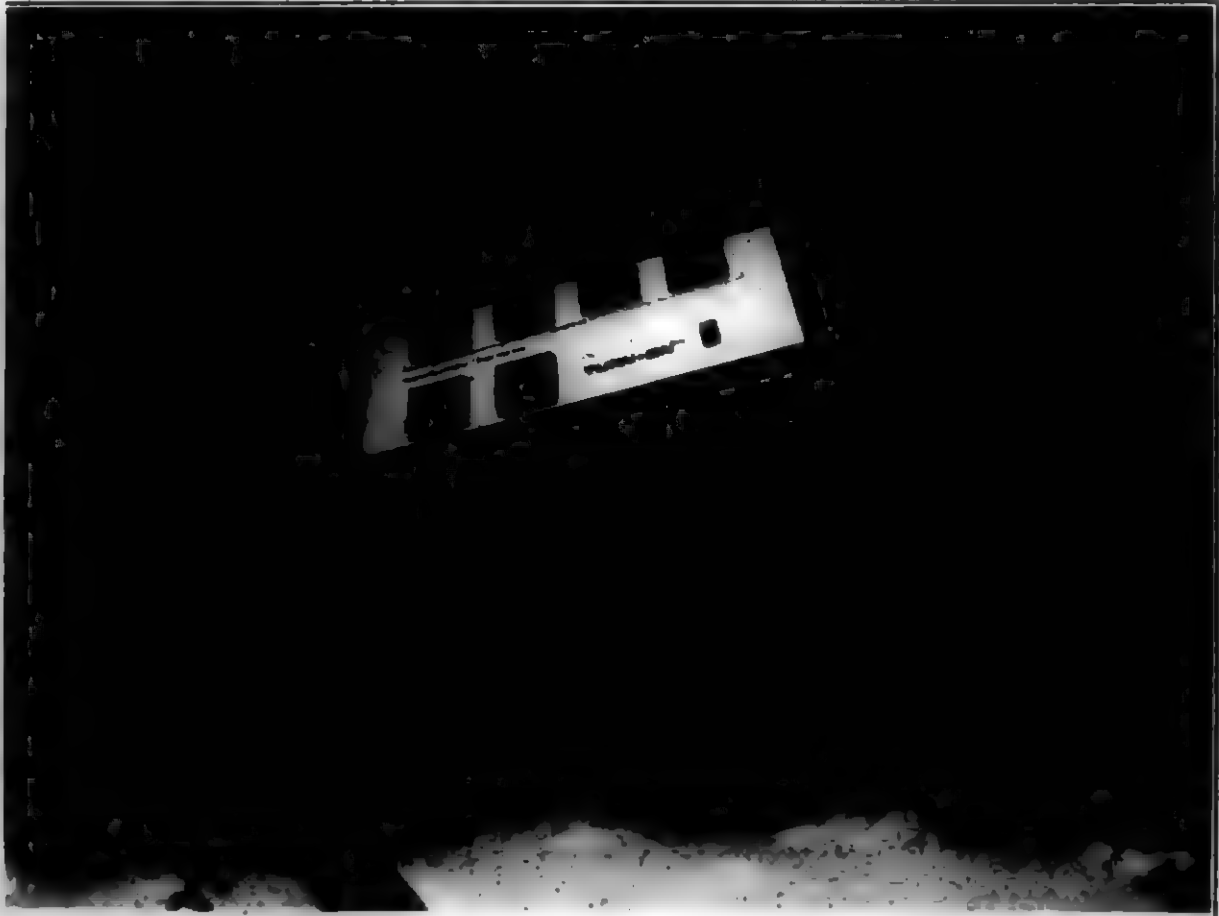
According to the company, its insurers will pay $16 million; $3 million will be paid from an indemnity trust fund established earlier in the year, and $3.5 million will be paid directly by the company.

Sorbus acquires service firm

FRAZER, Pa. — Sorbus, Inc., Bell Atlantic Corp.'s third-party computer maintenance subsidiary, recently acquired Computer Maintenance and Leasing Corp. (CMLC), a Minneapolis-based firm servicing IBM equipment. Terms were not disclosed.

Sorbus Senior Vice-President Michael B. Chamberlain said the acquisition strengthens Sorbus' presence in the IBM third-party maintenance market and adds 350 CMLC customers totaling an annual $3 million in revenue.

The agreement took effect Aug. 1. Sorbus said it will integrate CMLC's field engineering and management employees into its own national work force of 1,500.



Turn on, access, and
turn off your microcomputer.
From anywhere.

PRESENTING TURN-ON™

TURN-ON is a totally unique intelligent power controller that provides unattended remote access plus power protection to your microcomputer. Now you can avoid arranging "call-in" schedules or peak hour overloading. When the phone rings at your powered-down micro, TURN-ON automatically powers-up the peripherals and then the computer, puts your program in operation, and upon completion powers-down the system, leaving a visual signal that remote activation has occurred. Your computer no longer needs to be left on or attended all the time.

THE MOST FULLY-FEATURED DEVICE OF ITS KIND

TURN-ON has all the finest available telecommunications features and much more. It is available as a turn-key hardware/software system that goes far beyond power strips and other remote access devices. TURN-ON gives you automatic log-on 3 phase security:
■ User ID ■ Password protection
■ Optional dial-back confirmation.
TURN-ON's file transfer program also provides transfer protection by file name.

The Dyna-Talk software permits automatic recording of every incoming modem connection by user ID, tells you which program the user executed, and the time and date of the call. TURN-ON's software is very user-friendly, menu-controlled, easy to use, and PC DOS 2.0 and above compatible. AC line filtering gives complete power surge protection for all devices plugged into the six power outlets. No separate power strip is needed.

TURN-ON PUTS YOU IN CONTROL

Remote distributed micros are now available to you 24 hours a day for such tasks as electronic mail, transferring programs and data files, or the running of other application software. An optional 25 pin connector allows the computer to stay on past phone hangup or manual power-off, so any required processing can be completed.

With TURN-ON, you'll save time and money because you now control and manage the exchange of information with your computer in the fastest, most efficient way possible.

Call today for more information on how easy it is to Turn-On your computer system.

IDEA IS SHIPPING A 5250 TWINAX EMULATOR WITH A UNIQUE FEATURE.

IT WORKS.

Last Fall, two major companies announced a twinax board for PC-to-IBM System 34/36/38 communications. Today, only one company is shipping a product that's fully functional: IDEA.

Unlike our competition, the IDEAcomm 5251 twinax board comes complete with software. This may explain why the thousands of units shipped since December are making IDEAcomm 5251 the industry standard worldwide.

You'll also find many third-party software packages for the System 3X supporting our board: Decisionlink™ and Intelink,™ for example.

But our customers have found lots of other reasons to choose IDEAcomm 5251.

We provide a "hot key" capability, hard disk access, printer support, four concurrent host sessions, and data transfer. Plus, our customers who benchmark IDEAcomm 5251 tell us that it's incredibly fast.

And IDEAcomm 5251 does all this and still requires only 30K of memory on your PC.

So if you want a 5250 twinax emulator with performance rather than a promise, call IDEA at **800-257-5027.**

Computer Automation plans sale of division

IRVINE, Calif. — Computer Automation, Inc. recently announced it has agreed in principle to sell its Commercial Systems division to W. Norris Agee, a Santa Ana, Calif., businessman who is also chairman of Trendata Corp.

The agreement, which includes the sale of Computer Automation's UK subsidiary, is reportedly contingent upon execution of a definitive agreement. and approval by Computer Automation's board of directors and major lender.

The division manufactures Computer Automation's line of Syfa distributed data processing systems and employs 125 people in the U.S.

Computer Automation, which has posted losses in the past two years, was unable to devote adequate resources to the division, according to George Pratt, chairman and chief executive officer.

Financial terms of the agreement were not revealed, but Pratt said it would not result in a loss to the company.

Completion of the transaction is expected by Sept. 30.

Memorex bails out of two joint disk-drive ventures

SANTA CLARA, Calif. — Memorex Corp. recently announced the end of its participation in two four-year-old disk drive component joint ventures with Control Data Corp.

The companies said they will dissolve the operations of Disk Media, Inc. (DMI), a rigid-disk manufacturer in Westlake, Calif. DMI employs about 200 people.

In the same announcement, Memorex said it agreed to sell its share in Peripheral Components, Inc. (PCI) to Magnetic Peripherals, Inc. (MPI), CDC's loss-plagued thin-film recording head subsidiary. Minneapolis-based PCI, which also makes thin-film heads, will operate as a wholly owned subsidiary of MPI. Memorex said it will continue to buy thin-film heads for its IBM-compatible disk drives from PCI.

Memorex, a subsidiary of Burroughs Corp., will replace its supply of rigid disks from DMI by expanding its 3680 disk manufacturing operation here.

CDC said it will supply its rigid-disk requirements from a CDC facility in Omaha.

TRW unit to establish Calif. center

PARSIPPANY, N.J. — The Ultimate Computer Services, Inc. (UCS) operation of TRW, Inc.'s Customer Service Division recently announced that it will open a Baldwin Park, Calif., center for the reconditioning and refurbishing of computer equipment.

UCS, which operates similar centers in Rockaway, N.J., and Bensenville, Ill., said the West Coast equipment reconditioning operation will open Sept. 3.

The center will reportedly include staging and testing of water-chilled systems, a raised-floor area to simulate conditions in a data center environment and computerized work flow and inventory control.

Services provided by the company include relocation, features modification, sales, warehousing and refurbishing.

MERGERS AND ACQUISITIONS

United Technical Products, Inc. (UTP) of Canton, Mass., announced that the company has been acquired by a unit of **HMK Industries, Inc.** HMK is a manufacturing and distribution company headquartered in the Boston area. UTP will operate as an autonomous subsidiary of HMK.

■

Continental Telecom, Inc. (Contel) and **IPC Communications, Inc. (IPC)**, Atlanta, announced an agreement in principle under which Contel would acquire IPC in an exchange of stock valued at approximately $55 million.

It was reported that, under the agreement, Contel would issue an aggregate of 2.3 million shares of its common stock in exchange for all of the issued and outstanding shares of IPC.

The agreement would result in an exchange ratio of approximately one-half of a share of Contel common stock for each share of IPC stock.

■

Advance Circuits, Inc., Hopkins, Minn., and **Multaplex Corp.** announced they have executed an agreement whereby Advance Circuits will acquire the multilayer printed-circuit manufacturing operations of Multaplex for approximately $10.5 million in cash.

The transaction, which has an effective date of Sept. 3, is subject to the approval of Multaplex shareholders.

■

Hewlett-Packard Co., Palo Alto, Calif., has agreed in principle to acquire an equity interest of approximately 15% in Taiwan-based **Microelectronics Technology, Inc. (MTI)**

Final agreement is subject to approval by shareholders of MTI, the HP board of directors and the government of Taiwan.

■

Bishop Graphics, Inc. announced that **Perfectdata Corp.** has agreed in principal to be acquired by Bishop.

Under the terms of the proposed agreement, Bishop will acquire 100% of Perfectdata's stock in exchange for an undisclosed amount of Bishop shares.

The acquisition is subject to the approval of the board of directors and shareholders of both companies. The target date for completion of the acquisition is Sept. 1.

■

Sytek, Inc., Mountain View, Calif., announced that **General Instrument Corp.** has increased its interest in Sytek by exercising an option to acquire additional shares.

The option is for an equivalent 1.4 million shares of Sytek common stock, increasing General Instrument's ownership to 6.4 million shares, or 57% from 51%, prior to exercise of the option.

■

Control Data Corp., Minneapolis, announced the acquisition of **Computer Maintenance, Inc.**, a third-party computer maintenance vendor based in Denver.

Terms of the agreement were not disclosed.

■

The acquisition of Buffalo, New York-based **Software Distribution Services** by **Ingram Software, Inc.**, of Nashville has been completed. The combined companies will be known as Ingram Software Distribution Services, Inc. and will be a wholly owned subsidiary of the Ingram Distribution Group.

POPLOG.

Where Artificial Intelligence Solves Real-World Problems.

Now you can dramatically reduce costs and create expert or knowledge-engineered systems more quickly and easily with POPLOG.

An integrated combination of languages, POPLOG is a fully-supported interactive AI development environment that runs on VAX(VMS), VAX-(UNIX), SUN II workstations and HP 9000/200 computers. Because it allows the most appropriate language to be used in a given situation (PROLOG, LISP AND POP-11), it provides incremental compilation facilities to promote fast prototyping. Routines can be written in PASCAL, C, FORTRAN, and ADA all of which can be linked into the POPLOG environment.

POPLOG contains an on-line support system and a powerful screen editor to provide a set of AI-based tools. Once you see how much power you can obtain for a fraction of the cost of other more complicated, hard-to-use systems, you'll want POPLOG.

For more details and our exclusive NO-RISK evaluation, call or write today. POPLOG is the artificial intelligence tool that solves real-world problems.

Tandon posts quarterly loss

CHATSWORTH, Calif. — Tandon Corp. recently reported a loss of $14.9 million, or 29 cents per share, for the third quarter ended June 28. The results brought Tandon's losses for the first nine months of fiscal 1985 to $50.2 million.

Third-quarter revenue fell to $62.3 million, compared with $106.2 million in the year-earlier quarter. Tandon earned $10.4 million, or 21 cents per share, in the third quarter of 1984.

Tandon's pretax loss in the third quarter was posted at $21.3 million. A spokesman attributed the loss to inventory write-downs for older product lines and start-up costs associated with the development of products.

A spokesman cited "significant start-up and maturation costs" during the quarter from the development and production of 3½-in. Winchester hard disk drives, 5¼-in. high capacity Winchester drives and IBM-compatible computer systems.

SPECIAL REPORT

Minis and Small Business Systems

September 30

The September 30th Special Report will take a close look at the minicomputer and small business systems market. We'll discuss the latest trends in minicomputer architectures and examine the evolving supermini market. And we'll cover what's happening in the supermicro market and how it's affecting the mini market. We'll include reports from users on the problems that they encounter in selecting and implementing minicomputer systems and the solutions they discovered.

Computerworld's user subscribers are heavily involved in the purchase of computer systems —82% make purchase decisions for minicomputers and 84% are involved with the purchasing of small business systems for their organizations.

If you want to reach Computerworld's audience of 687,000 computer-involved professionals with information about your superminis, minis, supermicros or small business systems and any related products or services, this is the place to be. Computerworld's Special Report on Minis and Small Business Systems.

Reserve your space for the September 30th issue today. Simply fill out the coupon below and drop it in the mail. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales office. But hurry, the closing is September 13th.

Advertising close: September 13

☐ Yes, I want to reach buyers of minicomputers, small business systems and related products or services. Reserve space for my ad in the September 30th Special Report issue.
☐ I'd like information about Computerworld's upcoming Special Reports. Please send me your rate card.
☐ Please have a sales representative call me.

The office of the future arrives in October by mail.

Few things are changing as fast as the office work place. What with things like word processing and electronic mail and telecommunications, it's tough keeping up with what's available today. Let alone what's coming tomorrow.

But that's exactly what we're going to do in our October 16th Office Automation issue of *Computerworld Focus*. And that gives you an ideal forum to sell just about any computer-related office product you have. Because you can surround your advertising with hot, relevant editorial.

We'll start by taking a look at the needs of the end user. And how today's technologies and MIS/DP departments are—or aren't—handling the problems.

Then we'll discuss today's trends and where they seem to be taking us. Trends like top-to-bottom computer architectures. Standardized communications protocols and operating systems. Integrated software. Fiber optics. Cellular radios and phones. Just about every new twist for the office of the future.

So if you've got a product or service that belongs in the automated office, it also belongs here. The **October 16th** issue of *Computerworld Focus*. But hurry, closing is **September 6th** (materials due one week later).

For more information, contact Ed Marecki, Vice President/Sales, *Computerworld Focus*, 375 Cochituate Rd., Framingham, MA 01701 at (617) 879-0700. Or call your local sales office.

TREND

from page 81

For the rest of the computer industry, the continued depressed state of U.S. sales and dips in foreign sales could generate some very poor financial results for the current reporting period. If that turns out to be the case, the past few months of isolated layoffs and shutdowns could very quickly turn into a general trend in coming weeks as vendors move to balance costs against gross incomes.

■

After recently posting its first quarterly loss in two years [CW, Aug. 5], Applied Data Research, Inc. nonetheless expressed confidence that a traditionally strong second half would produce year-end profits of $2.10 per share. On Aug. 8, however, the company said it expects profits in the range of $1.50 per share for the year. The company said a continued slowdown in buying decisions in July leaves it less confident that it can make up the first-half shortfall.

■

The leading lights in the microcomputer software arena appear to be staying afloat quite nicely. Privately held Microsoft Corp. recently announced that it had sales of $140 million for the year just ended.

Microsoft founder Bill Gates said, "Our long history of success indicates a strong, viable, growing company in an industry that has seen its share of flash-in-the-pan ventures."

While the microcomputer software segment of the industry seems poised for a dramatic cycle of compression over the next year, it remains to be seen how long Microsoft can hold off from adopting the aggressive acquisition strategies adopted by the other companies in its league: Lotus Development Corp. and Ashton-Tate.

■

The Computer and Business Equipment Manufacturers Association (Cbema) recently offered a half-hearted apology for its March 6 comments criticizing Sentinel Bio-Tech Products' plan to market a screen to shield computer users from low-frequency emissions of VDTs.

According to a recent statement, "The Cbema March 6 press release was intended to reaffirm Cbema's longstanding position that there are no harmful emissions coming from VDTs. Cbema remains of that view, but withdraws its March 6 statements to the effect that Sentinel was acting in an unethical manner in announcing its marketing efforts."

Porter chosen to head Triad

SUNNYVALE, Calif. — Triad Systems Corp. has selected Informatics General Corp. executive James M. Porter to serve as president and chief executive officer.

The announcement was made by William W. Stevens, Triad's current chairman, president and CEO. Porter was executive vice-president of Informatics, which is currently in the process of being acquired by Sterling Software, Inc.

According to Stevens, who will remain as chairman at Triad, Porter will assume his duties Sept. 1. He said that Porter's skills will strengthen the company's top management.

FASB

from page 81

accounting as costs are incurred. The Association of Data Processing Service Organizations, Inc., representing software and services vendors, argued in favor of greater capitalization.

In the past, reporting procedures of companies had varied between straight expensing and capitalization.

In April 1983, the SEC essentially placed a moratorium on the situation by prohibiting companies from switching from the expensing method to the accounting method.

According to securities analysts, the revised standard will boost quarterly earnings of some software companies by as much as 10% to 15%. But the hikes only reflect paper profits, enabling companies involved in development to record as assets some of the costs they previously had to charge off against profits.

DMS appoints two top execs

LEXINGTON, Mass. — Two top-level McCormack & Dodge Corp. executives recently resigned to take the top jobs at Distribution Management Systems, Inc. (DMS), an applications software firm here.

John B. Landry III, who was executive vice-president of research and development at M&D, has been named chairman of the board of DMS, which develops and markets distribution packages, including order entry, inventory management and automated warehouse systems. Robert K. Weiler, M&D's former senior vice-president of marketing, has been appointed to serve as president of DMS.

Formed in 1976, DMS is a privately held company with $6 million to $7 million in annual revenue and approximately 100 employees, according to James L. Fox, the firm's vice-president of finance and administration. Fox said the pair has acquired equity interest in DMS.

A spokesman for M&D said the parting was on good terms, and the two will not be immediately replaced. Robert Kelley, M&D's vice-president of product directions and strategy, will take over some of Landry's responsibilities.

Beehive reorganization OK'd

SALT LAKE CITY — Beehive International, Inc., a maker of IBM- and Digital Equipment Corp.-compatible terminals based here, recently had its reorganization plan approved by a federal court. The decision means the company has exited the reorganization proceedings it entered in October 1984, under protection of Chapter 11 of the Federal Bankruptcy Act.

Beehive agreed to a debt-to-equity conversion that grants 45% of its common stock to its lead creditor, the Federal Deposit Insurance Corp.

Beehive President Joseph F. Carbone Jr. said the firm absorbed a $9 million write-down for closing its Fermoy, Ireland, manufacturing plant. According to Carbone, Beehive's reorganization plan cut the firm's expenses by an estimated $6 million by reducing its work force 50% and trimming discretionary expenses.

Beehive, which posted approximately $30 million in sales in 1984, recorded losses in the last three quarters of the year.

TEST

from page 81

ates (called chaebols in Korean), Samsung assembles an American computer, the Hewlett-Packard Co. 3000, in Korea. The U.S. Department of Commerce listed seven U.S. vendors that used Korean manufacturers as of January 1985, including Digital Equipment Corp. (Doosan Computer Ltd.) and Honeywell, Inc. (the Lucky-Goldstar Group).

One of the most recent such OEM assemblies is Leading Edge Products, Inc.'s low-priced Model D, an IBM Personal Computer-compatible micro made by Korea's Daewoo Group. "[The computer industry] has seen a lot of these [U.S.-Korean agreements] already, and we think it gives us the best product at the best price," said Michael Shane, chairman of Canton, Mass.-based Leading Edge.

Samsung will sell its two exported systems exclusively to OEMs, dealers and distributors in the U.S. through its distribution arm, the B. J. Davis Corp. of Akron, Ohio. The goal, Koo said, is for Samsung to break the American ice for higher ticket products still in the development stage back in Korea. "We're working on a 68000-based Unix workstation and a 32-bit Unix machine," Koo said. "We think our next systems will be able to compete very well."

According to Janow, Samsung and other Korean vendors will soon be in the U.S. to stay. "They have some problems in research and design, but I think they'll overcome those," she said. "The global competitors will come from Japan and Korea; I really can't see any other entrants. Five years down the road, they'll be right in there."

SST, founded in 1977 as a wholly owned government corporation called Korea Telecommunications Co., was denationalized in 1980 and taken over by the Samsung Group. Samsung, Korea's largest chaebol, has 26 subsidiary companies doing business in fields as diverse as shipbuilding, petrochemicals, sugar, insurance, hospital equipment, hotels and newspaper publishing.

Samsung's ties to the Korean government remain strong, with joint ventures such as codevelopment of the SSM-16 and the future 32-bit product. But unlike their well-known Asian counterparts in Japan, Samsung and other Korean companies do not receive direct government subsidies.

"The government would like to support us, but it spends a lot of money for defense, and the funds are not there," said Nahm-Wook Lee, executive managing director of SST's computer business group. "We pay a lot of taxes, too."

Lee believes Samsung's strength lies in mass-produced items that can best take advantage of Korea's low-cost labor and components. He acknowledged that Samsung's experimental tryout in the U.S. micro market poses a very different kind of challenge. "It will be very difficult to sell [computer] systems outside of Korea. The No. 1 problem is software support, because there is no one standard product," Lee said.

UNIX SYSTEM V. SOFTWARE THAT STACKS UP.

High-quality application software written for UNIX System V is available now. And new business programs are continually being developed.

That means increased market opportunities for VARs and ISVs. And end users can be certain their investment in a UNIX System V-based computing system is a smart, sound one.

Quantity and quality

The market for products that are based on UNIX System V has grown significantly over the last two years. There are now hundreds of packages written for UNIX System V. And this growth will continue.

Quality applications—general business packages and development tools—are now available for the AT&T UNIX PC. And AT&T is putting together even more hardworking, industry-specific software to run on AT&T 3B2 and 3B5 Computers.

With so many packages available, VARs can offer more turn key systems based on UNIX System V to an ever-growing customer base. ISVs can sell software to even more customers. And end users can invest in a UNIX System confident there is plenty of quality software available.

Software you can bank on

UNIX System V has gained acceptance as a powerful, versatile computing standard. More hardware vendors like NCR, Altos, Motorola, Perkin-Elmer and Sperry are joining AT&T in offering products based on UNIX System V.

And we've introduced the System V Interface Definition. Software written under the Interface Definition can run on current and future releases of AT&T's UNIX System V, as well as various System V derivatives offered by AT&T licensees. So there will be an even larger, more comprehensive base of portable software from which to choose.

Our comprehensive UNIX System V Software Catalog lists a full range of packages that run under UNIX System V. For end users it's a reference guide to the programs available. And for developers it's a smart way to ensure packages will have even greater exposure to the growing UNIX System V market.

To learn more about UNIX System V market opportunities, order the UNIX System V Software Catalog—at $19.95 plus tax. Call 1-800-432-6600 and ask for Operator 391.

UNIX System V. From AT&T. Consider it standard.

AT&T
The right choice.

VM/SP Systems Programmer/ Systems Manager

A new position for a Systems Manager experienced in VM exists within LOTS, a division of Academic Computing and Information Systems. This person will report to the Director of the LOTS Computer Facility and lead our activities on the IBM/4381. Must work effectively with our academic users to establish operating procedures appropriate to their needs and function to keep the system running smoothly. Will supervise one professional programmer and assorted students in their activities in response to users' requirements. Perform or coordinate user training in VM/CMS.

Four year applicable degree or equivalent experience. Thorough knowledge of IBM 370 architecture and assembly language gained through actual work experience mandatory. Experience with working in and supporting an academic community is highly desirable: must enjoy the challenge of working with student and faculty clients and with student helpers. Knowledge of CP and VM/CMS internals. Experience in leading a major project and supervisory experience required.

You will be able to take advantage of the exceptional cultural and recreational facilities available on the Stanford campus. University employees enjoy an excellent benefits package and a vested, tax deferred retirement program. Liberal vacation allowances begin at 3 weeks per year, increasing to 4 weeks after one year of employment.

Send resume and a cover letter highlighting your qualifications to Kathy DeMoulin, Ref. #47257-CW, Stanford University Personnel Department, Old Pavilion, Stanford, CA 94305.

Stanford University has a strong commitment to the principle of diversity. In that spirit, we are particularly interested in receiving applications from a broad spectrum of individuals including women, members of ethnic minorities and disabled individuals.

STANFORD UNIVERSITY

COMPUTER CAPACITY ANALYST

Reno, Nevada

Tired of the commutes, crowds and smog? Consider the dynamic, exciting little city of Reno, Nevada, located at the base of the high Sierras. Reno means water skiing, snow skiing, Lake Tahoe and world famous stars in glittering 24 hour exciting downtown casinos.

Our environment features an IBM 3083 and two 3031s under operating systems MVS/CMS. This position is responsible for performing complex statistical analysis including trend analysis and application of multivariate techniques.

The ideal candidate must have experience in systems programming including software installation and maintenance, system tuning and understanding of operating systems and components. The successful candidate for this position must have considerable knowledge of mathematics, statistics and computer science. Excellent communications skills are essential in this position as the individual will interface with a wide range of areas.

In addition to moving expenses and present mortgage payment assistance, we're offering a top salary and benefit package. Please submit resume to:

APL PROGRAMMER/ ANALYSTS

KARSTEN MFG. CORPORATION, a nationally known sports equipment manufacturer, is seeking APL Programmer/Analysts. Immediate positions available:

- Business Systems Applications
- Engineering & Parts Manufacture Applications

Familiarity with APL language required. Qualified candidates submit salary history and resume to Personnel Dept., at P.O. Box 9990, Phoenix, AZ 85068.

Director, Technical Services

Join our new management team

The Franklin Mint is a $300 million consumer products marketing company with 3000 employees worldwide. Our new, aggressive entrepreneurial management views information systems and communications as key elements in the future success of our company.

Working with our new VP of Information Systems, you will have an extraordinary opportunity to impact our company's growth by providing technical direction to our systems development and operations staff. You will also lead capacity planning, performance measurement, disaster/recovery planning and security projects. Our environment includes multiple IBM 30XX-Series mainframes which operate under MVS with IMS, CICS, TSO, COBOL, UFO, Easytrieve and RAMIS.

The person we seek for this high visibility position should have at least 5 years progressively responsible experience supporting large-scale IBM-based computing centers. Excellent communication skills and a Bachelor's degree are mandatory. A Master's degree is a definite plus.

If you seek a challenging opportunity that provides an excellent compensation package (including paid relocation), and recognition for top performance, send your resume, indicating salary history to: Executive Recruiter, JPC 819, The Franklin Mint, Franklin Center, PA. 19091. Equal opportunity employer m/f.

Principal Programmer

The University of California, Los Angeles, has an immediate opening for a Principal Programmer in its Laboratory of Nuclear Medicine. Primary duties include total responsibility in the research area of positron emission tomography for system programming, system management, application programming, supervision, consultation and training. Position requires: education and experience equivalent to a Bachelor of Science degree in Computer Science, Electrical Engineering or equivalent and six years of experience in computer programming including two years of experience which relates directly to positron emission tomography using state-of-the-art scanners and high level scientific programming languages. Also required is a detailed knowledge of: Assembly Language, FORTRAN, RATFOR and C; architecture of PDP systems; and operating systems structure of RSX 11M. Demonstrated skill in working with positron emission tomography and EG&G Ortec and CTI positron tomographs; demonstrated supervisory, system management, consultation and training skills. Salary range is $2808 to $4373 per month. Please send resumes to: University of California, Los Angeles, Laboratory of Biomedical & Environmental Sciences, Laboratory Personnel Officer — MR Job 09-3572, 900 Veteran Avenue, Los Angeles, CA 90024. An Affirmative Action Employer.

DATA BASE ANALYST

Major Twin Cities area firm seeks analyst to do logical/physical design and data base modifications. Requires IDMS or IMS experience. Salary to 40K. Call Mark David or Tim Smith at (612) 339-9001.

ROBERT HALF
OF MINNESOTA, INC.
3535 IDS Center
Minneapolis, MN 55402

Pioneering in any field demands inquiring technical minds — people capable of applying present technology to the future. Of looking forward. Pushing limits. Creating ways to apply new hardware and software. Central to our success is our ability to integrate new developments in the rapidly evolving science of communications. The following positions represent an opportunity to play a key role in the development of our services — ways you can become one of the bold pioneers creating new boundaries of networking technology.

TELECOMMUNICATIONS SPECIALISTS

Openings are available for this position throughout the United States to install and maintain sophisticated telecommunications equipment. You must have an AS degree or equivalent in Computer Technology or Electronics, a knowledge of earth stations and switching nodes (Tandem and/or Rockwell/Collins equipment preferred), and familiarity with communications protocols such as X.25 and HDLC. Practical knowledge of voice grade and DDS data circuits is also required.

SR. TELECOMMUNICATIONS ENGINEER

You will design programmable communications interfaces for various protocols (i.e. X.25, mobile satellite, SDLC/SNA, etc.). A Bachelor's degree or equivalent in Electrical Engineering or Computer Science and four years professional experience in communications or computer systems engineering and testing are required. You must have a thorough knowledge of microcomputer hardware and software and good communication skills. Experience in computer hardware, programming or data transmission is preferred.

SR. TECHNICAL ANALYST/NETWORK OPERATIONS

You will provide maintenance and diagnostic technical support to isolate and resolve component and system problems; formulate and document operational procedures. You must have a Bachelor's degree or equivalent in Computer Science or Electrical Engineering. Five years professional experience in field maintenance/repair/technical support of high technology computer, microprocessor, office products and/or telecommunications systems is required along with strong interpersonal skills.

CHIEF ENGINEER/NETWORK DEVELOPMENT

You will provide unique technical expertise in performing design and development of advanced telecommunications systems; develop telecommunications strategies to support corporate objectives; and ensure cost effective network systems. A Bachelor's degree or equivalent in Engineering, Computer Science or related field is required; Master's degree is preferred. You must have eight years professional data communications or computer systems experience, including five years experience in data communications planning, development or engineering. Knowledge of communications transport protocols and interfaces is required along with the demonstrated ability to work with broadly defined goals.

PROJECT ENGINEER/NETWORK DEVELOPMENT

You will design and develop advanced telecommunications systems and develop telecommunications strategies to support corporate objectives and to ensure cost-effective network systems. A Bachelor's degree in Engineering, Computer Science or a related field is required; Master's degree is preferred. You must have six years professional experience in data communications or computer systems, including three years in data communications planning, development or engineering. Knowledge of communications transport protocols and interfaces is required along with the demonstrated ability to work with broadly defined goals.

SR. ENGINEER/SATELLITE SYSTEMS DEVELOPMENT

You will participate in the design and development of spacecraft, earth stations and network control for the satellite communications network and provide the technical coordination with manufacturing contractors. You must have a BS in Engineering, MS preferred, and four years experience in the design and development of a space-based communications system which includes direct program experience from design to operation. Experience in aerospace industry manufacturing and contracting required.

SR. ENGINEER/SOFTWARE

You will plan, design, code, test and implement software and firmware for use in electronic mail applications. A Bachelor's degree or equivalent in Electrical Engineering, Computer Science, Math or Physics is required along with five years systems programming experience with microcomputers or microprocessors. A Master's degree is preferred. You must be proficient in real-time assembly language programming as well as high level (BASIC, PL-1, FORTRAN, PASCAL) language programming.

PROGRAMMER ANALYSTS

Requirements include experience using online systems, OS/MVS, IMS, large-scale IBM systems, and strong analysis and design skills. A minimum of three years experience using COBOL is also required.

Ours is a unique and creative environment for achievement. Technical resources are superior. Salaries are competitive. And our corporate benefit program is comprehensive. If you are eager to create new boundaries of networking technology, please call Toll Free, 1-800-[illegible]-2222, between 8:30 AM and 12:30 PM (CDT), Wednesday or Thursday, August 21 or 22, ONLY, or forward a letter or resume indicating your experience and salary history, in confidence, to the address below.

TO EXPEDITE CONSIDERATION, PLEASE INDICATE THE POSITION FOR WHICH YOU ARE APPLYING ON YOUR REPLY ENVELOPE.

ALASKA ALASKA ALASKA

DATA BASE SPECIALIST

If a 5,000-mile communications network linking 13 major sites with 6 computer systems sounds challenging, the University of Alaska Computer Network would like to hear from you. We have an opening for a Data Base Specialist to work under the general direction of the Data Base Administrator on an IBM 4381-2 running MVS/OS, ISPF, and PanValet. Our data base is Cullinet's IDMS/R release 10.0 and support software consisting of ADS On-Line, Automatic System Facility, On-Line Query, and Culprit.

MINIMUM QUALIFICATIONS:

Candidates for the Data Base Specialist position must have a demonstrated proficiency with IBM 4381 or equivalent mainframe running OS; OS JCL; IBM system utilities; performing in a data base environment and on-line applications.

Under the general direction of the Data Base Administrator, this individual performs the full range of data base requirements in support of user activities. These requirements include the data base management systems design, definition, organization, security, efficiency, documentation, generation, software installation, long-term requirements and operational guidelines. Minimum annual salary is $42,016.00.

Send letter of application, resume and three references to:

Statewide Office of Human Resource Development
University of Alaska
Room 1, Bunnell Building
Fairbanks, Alaska 99775

Closing date: August 24, 1985

The University is an AA/EEO employer and educational institution.

MANAGER
ADMINISTRATIVE PROGRAMMING

Excellent opportunity in growth environment. Responsible for systems & programming activities in the administrative support area where staff includes the director, professional programmers, and student assistants. Facilities include a VAX-11/750, two PDP-11 systems, 60 personal computers, and 110 terminals.

Bachelor's degree required. Prefer computer science or related discipline, and experience with administrative programming in an educational environment. Experience with RSTS/E and/or VMS is highly desirable. Good communications and interpersonal skills and the ability to direct the work of others is essential. Teaching in computer studies may be possible. Salary commensurate with qualifications.

Located in the cultural, financial and governmental center of the state, the College has a recognized standard of excellence, is financially sound, and has an enrollment of 1300, an all-time high. With a strong liberal arts and science program, strong pre-professional programs, and a School of Management, the College is a co-educational institution affiliated with the United Methodist Church.

Position available now. To be assured of consideration, send resume and names of three current references by September 2, 1985 to:

Fred L. Deckard, Jr.
Director of Computer Services
Millsaps College
Jackson, MS 39210

Millsaps College

An equal opportunity employer.

SAUDI ARABIA
DP CAREER OPPORTUNITIES

The Computer Department at the Ministry of Planning is seeking highly motivated individuals to play a major role in the definition, design, programming and implementation of business, planning and socio-economic systems.

The Ministry of Planning of the Kingdom of Saudi Arabia is responsible for the preparation of the national 5-year development plans and the monitoring of their implementations.

The mandate of the Computer Department in the Ministry of Planning is to provide computer support to its different departments by developing necessary models and systems, and maintaining existing ones.

These systems are being developed on an IBM 4341 VSAM/TSO/ISPF using mainly ADABAS/NATURAL but also COBOL, FORTRAN and SAS.

A number of immediate opportunities are available for DP professionals in the following areas:

OFFICE AUTOMATION MANAGER

MS required in Computer Engineering or Computer Science or equivalent. At least 8 years experience in Data Processing out of which at least 4 years must be in managing and implementing office automation technology. Must have the experience of using the microcomputer software (DBASE II, WP, Spread-sheet etc.). Ideal candidate will also be familiar with the Arabic language business systems and development software. Interpersonal skills and ability to train users.

SYSTEMS ANALYSTS

BS/BA required as a minimum. Must have at least six years experience in DP and a proven track in the following areas: Requirement analysis, project responsibilities from inception through completion, excellent written and verbal communication skills, familiarity with conventional languages, hands-on experience in ISPF, knowledge of data base concepts, experience in using systems development methodologies and in preparing documentation for all phases of the systems development life cycle, experience in statistical modelling is a plus.

PROGRAMMER/ANALYSTS

BS/BA required in CS or related discipline, must have at least four years experience analyzing, designing, programming, testing and maintaining business application systems on IBM mainframe, good knowledge of COBOL and/or PL/1 essential, familiarity with FORTRAN and NATURAL is a plus, good communication skills. Familiar with systems development methodologies and documentation of application systems.

COMPUTER PROGRAMMERS

BS/BA or equivalent diploma required. Must have at least three years experience in preparing program design and specifications, programming and testing business application systems on IBM mainframe, experience in using different access methods including VSAM and data base management systems, good communication skills.

TRAINING INSTRUCTOR

BS/BA required in CS or related discipline. Must have at least five years experience in DP two of which in computer teaching and preparing training materials, excellent written and verbal communications skills.

For all positions, bilingual applicants (Arabic, English) are preferred. All positions are offered on a 2-year contract basis. Excellent benefits package includes free medical care, housing and furniture allowances, education allowances for children, transportation and maintenance allowance, 45-day annual leave and a yearly round-trip ticket to the location of the present residency.

Applicants should immediately send resume including telephone numbers, references, recent passport-size picture, salary history and desired position to:

Computer Department, Ministry of Planning
P.O. Box 358
Riyadh 11411, Kingdom of Saudi Arabia

Telephone: (966) 01-401-[illegible]
Telex: 20[illegible] PLAN SJ

Last date for submission of applications is September 4, 1985.

GERMANY

We are the leading software house in the field of OSI network software, UNIX-based system developments and artificial intelligence. As a subsidiary of the largest European service group (GSI) and the Deutsche Bundespost our company shows an outstanding growth history. Large vendors, the Deutsche Bundespost and major endusers are our client basis for future company growth. In our branch offices in MUNICH, STUTTGART and DARMSTADT we have openings in new and innovative telecommunication software projects for

Software Professionals

with a record of accomplishments in the areas UNIX-based systems software developments, communications protocols (eg OSI, DECNET, ICP/IP, SNA) and MVS System internals.

Qualified candidates must have several years experience in system software development: Design and implementation. Basic knowledge of the German language and experience in handling complex system developments are plusses.

6 weeks vacation, an attractive salary and a range of large company benefits including assistance with relocation expenses are offered.

US Representative OSI Software Products

More than 100 manyears development efforts lead to our UNIX-based OSI communication products and test systems. After having achieved a leading position in Europe with our UNITEL products we are now preparing to enter the US market. To start our US operation we have a challenging opening with high growth potential for

Manager — Sales & Marketing

The successful candidate should have several years experience in telecommunication software development such as TCP/IP or LAN protocols, SNA or DECNET components and complex system software preferrably UNIX-based. The candidate should have a successful track record in a sales position with either telecommunications products or software packages.

In order to introduce the successful candidate to DANET's products and business strategy a comprehensive training program will take place in Germany. Attractive salary, profit sharing and an incentive plan will be negotiated.

Interviews will be held in the US during September 23 to 27. Please call 00149-6151-86030 or send resumes, salary requirements and references to

What do MIS application Pros have to do with developing tranquilizers?

Have you often wished you could use your talents in some special endeavor, and win recognition and advancement while doing it? Here, is that opportunity.

Wyeth is a leading international pharmaceutical company with an expanding need for MIS development and applications professionals. At our facilities located in Great Valley, PA, one of the nation's newest high-tech corridors, you'll be creating and strengthening MIS to aid operations, procedures, and management decision-making in creating antibiotics, Infant nutritionals, Analgesics, Biologicals, Cardiovasculars, antihypertensives, and other life-saving, life-enhancing products.

You will work with advanced systems applications, providing support for Wyeth's operations, reporting and planning functions. Your work will impact on research, market analysis, capability assessment, product development, manufacturing, marketing, distribution, personnel. . .and more.

You'll be positioned in a large-scale IBM environment, and will use the latest system releases and software technology—e.g., high-level interactive system development.

Project Managers Operations Research

Responsible for development of computerized compliance validation of systems for drug safety evaluation, MIS, and manufacturing operations. Validation covers compliance with FDA standards. Must have experience in validation of computer systems to government standards. Position #GV5003C

Programmer/Analysts

Develop and code analysis and report programs for MIS functions. Requirements: at least 2 years of applications programming experience (systems analysis experience desirable). Basic knowledge of hardware functions and software methodology, including on-line database programming. Openings for senior and subordinate positions. There are various openings requiring varying amounts of experience (2, 4, etc. years) in applications and systems programming. Position #GV5002C

Explore your exceptional career advantages with Wyeth that include a very competitive salary, extensive company benefits, and a distinctive work environment. Send your resume indicating position of interest to: Manager of Recruitment, Wyeth Laboratories, Inc., P.O. Box 8299, Philadelphia, PA 19101. Equal Opportunity Employer M/F/H/V responses encouraged.

Wyeth Laboratories, Inc.

PROGRAMMER/ ANALYST
System 38

amicon a GRACE company

Amicon, a division of W.R. Grace and Co., currently has an opening in our MIS Department for an experienced IBM System 38 Programmer. The job experience and functions are as follows:

- The successful candidate will work on the conversion of a multiple System 34 environment to a System 38 environment.
- Individual will also participate in the development of new accounting and manufacturing systems as well as the conversion of existing in-house developed accounting systems.
- Strong on-line systems design and development skills using native RPG III is a must. Experience with the McCormack and Dodge general ledger system along with COBOL, BASIC, IBM MAPICS and IBM Personal Computers is a definite plus.
- Minimum experience is 2 years on a System 38 with an Associate's Degree in Computer Information Systems. We are searching for a candidate with strong oral and written communications skills as well as the ability to work independently in a challenging environment.

If you meet the above requirements, please apply in person or send your resume to address below.

COMPUTER & SYSTEMS SR. EDP PROFESSIONALS

Exceptional opportunities exist for software/hardware professionals seeking advancement in a dynamic, state-of-the-art environment. Join SDC in RESEARCH TRIANGLE PARK, N.C. by qualifying for the following position:

SR. HARDWARE/SOFTWARE PLANNERS

We are looking for Senior EDP Professionals who will accept the challenge of conceiving, designing, implementing and maintaining a state-of-the-art data center and distributed system architecture. You will be responsible for refining the system architecture, evaluating the new hardware/software technologies and procuring the necessary hardware/software. Our direction includes an IBM 3090-200 with IBM 43XX compatible distributed systems and IBM compatible PC's as workstations. Our software environment is MVS/XA, TSO/SPF, CICS, ADABAS, NATURAL and other Fourth Generation Languages.

You must have 8-10 years experience in performing various aspects of resource planning, configuration design, hardware/software evaluations, procurements and installation of large IBM central and distributed data centers. Ideal candidate will have background in system programming, capacity planning and related technical services functions in a large IBM multi-host environment. Since you will be presenting your plans, designs and recommendations to Senior EDP management, you must possess excellent oral and written communications skills. A B.S. or M.S. is desired.

We offer highly attractive compensation/benefits programs and advancement opportunities. For immediate, confidential consideration, send resume to: Neil Birkhahn, Human Resources Specialist, SYSTEM DEVELOPMENT CORPORATION, P.O. Box 12314, Research Triangle Park, N.C. 27709.

WEST VIRGINIA UNIVERSITY

WVU Computing Services, providing capabilities ranging from microcomputers to worldwide network access for the University's 18,000 students and 5,000 faculty and staff, is expanding its staff and seeking applicants at all levels.

USER CONSULTANTS: Candidates must have excellent communication and problem-solving skills, enjoy helping others, and handle multiple tasks simultaneously. IBM MVS, WYLBUR, CMS, VAX/VMS, or microcomputer or networking experience is desired. Previous consulting with academic computer users is a plus. Minimum qualifications are a BS in Computer Science or related field and 6 months experience. More experience is required for higher level positions. Annual salary ranges are from $16,128 to $27,780.

SYSTEMS ANALYSTS & PROGRAMMERS: Candidates must have excellent communication skills, be familiar with IBM MVS, WYLBUR, or CMS, and have a knowledge of MARK IV, ADABASE, or Natural. Minimum qualifications are an Associate's Degree or equivalent college credits in Computer Science or two years of formal or on the job technical training in Computer Science. Higher level programming positions call for increased experience. More senior level systems analyst positions require a minimum of two year's experience in programming and/or analysis and knowledge of additional languages.

SYSTEMS ANALYST III: This senior level position is now open. Challenges include: long-term administrative system analysis; hardware and system software evaluation; project team leader; product evaluation and recommendation; and, senior level administrative consulting. In addition to the education and training requirements shown above, applicants must have five year's programming and analysis experience, with emphasis on the latter; thorough knowledge of CICS, ADABASE, and IBM 3081 mainframe; microcomputer experience helpful.

West Virginia University, the state's comprehensive land-grant institution, offers professional challenge, quiet lifestyle and a location surrounded by scenic beauty. We also provide competitive salaries, excellent retirement program, health benefits, vacation plan, and outstanding education opportunities. Located in Morgantown, WVU is close to ski resorts, year round recreation areas, national forests, and wilderness reserves. Hunting and fishing areas are numerous. Major metropolitan areas are within easy driving distance via interstate highways.

To obtain an application, please phone (304) 293-3405. Thank you.

West Virginia University is an AA/EEO Employer

CUSTOMER SUPPORT REPRESENTATIVES
Chicago and New Jersey Offices
GROUND FLOOR OPPORTUNITIES IN A YOUNG, FAST-GROWING, AGGRESSIVE COMPANY

XA SYSTEMS is a fast-growing, aggressive company positioned to become a market leader in on-line development center software for IBM mainframe users.

We are seeking motivated professionals with 2-5 years experience in customer support and/or application development for our Chicago (O'Hare) and Northern New Jersey (Saddle Brook) offices. Knowledge of MVS, TSO/ISPF, IMS, and COBOL is required. Excellent communication/presentation skills and a high standard of professionalism are also important.

Your role in Customer Support will involve a variety of activities:

- training customer personnel in the use of the XPERT series of products
- assisting sales personnel in on-site demonstrations/presentations to prospective customers
- providing the first line of support for customer questions and problems

We offer an excellent compensation package including stock options, a complete benefits plan, and a pleasant, dynamic small company environment. For immediate consideration, please send your resume to Richard Armstrong.

PROGRAMMER/ ANALYST

As a major division of a Fortune 500 Company, Gillette-Paper Mate can offer Programming professionals key opportunities to excel in a dynamic and growing MIS environment. We're currently looking for a highly skilled Programmer/Analyst specializing in DEC technology to provide support for our PDP 11-70 operating under RSTS/E and BASIC PLUS. In this position, you'll play a vital part in the maintenance and development of payroll and other manufacturing support systems.

To qualify, you should have a proven track record in payroll, accounting and/or manufacturing systems applications. The ability to interface effectively with a broad-based user community and work with minimal supervision is a must.

At Gillette-Paper Mate, you'll enjoy an excellent salary, comprehensive benefits, and all the challenges you'd expect from working with one of the world's largest writing instrument manufacturers. Please send your resume with salary history to:

[illegible]
1681 26th Street,
Santa Monica, CA 90404

SYSTEMS ENGINEERS/DATA COMMUNICATIONS ENGINEERS PROGRAMMER/ANALYSTS

At EDS, Factory Automation Is Not An Idle Promise

Electronic Data Systems (EDS) and General Motors (GM) have joined forces to develop factory automation projects that are among the most advanced the world has known.

Our total commitment to computer integrated manufacturing has created tremendous ground floor opportunities in PLANT FLOOR SYSTEMS…MATERIALS MANAGEMENT…DATA COMMUNICATIONS…BUSINESS SYSTEMS…INTELLIGENT PLANT FLOOR DEVICES. We're looking for "hands-on" professionals with manufacturing and/or systems engineering backgrounds — individuals interested in expanding their careers in today's leading technologies.

Currently, we have immediate openings at our facilities in attractive SOUTHEASTERN MICHIGAN suburbs for the following individuals:

SYSTEMS ENGINEERS
- 3+ years of experience in systems integration
- Applications experience with plant scheduling, process controls, materials handling, flexible machining systems and plant-floor programmable devices
- Engineering degree is a plus

IBM PROGRAMMER/ANALYSTS
- Mainframe background
- 2+ years of applications programming experience
- COBOL, PL/1 or ALC background
- Knowledge of MVS/JCL and IBM utilities

DATA COMMUNICATIONS ENGINEERS
- 2+ years experience in Local Area Network Communication
- Working knowledge of SNA, MAP, DECNET and programmable device communications such as Data Highway and Modbus
- Ability to architect LANs using computers and programmable devices

DEC PROGRAMMER/ANALYSTS
- VAX 730/780; VMS Background
- PDP/11xx
- RSX Background
- 1+ year of applications programming
- COBOL, PL/1 or FORTRAN background

In addition to the technical challenges, you will find the suburban area of Southeastern Michigan to be a country/contemporary lifestyle that warms the senses — from the vastness of the Great Lakes, with the beauty of Canada as your next door neighbor, to the wildflowers of Cranbrook. You'll have the Bluegrass Festival, the excitement of Tiger Stadium and some of the best fishing anywhere.

EDS has one of the most supportive relocation programs available. We also offer a unique benefits package to complement our competitive salaries, such as employee discount programs, health and fitness program, in-house leisure/travel department, discount stock purchase plan, credit union/savings/loans/free checking and company paid retirement programs, just to name a few.

Let EDS give you the opportunity to revolutionize factory automation. To find out more, please send us your resume today. We are anxious to make you a part of our team of technical successes. Send your resume in confidence to:

Electronic Data Systems Corporation
3883 Telegraph Road
Dept. 09C-[illegible]-114

Data Processing Professionals

Join the Computer Horizons Task Force of Real-Time Systems Professionals in Long Island, New York

As a talented EDP Professional ready to make that major career move to Consultant Status...

THIS IS YOUR BIG CHANCE!!!

Computer Horizons Corp., the dynamically growing, publicly held and nationally respected consulting firm with offices all across the United States, is once again expanding its Task Force of Real-Time Systems Professionals to "spearhead" major projects for clients located in Long Island, New York.

We are interested in:

...Project Managers...Senior Programmer Analysts...Programmer Analysts or...Programmers

With design or implementation experience in any of the following areas:

- PASCAL
- JOVIAL
- M68000
- SOFTWARE TESTERS
- ULTRA 6, UYK 20
- UNIVAC

In addition, we seek Analysts or Project Managers with Radar, configuration management or military standard 483 experience.

These positions are diverse and challenging every step of the way. The rewards are truly significant. Earnings from day one that are in excess of industry standards and a comprehensive benefits program that includes life, health, major medical and dental insurance, unlimited tuition refund plus relocation and travel assistance.

Please respond by calling or sending your resume to:

As a full-service leasing company,
we won't leave the job unfinished.

What some leasing companies think is a job well done is in reality a job not done at all. But they can't help it, they're not full service. We can help it. As a full-service leasing company, we won't lease you then leave you. We'll always be there with maintenance, refurbishing, after-the-transaction service and more. Because that's what full service is designed to do.

At Greyhound Capital Corporation, we've been leasing, servicing, refurbishing, maintaining and providing financing for computers and other equipment for over 20 years. That means you get the best advice, the best service, the best equipment and the best financing we have to offer. It's a total package.

So remember, if your leasing company is leaving the job unfinished, call us.

We know how to finish it.

THE CLOCK IS TICKING...

Do you have time available on a computer? Or are you offering a special service? Then tell people about it with an ad in the Time & Services section of Computerworld's classified pages.

Every week, we'll deliver your sales message to more than 600,000 computer-involved professionals. The very people who are interested in what you have to offer.

And independent research by STAT Resources of Boston discovered that fully 61% of our subscribers plan to purchase outside services this year.

Place your ads today. Simply call toll-free at (800) 343-6474. In Massachusetts, call (617) 879-0700.

SOFTWARE WANTED

Turn Your Efforts Into $$$

Wanted: Software. Successful software company seeking additional products to market. Must run on IBM mainframes or PCM's. Prefer programmer/operations productivity aids. If you have written a program and you need an international company to market it for you, send an abstract of the product to:

Triangle Software Company

J. Zinn, Triangle Software
4340 Stevens Creek Blvd.
Suite 275
San Jose, CA 95129
(408) 554-8121.

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap. (Available upon request: Software Wanted, Real Estate, and others).

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines. Any special artwork should be enclosed with your ad also. Logos must be submitted on white bond paper for best reproduction.

Cost: Our rates are $144.90 per column inch. (Each column is 1 13/16") Minimum size is two column inches (1 13/16" wide by 2" deep) and costs $289.80 per insertion. Extra space is available in half-inch increments and costs $72.45. Box numbers are $15.00 extra per insertion.

Billing: If you're a first-time advertiser, (or if you have not established an account with us.) WE MUST HAVE YOUR PAYMENT IN ADVANCE, or a Purchase Order Number. Any extensions on this policy must be made through our Credit Department.

OUR NEWEST SOFTWARE TOOK
$20 MILLION TO DEVELOP, 5 YEARS TO WRITE
AND WE'RE GIVING IT AWAY.

No, we're not crazy. And no, we're not joking.

We're Management Science America, Inc. The largest independent applications software company in the world. And by Jan. 27, 1986, we plan to give $20 million worth of our newest software to over 2,000 of our customers. Instantly making it the industry standard for fourth generation technology.

If you're particular about what you get for free, here are the particulars.

We call this technology Information Expert.™ Because it allows all your software systems to carry on intelligent conversations. With one another. In English. And thanks to our data dictionary, nothing will ever sound like Greek.

For end users, our system makes it easy to design reports. Our menus guide you through the process with such ease and intelligence, they'll even tell you the proper responses to use for whatever job you need.

Information Expert also provides a fourth generation language that your data processing staff can use for applications development. So you can do in minutes what used to take hours. Or do in hours what used to take days.

It even allows borderless retrieval of information. That way, you can get all the information you need. Not all the information you don't need.

Why are we giving all this away? It's part of our customer support policy. And if that doesn't sound familiar to you, you should obviously become familiar with us. MSA.

Millennium gets a boost

M&D previews accounts receivable at World '85

By John Desmond
CW Staff

BOSTON — Applications developers are offered more power to edit screens, get help and issue commands with McCormack & Dodge Corp.'s enhanced Millennium on-line applications development system announced at the World '85 users conference here last week.

Also, users awaiting M&D's accounts receivable package were placated by the company's preview of AR:Millennium, its first major application developed using Millennium. The product is scheduled for controlled release in October and general release in December at a price of $95,000.

Several of the M&D users inter-

AT&T cuts 24,000 jobs

By Peter Bartolik
CW Staff

MORRISTOWN, N.J. — AT&T, in its largest consolidation since the divestiture of the regional operating companies, last Wednesday announced plans to eliminate 24,000 jobs from its Information Systems group. The company said its computer operations division will not be affected.

AT&T's move to slash the group's total work force by 20% was not unexpected [CW, Aug. 19] and was seen by analysts as part of an overall company strategy to improve profit margins on digital telephone switching equipment. This move, analysts said, would help AT&T blunt competitive pressures and counter a recent flattening of sales.

The cutbacks were announced by Information Systems Chairman and Chief Executive Officer Robert E. Allen in a nationwide telephone address to employee groups. He said the consolidation is only

IBM turns to Microsoft on systems code

By Clinton Wilder
CW Staff

Formalizing a partnership that set the standard for business microcomputers, IBM and Microsoft Corp. last week signed an agreement to develop jointly future operating systems and systems software products. The pact ensures that Microsoft will play a major role in IBM's efforts to integrate the Personal Computer with its varied product lines.

Both companies declined to discuss specific products covered by the agreement, but analysts said they believe the firms will work together on Microsoft's anticipated Version 4 of MS-DOS and other future offerings. The announcement appeared to calm fears that IBM might adopt a proprietary operating system and thereby lock systems and applications software vendors out of its next microcomputer bonanza.

"The agreement puts to rest whatever questions remained about IBM moving away from DOS," said Michele Preston, an IBM analyst at L. F. Rothschild, Unterberg Towbin. "They have said it, but everyone kept [disbelieving] it. Anyone who still feels that way now has his head in the sand. It's very positive for the industry."

Although the deal does not involve the acquisition of Microsoft equity by IBM, it continues the recent pattern of IBM's joint arrangements with leaders in high-tech fields. Among these have been vendors of long-distance services (MCI Communications Corp.), communications switching equipment (Rolm Corp.) and semiconductors (Intel Corp.).

The financial terms and specific length of the agreement were not revealed, but it represents the largest contract ever signed by the Bellevue, Wash.-based company. Micro-

Artificial intelligence: On the road to reality

By Eric Bender
CW Staff

ANALYSIS

LOS ANGELES — Last week's International Joint Conference on Artificial Intelligence, which drew roughly 6,000 attendees here, marked further milestones on AI's path from research and development to the marketplace.

Among these were the heightened presence of major computer industry players, price/performance boosts for dedicated AI workstations, further moves toward standards such as the Common Lisp dialect, an increased emphasis on linking AI software with traditional computing environments and signs of an upcoming deluge of AI-based software for the real world.

The conference sessions, with their traditional emphasis on highly technical advances in the art and science of AI, were well attended. IJCAI's commercial side had a much higher profile than in previous years, with the exhibit floor often too jammed for attendees to walk freely.

Fifty-seven vendors exhibited, all with professional-looking booths — a far cry in numbers and polish from last year's American Association for Artificial Intelligence show in Austin, Texas. However, as is usual for AI shows, many vendors continued development work until the last minute before the doors opened, and there were noticeably more software bugs than is typical in products demonstrated at mainstream computer conferences.

IBM's new offerings of Prolog and expert systems development tools for VM environments drew a great deal of attention, with showgoers noting that they expected Big Blue to fill its traditional role of blessing the technology and expanding the market. But many commented that the IBM products do not push the limits of AI technology and suggested that the introductions represent a holding pattern designed to keep IBM customers from straying, rather than an aggressive thrust into AI.

As one sign that AI-based software is being readied for widespread commercial use, IJCAI saw increased attention focused on the issue of what kinds of workstations will act as AI delivery vehicles.

Currently, companies that buy AI products "are hard pressed to find anything that meets their needs," according to Larry Geisel, president of Carnegie Group, Inc., an AI software firm. Dedicated Lisp machines are expensive and in scarce supply at customer sites, and they typically lack tight integration with mainstream computing environments, Geisel said. As corporations move toward actual deployment of AI-based systems, the lack of suitable delivery workstations is a growing worry, he maintained.

HP's European sales dip 20%

Foreign market slump might spell bad news for U.S. vendors

By Clinton Wilder
CW Staff

PALO ALTO, Calif. — For U.S. minicomputer vendors counting on continued growth in European markets to offset stalled demand at home, last week's quarterly financial results from Hewlett-Packard Co. could represent a troubling black cloud on the international horizon.

HP reported that its overseas sales unexpectedly fell 20% in the quarter ended July 31, with most of the decline coming in Europe. "While we began to see international order growth moderate several months ago, the sharp decline was greater than we anticipated," said John Young, HP's president and chief executive officer, in a prepared statement.

Young's observations echoed remarks made by corporate executives and analysts last fall, after HP's fourth quarter of fiscal 1984 showed a sudden softening of domestic orders [CW, Nov. 26, 1984]. Because HP's quarterly reporting schedule runs two months ahead of those of most companies, its results last year represented early indications of declining U.S. sales for other vendors and of the worst computer industry downturn ever.

"I don't think HP is the only company going through this; I think we'll see it across the board," said James Reynolds, a market analyst with Dataquest, Inc., a market research firm based in San Jose, Calif. "The European market tends to lag behind the U.S. [market], and the slump in the buying patterns of large corporations is just beginning to take hold there."

Dennis Rainey, the Geneva-based finance director for HP's European operations, said foreign buyers are more cautious about new computer technologies, creating a buying pause at an earlier point in the market's maturity cycle.

"Many of our customers have indicated a preference for waiting to see what the new technologies, particularly in networking, will do," Rainey said. "In the U.S., the prevailing cultural attitude is that we can do anything and it will turn out all right. [European buyers] look at things more skeptically, perhaps more hard nosed in a business sense. They're using more scrutiny a little earlier in the cycle."

Rainey declined to speculate on HP's European results as a bellwether for its competitors but said, "Looking at it from the outside, you'd have to say that the same economic and technical issues will affect others as well."

Overall, HP's third-quarter earnings fell 13% from the year-earlier period. The business and scientific computer maker posted profits of $117 million, or 45 cents per share, compared with $134 million, or 52 cents per share, a year ago. Revenue during the quarter slipped 3%, from $1.68 billion last year to $1.48 billion.

The plunge in HP's overseas sales comes at a time when the strong U.S. dollar's extreme pricing pressure on foreign buyers has begun to ease. But the dollar's recent weakening has only added to customer uncertainty, Rainey said. HP is adjusting European prices on a continuing basis with the unpredictable exchange rate situation, he added.

In addition to shrinking margins for U.S. vendors, the previously strong dollar helped European computer makers become increasingly competitive in continental markets outside their native countries. Firms such as West Germany's Nixdorf Computer AG, Italy's Ing C. Olivetti & Co. and Norway's upstart Norsk Data AS are fighting and winning more and more account battles in the lucrative French and British markets. "Local sourcing makes it easier for local vendors to gain market share," said Philip DeMarcillac, an analyst with market research firm International Data Corp.'s IDC Europa in London.

Rainey noted that the 1% to 1.5% growth of the overall European economy this year has been significantly less than the 2.2% to 2.5% rate anticipated. The sluggishness has been most acute in technology-oriented sectors such as the British and French defense industries.

IBM, too, looms as a major factor for U.S. mini vendors in Europe. "The [IBM] System/36 is part of the problem because it blocks the low end," DeMarcillac said. "Buyers believe IBM will come out with a good upgrade path for it, and its sales have boomed over the last 12 months. The $15,000 to $50,000 market is the key area at the moment."

That is where major players like HP, Data General Corp., Digital Equipment Corp. and Wang Laboratories, Inc. have sought to leverage European sales against the slumping demand on this side of the Atlantic. But if the European market follows the pattern foreshadowed by HP's dip in domestic orders last fall, the U.S. minicomputer industry may be in for a whole new round of tough times.

"In the mini field, HP has been an accurate gauge," said Dataquest's Reynolds. "I think we may see a whole different set of expectations now."

In a separate announcement last week, DG said it will shut down four manufacturing facilities this week. Company spokesman Ed Russell said manufacturing operations will be halted this week at Westbrook, Maine; Austin, Texas; Sunnyvale, Calif.; and the Clayton, N.C., assembly and test facilities.

Operations will continue at other facilities, but the Sunnyvale facility will be shut down for four additional days next week.

FACT: ADR HAS THE ONLY HIGH PERFORMANCE RELATIONAL DATA BASE OPERATING TODAY.

Finally, after years of debate, the software industry agrees. Relational data base management systems (DBMS) are the future. They're far easier to use, modify and expand than the older systems.

Unfortunately, most software companies aren't capable of delivering a relational DBMS that delivers high performance. So instead, they add a few relational features to their old DBMS and call the whole thing a high performance relational DBMS.

It's not.

ADR/DATACOM/DB® is the world's only high performance relational DBMS. A single system that gives end-users the flexibility they need and still delivers the performance production demands.

For example, a large retail store chain uses ADR/DATACOM/DB to handle the processing of more than 25 million data base requests with more than 5 million updates. Daily.

And for a major insurance company, ADR/DATACOM/DB manages approximately 50 million records and processes more than 4.8 million updates per day. 85% of them on-line.

And they're not alone. ADR/DATACOM/DB is handling production applications every day at more than 1,000 installations worldwide.

In its latest release, we've improved ADR/DATACOM/DB's performance with new features like pipelining, improved data clustering and dynamic path analysis, significantly reduced load time and non-stop processing. Simply stated, it all means the world's fastest relational DBMS just got even faster.

It's no surprise ADR has the only high performance relational DBMS in the business. After all, we pioneered the single relational DBMS approach when almost everyone in the business said it couldn't be done.

The surprise is some people still insist it can't.

For more facts about ADR/DATACOM/DB mail us the coupon. Or call 1-800-ADR-WARE.

AT&T from page 1

one of many actions that are being taken to improve profits. Allen also said that further consolidations are likely and market conditions could lead to further cutbacks.

According to Kenneth M. Leon, an industry analyst with the New York investment firm of L. F. Rothschild, Unterberg Towbin, Allen's remarks concerning more cuts reflect uncertainty about market conditions over the next 12 to 18 months and "indicate a worst-case scenario of a recession."

The company said it has already identified 7,400 surplus jobs and has notified those employees of options available to them. Other affected employees "will be notified by mid-September if they are in surplus jobs," spokesman Tom Holub said. Affected employees will have the option of accepting financial incentives, including enhanced pension programs, or seeking transfers to other jobs within the AT&T organization, he said.

According to Roland Pampel, vice-president of systems marketing and development for AT&T's computer systems division, the layoff is an attempt by AT&T to streamline the company and eliminate unnecessary positions. "It's part of becoming a commercial business," he said.

Holub said the company was not able to estimate how many of the affected employees could find jobs in other areas and how many will eventually be laid off or retired. The cutbacks will cost between $800 million and $900 million this year but will reduce expenses next year "by hundreds of millions of dollars," he said. Reserves established prior to divestiture will absorb the costs this year, according to Holub.

The consolidation follows a July 1984 cutback of 11,000 positions at AT&T Technologies, the operating arm — one of two — under which AT&T Information Systems falls, and the June 1985 announcement of the elimination of 1,600 positions at AT&T Information Systems.

L. F. Rothschild's Leon said AT&T's new digital phone switches are being well received, but sales of those products are not offsetting the impact of customer conversion from analog to digital systems and the added pressure of a declining lease base. AT&T's 3B minicomputer line "is a little pricey" compared with competing products, but a soon-to-be-released 3B20C — which won the company a $946 million contract with the National Security Agency recently — "will be a little more competitive," Leon said.

According to both Leon and Kathryn Korostoff, an analyst with Northern Business Information, a New York-based telecommunications market research firm, the move was important to boost AT&T's profit margins. "This should give AT&T more room to cut costs," Korostoff added. Both analysts agreed that the jobs being eliminated are surplus positions that will not impact the company's ability to compete in the telephone and computer equipment markets.

Leon said that second-quarter sales of phone switches targeted at the office market were flat compared with first-quarter sales. But AT&T's Holub claimed that sales of the company's System/75 mid-size private branch exchange doubled in the second quarter compared with the first. Holub also reported a 35% increase in System/85 sales and a 20% increase in Merlin sales. Additionally, sales of the PC 6300 personal computer were up 60%, Holub said.

The jobs already identified as surplus were in the following divisions: 1,100 in the large business systems organization and 2,300 in the general business systems organization, both of which supply PBXs; and 4,000 in the consumer product organization, which markets residential phone equipment. Some of the consumer product cuts had previously been announced when AT&T said earlier this month it was closing a Shreveport, La., facility and replacing that factory's output of consumer phones with off-shore manufacturing resources.

Of the 24,000 jobs to be eliminated, 30% are classified as management positions, Holub said. Cutbacks will affect about 15,000 sales and support positions nationwide, 4,000 installation, maintenance and other technical support jobs, 3,000 product distribution positions and the 2,000 hourly workers at the Shreveport factory.

Following the consolidation, AT&T Information Systems will have approximately 93,000 employees nationwide.

IBM ships 3090s in volume

RYE BROOK, N.Y. — IBM last week announced it has officially begun volume shipments of its 3090 Model 200 mainframes.

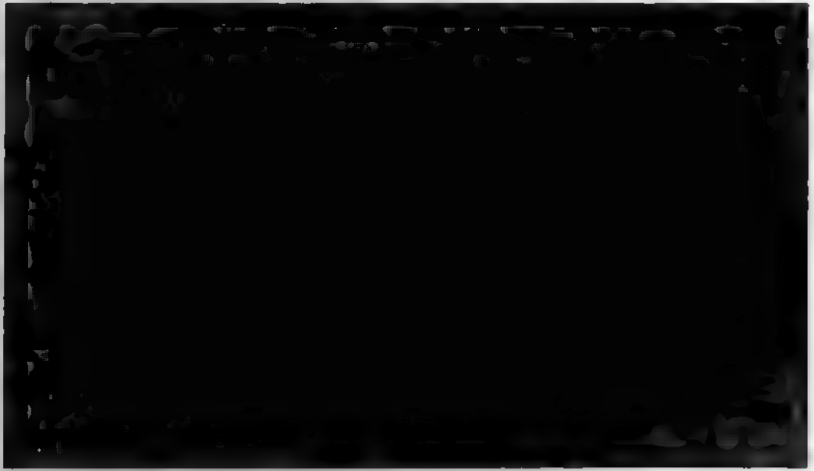
The first non-beta-site user of the system is Texaco. The 3090 will be installed at the the company's Bellaire Complex in Houston, IBM said.

First volume shipments of the 3090 Model 200, a two-CPU processor complex, are running about three months ahead of the schedule IBM originally announced when it unveiled the 3090 in February (CW, Feb. 18).

The improvement in the delivery schedule is believed to be an attempt by IBM to boost third- and fourth-quarter revenues in efforts to balance lower than expected earnings in the first and second quarters.

The 3090 is IBM's top-end mainframe series, the successor to its 3080 line. A second model of the 3090 line, a four-CPU Model 400, is not scheduled for availability until the second quarter of 1987. Many industry observers believe IBM will improve the delivery schedule on that processor as well. IBM is also expected to unveil a uniprocessor version of the 3090 within the next year.

The 3090 models use emitter-coupled logic circuit technology as opposed to the transistor-transistor logic circuits used in the 3080 series. The 3090 machines are the first IBM mainframes to use the company's 288K-bit memory chips. The 3090 Model 200 is said to offer roughly the same internal perfomance as the four-processor 3084 Model QX processor complex but at a much lower price. A 3084 Model QX costs roughly $6 million, while a 3090 Model 200 costs about $4.6 million.



AGREE from page 1

soft, the world's second largest micro software company behind Lotus Development Corp., is the developer of the MS-DOS operating system for the IBM Personal Computer, and Xenix, a Unix variant used on the Personal Computer AT and other systems. Microsoft said it is free to license products jointly developed with IBM to IBM-compatible and other manufacturers.

In anticipation of the agreement, Microsoft Vice-President of Systems Software Steve Ballmer said, the firm doubled the size of its systems software development group.

"This gives us a very clear opportunity inside IBM," Ballmer said. "It will enable us to hear openly about IBM's plans in some areas where it may have been difficult for us before."

Makers of IBM-compatible computers, or clones, welcomed the agreement as a boost to the overall industry. "If this means an advancement in technology, then we are all going to benefit," said Gail Soles, a spokeswoman for Corona Data Systems, Inc., a Westlake Village, Calif.-based maker of Personal Computer compatibles. "IBM comprises only about 10% of Microsoft's business, so Microsoft is going to continue to have to address the rest of us."

"I think IBM realizes there are other companies in the industry, like Microsoft and Lotus, that have quite a bit of talent and resources to offer," said Richard Levandov, vice-president of marketing at Phoenix Software Associates, Ltd. in Norwood, Mass., a manufacturer of compatibility tools. "IBM doesn't want to change the formula of working with an array of third-party companies."

Last week's announcement cemented a relationship that began in 1980, when IBM endorsed the MS-DOS operating system for what would become the world's standard microcomputer. That partnership will now continue on an even closer, more formalized basis.

"The agreement is really not surprising," said Frank Gens, an IBM analyst at the International Data Corp. in Framingham, Mass. "IBM can't afford to walk away from the DOS standard. In that sense, IBM is a slave to the industry standard that it has set."

CW Staff Writer Maura McEnaney contributed to this report.

CORRECTIONS

The Wang Laboratories, Inc. chart in the Aug. 19 Hardware Roundup incorrectly listed the VS85 cache memory capacity. The correct number is 32K bytes. Also, several prices in the IBM mainframe charts were inaccurate. The corrected figures are 3083 Model BX (16M), $1,155,000; 3083 Model JX (32M), $1,850,000; 3081 Model GX (16M), $2,190,000; 3081 Model KX (16M), $2,610,000; 4381 Model Group 3 (8M), $775,500; 4381 Model Group 2 (4M), $460,000; and 4381 Model Group 1 (4M), $340,400.

QUICK!

Name the fastest VM dump restore, and the fastest VM sort program.

(SYBACK & SyncSort CMS. What took you so long?)

Call (201) 568-9700.

Meet our supersonic systems.

If you didn't choose SYBACK and SyncSort CMS as the fastest in their categories, *do not* go directly to jail. But read this very, very carefully.

SYBACK, our fast dump restore for VM systems, and SyncSort CMS, the only high-technology sort for VM/CMS, represent a great technological leap forward. No other programs of their type can provide all three of the following positive advantages:

(1) THE FASTEST VM PERFORMANCE: SYBACK and SyncSort CMS make data move like greased lightning. Compared to their "competitors," these programs can save a tremendous amount of computer resources:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **55% in TTime;**
- **75% in SIOs.**

These savings are the result of our exclusive Fluid Buffering Technique (FBT) First developed in OS and DOS sorting, we've now extended the benefits of FBT to VM backups and sorts.

(2) THE BEST VM PRODUCTIVITY: SYBACK and SyncSort CMS have tremendous operational flexibility and user friendliness. They're rich in features designed to reduce human intervention in backup and sorting:

- **SYBACK**—Automatic backup based on CP directory • Stand-alone restore capability • Incremental backup facility • Catalog of backup operations • Multi-tasking and execution under CMS • Interactive command processing • Standard-label tape support • Callable by user programs • DASD to DASD conversion and copying. Much, much more.

- **SyncSort CMS**—Sorts CMS, SAM (OS or DOS), or VSAM files • Can be invoked from COBOL, PL/1 or BAL programs • Dynamically allocates disk space • Selects relevant records for sorting • Reformats records on output • Performs summaries of designated numeric fields • Produces reports with pagination; headings and dates • Can often produce simple reports in one day rather then, say, five. Much more, too.

(3) THE FINEST TECHNICAL SERVICE: Our Technical Service specialist are experts in their individual fields. You can count on fast, efficient, courteous service in both backup or sorting operations. More than 85% of all user requests for service are resolved within 24 hours.

CAVEAT EMPTOR: As with all performance software programs, the best way to find out what SYBACK and SyncSort CMS can do is to benchmark them yourself against your present programs.

That should help you make up your mind *fast!*

SYBACK • SYNCSORT CMS • SYBACK • SYNCSORT CMS • VM

CAMBRIDGE, Mass. — The enhanced version of Lotus Development Corp.'s 1-2-3 spreadsheet, due to ship in September, will remove the "key-disk" requirement for operation with hard disk drives and will provide limited support for the IBM PC Network, Lotus said last week.

Currently, 1-2-3 users with hard disk drive systems must insert a system disk into the A drive of their personal computers each time they use the program. The new version avoids that requirement, allowing the machine to boot from the hard disk drive, Lotus said. Users will be able to install the software on one hard disk drive at a time and to deinstall the product for use on another machine if that becomes necessary. A backup system disk also will be provided with each package of 1-2-3 Release 2.

A version of Symphony 1.1 that avoids the key-disk requirement will be offered this fall, available free to current users, the company said. Future Lotus products also will support that capability, the company said.

For users of 1-2-3 Release 2, PC Network support will mean the ability to read and write to 1-2-3 files that are stored on the local-area network file server. It will not mean the ability to share 1-2-3 among network users, however. Network support was not one of the features originally announced by Lotus in April when the company said it would enhance 1-2-3. Lotus said local-area network support was added at the request of users in large corporations, the market segment to which two-thirds of Lotus' sales go.

Limited local-area net support meets half the demand

In reaction, Paul Cubbage, senior industry analyst at Dataquest, Inc., a market research firm in San Jose, Calif., said the inclusion of even limited local-area network support answers half of the demand from corporate microcomputer managers for a local-area-network-compatible version of 1-2-3.

Cubbage said the other half of the demand is a version of 1-2-3 that can be shared on the network, something that he said will require the establishment of a site licensing program by Lotus. Overall, he said the release of 1-2-3 is "a nice evolutionary step" for the product.

The top-selling Lotus spreadsheet will remain priced at $495 when Release 2 arrives. Users who purchased the current version of the software, Release 1A, after April 24 will be able to upgrade to Release 2 for free. Registered users who bought the version before April 24 will be charged $150 for the upgrade.

Included in the enhancement, the product's first in two years, are such features as the ability to access up to 1M byte of additional memory and support of the Intel Corp. 8087 coprocessor, which works with the IBM Personal Computer's standard microprocessor to speed calculations.

Another feature of Release 2 introduced by Lotus was the addition of string functions for use with both text and mathematical formulas. A string function would allow users to search the spreadsheet for a name rather than only for a number.

The string function was one of the few new features of Release 2 that interested Alan Gross, president of the New York-based Microcomputer Managers Association. Gross, microcomputer manager for a New York investment banking firm, said that access to expanded memory is "of some importance to 5% or 10% of our user body," and network compatibility will affect no more than about 5% of personal computer users in most firms.

To improve further 1-2-3's use in reports, Lotus said, it will exclusively market the $150 1-2-3 Report Writer, written by Concentric Data Systems, Inc., of Westboro, Mass. A Lotus spokeswoman said the marketing of Report Writer marks the first time that Lotus has sold another vendor's software.

Report Writer, demonstrated along with 1-2-3 Release 2, will ship at the same time as does 1-2-3 Release 2, Lotus said.

DG adds link to Disoss, giving weight to IBM standard

By John Dix
CW Staff

WESTBORO, Mass. — Following the lead of Digital Equipment Corp., Data General Corp. last week announced it will support IBM's messaging architecture, a move that further promotes that architecture as a de facto industry standard.

DG's CEO Document Exchange Architecture (DXA) is the company's link to IBM's Distributed Office Support System (Disoss).

DXA, being released in two phases, will eventually enable users within DG's Comprehensive Electronic Office (CEO) environments to take advantage of Disoss document distribution and library services, according to communications products manager Joe Clabby.

The first phase of DXA provides an interface to IBM's Document Content Architecture (DCA) and Document Interchange Architecture (DIA), Clabby said.

DCA and DIA dictate, respectively, how messages and documents are structured and exchanged between computers.

By providing a connection to DIA and DCA, DG's DXA will provide mail and document distribution capabilities, the manager said.

DXA does not yet provide the integrated method to store, search and retrieve documents from Disoss libraries available with DEC's recently announced External Document Exchange with Disoss software [CW, July 15].

The only way to do that with DXA today is through emulation of an IBM 3270 display station.

In its second release, scheduled for the first quarter of 1986, DXA will be enhanced with an integrated Disoss link that will make an MV system look like an IBM network node.

"In phase two, we will better integrate the [Disoss] library function into the product, add [IBM] Physical Unit 2.1 support, expand the [IBM] Logical Unit 6.2 to the optional verb set and add [IBM's] Systems Network Architecture Distribution System support," Clabby said.

Translated into application, this will enable users on MV systems to access Disoss as if it were an IBM node and use all Disoss library functions, analagous to using a real library.

To implement DXA, users need to add a DG Intelligent Broadband Controller (IBC) to their DG Eclipse MV system in addition to the CEO DXA software.

The IBC intelligent synchronous board, which is installed internally, provides the IBM link, but the necessary transmission code conversions are done by the MV processor, Clabby said.

The IBC costs $6,500. The CEO DXA for the Eclipse MV/4000 DC and MV/4000 SC computers and DS workstations costs $1,500. For Eclipse MV/4000, MV/8000 and MV/8000 II computers, the CEO DXA costs $5,000. For Eclipse MV/10000 and MV/10000 SX computers, the cost is $6,500.

The first phase of DXA is available 90 days after receipt of order.

DG is located at 4400 Computer Drive, Westboro, Mass. 01581.

Bug found in Ultrix Microvax II

By Maura McEnaney
CW Staff

MAYNARD, Mass. — Just one month after its fanfare-filled introduction of the Microvax II, Digital Equipment Corp. stopped shipping versions of the machine running the Ultrix 32M operating system. The shipments were halted in June, after the company discovered problems with the machine's parity checking capabilities.

A spokesman for DEC said the company is currently working to find the source of the bug, which appears to be limited to Ultrix-based versions of the workstations. It is not known when shipments will resume. VMS-based Microvax shipments and the Ultrix-based Microvax I are not affected by the problem, the spokesman said.

John Forde, Microvax product manager in DEC's micro systems development group, told *Computerworld* that approximately 50 of the Ultrix Microvax II machines had been shipped when the company discovered the bug. The problem was present in five of the 50 machines and was occurring "every couple of days," he said.

According to Forde, "What appeared to be a failure in the operating system was a failure in the hardware but only under the Ultrix environment." The combination creates a memory parity bit error that requires users to reboot the machine and clear the system. "It appears that either the code sequence or the interaction of the code with the hardware creates a glitch in the machine." When that occurs, Forde said, the machine indicates that it will stop running.

DEC is working with users to pinpoint the problem, Forde said.

DEC's Ultrix operating system is based on the University of California at Berkeley's Unix 4.2.

IBM enters micro communications mart with modems

By Edward Warner
CW Staff

RYE BROOK, N.Y. — IBM introduced two low-speed modems last week that will put the computer giant in direct competition with companies such as Hayes Microcomputer Products, Inc. that have staked out the micro communications market.

Both IBM modems support full-duplex, asynchronous communications at speeds up to 1,200 bit/sec., and one also offers synchronous communications capability.

Although such products have been available from outside vendors since the IBM Personal Computer was introduced four years ago, this is the first time that IBM has offered its own modems for its machine.

IBM also announced discounts of 15% to 25% on high-volume Personal Computer maintenance agreements and a graphics-compatible version of the IBM Quietwriter printer.

Challenge to Hayes

IBM's belated entry into the Personal Computer modem market challenges longtime market leader Hayes of Norcross, Ga. An IBM spokesman said both modems are Hayes-compatible and can be used with Hayes Smartcom II communications software as well as with other non-IBM communications software packages, including Microstuf, Inc.'s Crosstalk XVI and Transporter and Dow Jones & Co.'s Dow Jones Market Analyzer, Dow Jones Market Manager and Dow Jones Spreadsheet link.

Although IBM introduced an internal modem for its PCjr when that ill-fated product debuted two years ago, the new modems, one external and one internal, mark Big Blue's first such offerings for its Personal Computer line.

In all, "the [IBM] strategy with Personal Computer modems is very similar to [its] strategy with mainframe modems," said John McCarthy, research manager for Forrester Research, Inc., a Cambridge, Mass., market research firm.

In both markets, he said, IBM was late to enter and offered a product that neither broke technological ground nor was priced less than the offerings of competitors. Prices of the IBM modems, he said, are nearly equal to those of the 2,400 bit/sec. modems for the Personal Computer being marketed by outside vendors.

IBM declined to comment regarding the products and prices of other modem makers.

The 5841, costing $800, is available immediately and reportedly supports both synchronous and asynchronous communications at either 600 or 1,200 bit/sec. A stand-alone unit, it interfaces with the Personal Computer and the IBM 3161 and 3163 Ascii display stations.

IBM said the 5841 has been tested for compatibility with the following IBM software for mainframe communications: Systems Network Architecture (SNA) 3270 Emulation, SNA Batch, Binary Synchronous 3270 Emulation and Display Communications Binary Synchronous Communications.

The other modem introduced, the IBM 1200, reportedly fits into an expansion slot inside the Personal Computer or the Personal Computer XT or AT. Priced at $495, the asynchronous modem will be out in September.

Both modems reportedly offer automatic speed detection — the ability to adjust to the speed of incoming data — as well as automatic detection of dial tones and busy signals and automatic line equalization, under which signal distortion is monitored and shared equally between transmitters and receivers as line conditions change. Self-diagnostics are built in, as are automatic redial and automatic dialing or manual dialing capabilities.

Also among the announcements were changes in the way that IBM will market service contracts for its Personal Computer and related hardware.

Foremost among these changes was the introduction of a Volume Maintenance Amendment, under which service contracts for 150 to 499 Personal Computers would receive a 15% discount. In addition, service contracts for 500 to 1,000 Personal Computers would get a 20% discount, and contracts for more than 1,000 Personal Computers would receive a 25% discount.

Among the other machines covered by the amendment are the Personal Computer XT, Personal Computer AT and the 3270 Personal Computer.

In another service-related move, IBM increased from nine to 32 the number of non-IBM personal computer hardware products that its national service organization will support, adding to the list such machines as Amdek Corp.'s Video 300 and 300A monitors and a variety of option boards from Tecmar, Inc.

The IBM Quietwriter Model 2 printer, meanwhile, reportedly offers the same features as the Quietwriter Model 1 but with all-points-addressable graphics capabilities. The printer, for use with the Personal Computer and other personal computers, prints graphics and text on standard paper. Priced at $1,595, it is available immediately.

IBM's Information Systems Group is located at 900 King St., Rye Brook, N.Y. 10573.

Seattle bank implements network overhaul

Upgrade eases switch in mainframe vendor

By John Dix
CW Staff

SEATTLE — The largest state bank here has completed testing communications products from start-up Doelz Networks, Inc. and is forging full steam ahead to install the technology throughout its network.

Seafirst Bank, the largest and one of the earliest customers of Doelz, is using the equipment in a major network overhaul to accommodate net growth and pave the way for new ventures, according to Timothy E. Turnpaugh, senior vice-president of Seafirst's operation technology division.

Besides playing a pivotal role in Seafirst's ambitious networking plans, Doelz's virtual circuit technology is providing an important ancillary benefit; it is greatly facilitating the bank's migration to a new mainframe vendor.

Seafirst will use Doelz's Elite One communications processors to upgrade its 167-branch statewide network. This is no menial task. The network supports processing minicomputers and terminals in each branch, 155 automatic teller machines and roughly 1,000 retail point-of-sale (POS) devices.

The overhaul is being made even more difficult by two other factors — Seafirst's central data center migration from Honeywell, Inc.'s processors to an IBM 3084 Model Q and the installation of Tandem Computers, Inc.'s processors to support ATM and POS terminals. The Tandem units will serve as front-end units to all ATM and POS devices and provide a gateway into the Northwest Electronic Network, a net consortium for POS and ATM terminals in which major Northwest banks are participating.

This was the design problem Seafirst faced: design a network that would facilitate future ventures and support disparate types of devices in the field, while providing access to three different processing systems in headquarters.

Each Seafirst office houses Honeywell branch control units that support teller and administrative terminals as well as one or two ATMs. Under its new master network plan, the bank decided to support each of these devices seperately. While the branch control units and ATMs could stand alone, the bank decided to install IBM 3274 controllers to support administrative devices.

Each of these device types uses different protocols. A proprietary protocol is used between the bank's host facilities and its branch processing units; the ATMs will use IBM Binary Synchronous Communications when they are detached from the branch control units; and the 3274s will use IBM's Synchronous Data Link Control protocol.

Instead of supporting these devices on separate networks — as the protocol hodgepodge would normally require — Seafirst wanted to support all of the devices on the same multidrop communications lines.

Additionally, the bank wanted to transform some of its branch offices into network hubs. The idea is to establish 70 key branches as network points of presence and build in enough reserve capacity to accommodate new services, Turnpaugh said. This will enable the bank to bring up services from remote hubs instead of having to reengineer circuits all the way back to headquarters. The savings in implementation time alone could be 25 days or more.

Doelz's Elite One offered many of the features needed to meet all of these requirements, according to Robert J. Bowman, vice-president and manager of network services. "The Doelz box provides all the protocol transparency approaching that of a time division multiplexer, with throughput approaching that of a statistical multiplexer," Bowman said.

In initial tests, Seafirst installed a master Doelz Elite One in its headquarters and two other Doelz boxes in remote branches (see diagram). The master Elite is connected to the older Honeywell processors, the new IBM hardware and the Tandem equipment. Each branch Doelz box supports a 3274, an ATM and two branch control units.

The branches are supported on a 9.6K bit/sec. multidrop link that stops first at a branch in Burien, Wash., and then hops over to the Renton, Wash., branch. Because the Doelz equipment provides throughput similar to a statistical multiplexer, the equipment on the 9.6K bit/sec. line is run as if it were a 14.4K bit/sec. link, Turnpaugh said.

The Doelz boxes provide multiple virtual circuits over this single line, fooling attached devices into thinking each has a dedicated link. The ATMs and 3274s have their own virtual circuits. All of the branch controllers in the test share one virtual circuit as if it were a dedicated multidrop line.

An appealing feature of the Doelz equipment, according to Turnpaugh, is limited fault bypass — what the bank calls self-healing. The Renton branch in the experiment — sitting at the end of the multidrop line — has a dedicated backup link to headquarters. In the event that the main link goes down, traffic is automatically reversed and routed over the alternate facility. Eventually that capability will be provided over dedicated or dial-up lines from the last Doelz box on most multidrop lines, Turnpaugh said.

The Doelz experiment was meant to test the mainstream tasks that Seafirst's fully deployed network would be expected to handle. As such, the test supported 65 Honeywell terminals hung from four branch controllers; two Docutel/Olivetti Corp. ATMs; two IBM 3274 controllers; and two Apple Computer, Inc. Macintosh microcomputers.

The Macintoshes emulate Digital Equipment Corp. VT100 terminals through a protocol converter, which appears to the IBM 3274 like an IBM 3178 display station. The Macintoshes will be used for administrative, nonteller functions, with the 3274s providing the gateway for such things as access to corporate electronic mail and access to an IBM DB2 4.5M-byte data base.

Of the roughly 180 Doelz communications processors to be installed, about 30 have been put in place, Turnpaugh said. The senior vice-president would not divulge the value of the contract but noted that the bank would realize a six-digit savings by engineering with the Doelz equipment instead of time division multiplexers.

While the Doelz hardware is enabling Seafirst to migrate gracefully from Honeywell to IBM processors, other features are perhaps more important. The Doelz network infrastructure — providing the ability to support multiple protocols and build in reserve capacity — will enable the bank to react and provide service on a marginal cost basis, Turnpaugh said. The self-healing feature will ensure uptime.

AI

from page 1

Addressing this concern, Symbolics, Inc., the leading supplier of AI workstations, outlined a new and widely expanded delivery strategy at IJCAI. Options will include upcoming low-cost dedicated Lisp machines; multiuser setups for existing Lisp machines via direct connection or networking; use of dedicated systems as "back-end knowledge servers" on a net; and cross-compiling Common Lisp code to run on general-purpose machines.

Like others interviewed here, Geisel suggested several other likely alternatives for future AI delivery vehicles. One is Digital Equipment Corp.'s Microvax II, which could act as a single-user development machine and then be upgraded with several terminals for running applications. Another option, he said, will be "the fabled 32-bit IBM workstation," with a reduced instruction set computer design the most promising architecture, he remarked. The next generation of personal computers also will find a role. And to round things off, Geisel predicted, dedicated AI coprocessors will be widely available within three years.

"AI is much more exciting now than it's ever been," according to keynote speaker Woody Bledsoe, AAAI president and vice-president at Microelectronics & Computer Technology Corp., and IJCAI's overall mood was as sunny as its Southern California location would suggest. But notes of caution kept cropping up.

Many tasks now suggested for AI systems will prove extremely difficult to accomplish because they deal with what Hector Levesque of the University of Toronto described as "incomplete knowledge." Such problems require the computer to deal with "all those nasty things that you have to do when you take a logic course," Levesque said. "These limits exist, and it's easy to forget [them] among all the hysteria about knowledge-based systems."

May not find widespread business use

Even when the technology is appropriate, an AI-based system may not find widespread use in business, said Beau Sheil, manager of product development at the Artificial Intelligence Systems division of Xerox Corp. "In most Fortune 500 companies, there is an advanced development group doing the strangest things," Sheil said. "But in some of them it's just not going to work."

Successful adoption of AI technology requires a corporation to have "longtime horizons, real clear ideas about what [its] needs are and a long history of successfully applying technology to those problems," Sheil said. Petroleum services firm Schlumberger Ltd., one successful user of AI technology, "has been at it for five years now, and [it's] just now shipping in bulk to field operations," he pointed out.

As in other high-technology fields, there are also signs of growing friction in the AI community between academia and industry. One sore point is the continual movement of talent into industry, which may slow down emphasis on basic research and make in-depth training much more difficult, researchers said. "There's a tremendous wave of really bright kids coming into college but not that many good AI professors," Bledsoe said.

IBM, NYU join forces

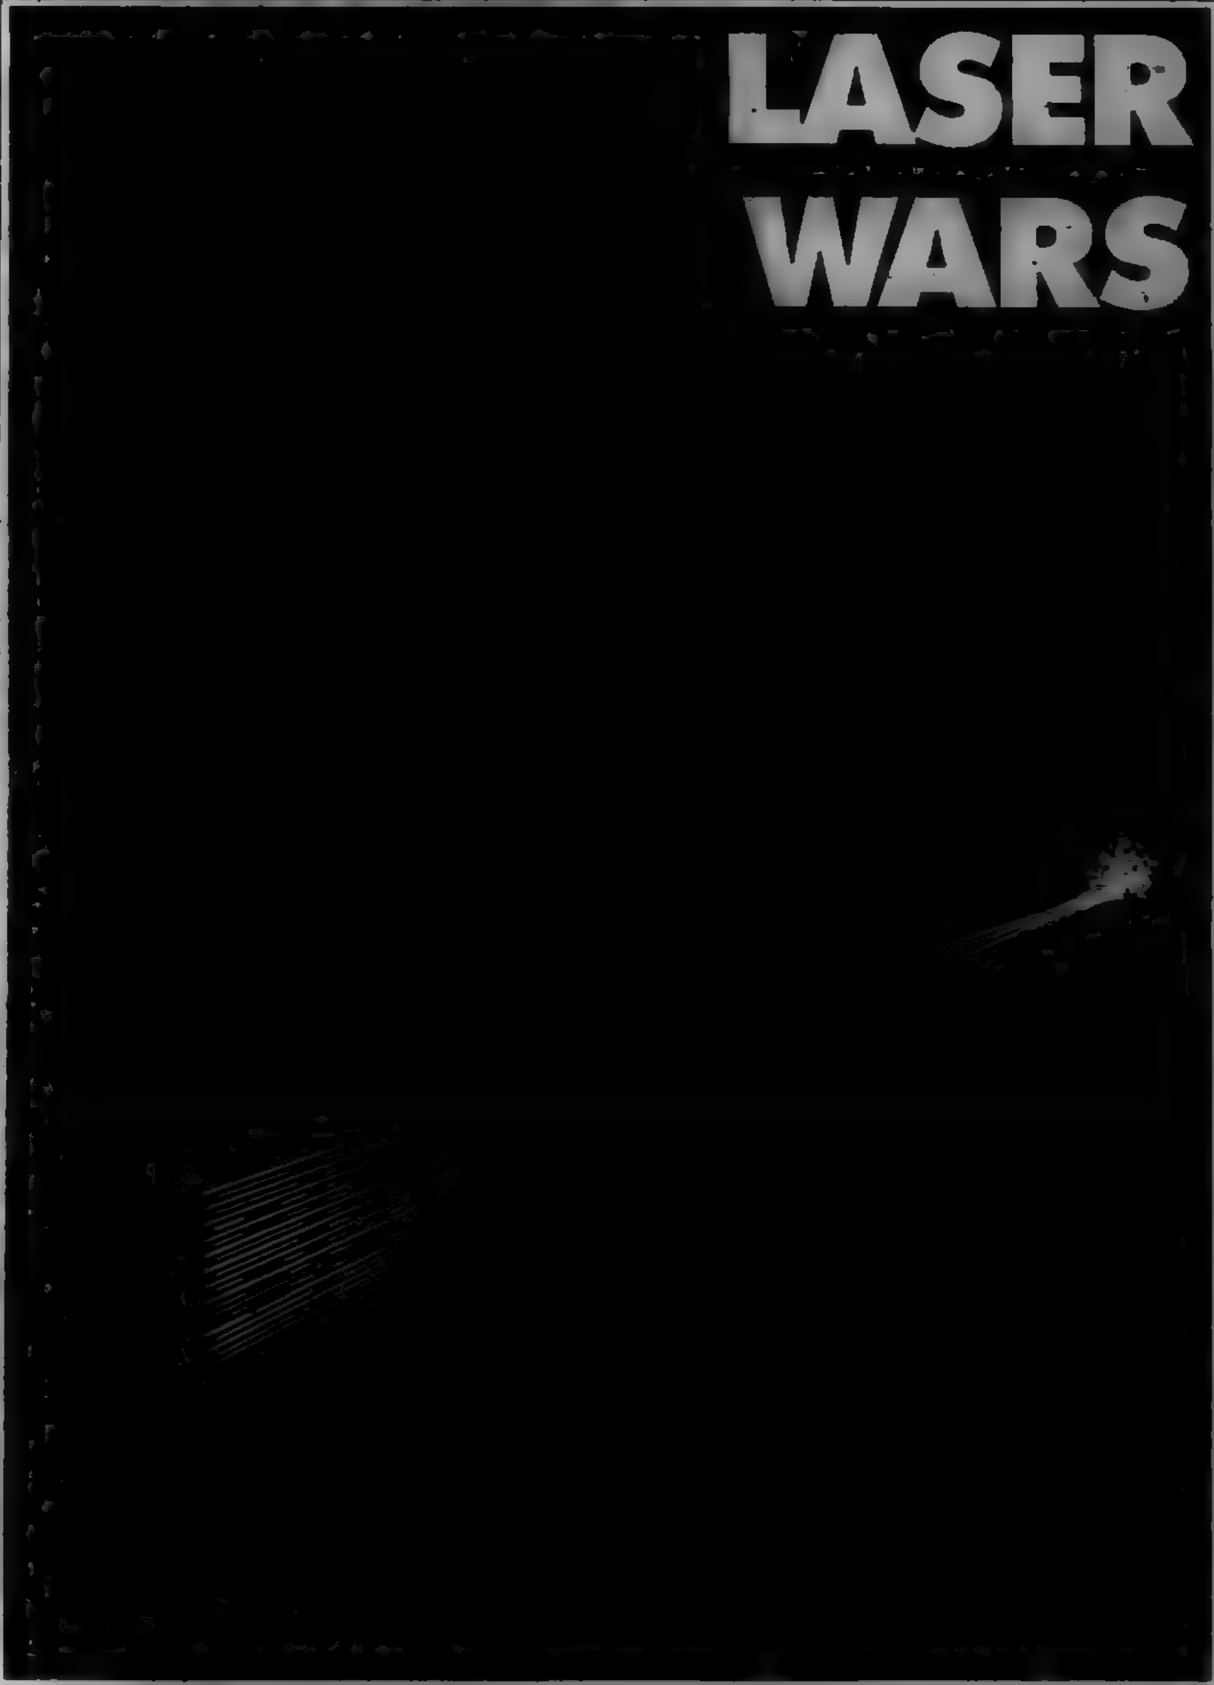
NEW YORK — IBM and New York University (NYU) have teamed up to pursue a two-year project to build a parallel processing computer, the experimental RP3.

The Research Parallel Processor Project will combine experimental 32-bit microprocessors into 64-processor units. When eight of the units are interconnected, they will become a 512-processor system with each processor linked to 2M or 4M bytes of memory, IBM spokesmen said.

An operating system devised at the Courant Institute of Mathematical Sciences at NYU has incorporated a synchronized fetch-and-add technique that bundles multiple requests for the same piece of data, retrieves it once and then broadcasts it to all requesting processors, IBM spokesmen said.

Coordination among the processors is to be handled by an interconnection network capable of moving packets of data at a maximum rate of 13 billion char./sec.

The system is being designed to address the need to work on a variety of complex problems, IBM said.



IJCAI sees HP, Intellicorp moves in AI programming

CW AT IJCAI

By Eric Bender
CW Staff

LOS ANGELES — The International Joint Conference on Artificial Intelligence (IJCAI), held here last week, saw a string of significant product introductions from existing AI suppliers, plus an announcement of strong commitment to AI development from one major industry player.

Hewlett-Packard Co. chose IJCAI to announce a major push into the AI programming arena.

HP's initial AI software offering, available by year's end, will be a Common Lisp development environment that runs on the HP 9000 Series 300 family of workstations announced last month. The software includes a compatible interpreter and compiler pair with an integrated debugger, Emacs editor and multiple user windows. It also provides a system interface called Browsers that is said to enable users to move freely from one part of the system to another and automatically have appropriate tools for the task at hand. Access to Fortran, Pascal and C programs also is supported.

A high-end development system based on the Model 320 workstation and running the HP-UX version 5.1 operating system will be priced in the $50,000 range. Costs for a delivery system based on the Model 310 will begin at under $20,000. More information is available from HP at 1820 Embarcadero Road, Palo Alto, Calif. 94303.

Xerox workstations

Releasing low-cost workstations (see story page 11), Xerox Artificial Intelligence Systems also climbed on board the Common Lisp bandwagon, with plans to offer Common Lisp software in second-quarter 1986. Other suppliers that announced Common Lisp product plans include Sun Microsystems, Inc. and Franz, Inc., whose Franz Lisp product is said to be the world's most widely distributed Lisp dialect.

Among other software introductions at IJCAI, Intellicorp unveiled a PC-Host system said to enable personal computers to act as delivery vehicles for expert systems developed with the firm's Knowledge Engineering Environment (KEE) software. In the distributed system, the micro handles KEE interface functions while the host computer runs a Common Lisp version of KEE core functions, the company said.

The initial version of PC-Host supports IBM Personal Computers and compatibles and the Apple Computer, Inc. Macintosh on the desktop side and Digital Equipment Corp. VAX systems as hosts. Scheduled for delivery in January, the software costs $15,000 for the host and $495 for the personal computer.

Intellicorp also unwrapped KEE Release 3.0, scheduled for January availability, and Simkit, a $15,000 graphics-oriented simulation tool that will be delivered in October. More information is available from Intellicorp at 1975 El Camino Real W., Mountain View, Calif. 94040.

One AI-based application that grabbed the spotlight was Palladian Software, Inc.'s Financial Advisor package, which Chairman Philip Cooper described as "the first-ever commercial, large-scale expert system designed for general marketing to American corporations."

The Financial Advisor is targeted at assisting executives in planning, formulating, evaluating and monitoring capital-intensive projects and products. The package combines financial, economic, tax and accounting expertise with sophisticated mathematic techniques, Palladian said.

The Financial Advisor is designed for users without specialized financial or computer knowledge, Cooper said. During problem defini-

Symbolics, Xerox offer enhanced AI workstations

CW AT IJCAI

By Eric Bender
CW Staff

LOS ANGELES — Dedicated artificial intelligence workstations said to offer significant price/performance increases over their predecessors from Symbolics, Inc. and Xerox Artificial Intelligence Systems made their debuts at last week's International Joint Conference on Artificial Intelligence (IJCAI) here.

Symbolics, which claims about two-thirds of the dedicated AI machine market, enhanced its 3600 line with two systems offering performance improvements of up to 50% over their predecessors, said to Symbolics' marketing director Howard Cannon.

The new 3645 and 3675 models feature an Enhanced Performance Option, available as a $16,750 upgrade to the earlier 3640 and 3670 models.

With 4M bytes of internal memory and a 190M-byte disk drive, the 3645 costs $81,900. The 3675, with 4M bytes of memory and a 474M-byte hard disk drive, is priced at $113,000. Shipments of the machine and the upgrade are scheduled to begin in October.

Symbolics also disclosed plans to offer, within a year, low-end models, designed primarily as delivery vehicles and costing about half as much as current models. Most of the company's customers are currently developing rather than delivering AI applications, and the announcement was made to let them know that a relatively inexpensive delivery vehicle is on the way, President Russell Noftsker commented.

Along with its workstation debuts, Symbolics introduced Release 6.1 software, said to feature a technique for saving disk space, a lexically scoped debugger and other enhancements.

Additionally, the company announced a dot matrix printer with a base price of $2,995, a $9,995 laser printer, base-level support of Digital Equipment Corp.'s Decnet network standard and a slew of marketing agreements with software firms.

More information is available from Symbolics at 11 Cambridge Center, Cambridge, Mass. 02142.

Xerox Artificial Intelligence Systems rolled out two workstations that represent the lowest cost machines designed specifically to develop and run Lisp programs, according to general manager Gary Moskovitz.

He described the new Xerox 1185, which costs $9,995 with Xerox Interlisp-D run-time software, as "the first real Lisp delivery vehicle."

The 1185 comes with 1.1M bytes of internal memory and a 10M-byte hard disk drive. The Xerox 1186 development system, which can be expanded with up to 3.6M bytes of internal memory and 80M bytes of hard-disk storage, costs $15,965. Both systems are offered with an optional $750 coprocessor for IBM Personal Computer software and will be available next month.

More information is available from Xerox at Xerox Centre, 101 Continental Blvd., El Segundo, Calif. 90245.

IJCAI

from page 10

tion the software reportedly checks for errors, omissions and reasonableness of data.

The Financial Advisor comes in two modules — a data base management and communications portion that runs on large IBM and Digital Equipment Corp. systems and a workstation portion that runs on Symbolics, Inc. and Texas Instruments, Inc. Lisp machines.

A system for four workstations costs $95,000. The software is set for commercial delivery in December.

Palladian Software is located at 11th Floor, Four Cambridge Center, Cambridge, Mass. 02142.

Artificial Intelligence conducted by America's

For companies, universities, laboratories, or any organization investigating AI. A simple hookup brings the Symposium into your conference room, auditorium...or even your office. On November 13, 1985

Texas Instruments believes AI to be of such broad significance that we are sponsoring a full day's TV satellite symposium on the subject . . . And it's free.

The title of the Symposium is *Knowledge-based Systems and Their Applications*. It's a rich mix of tutorial material, panel discussions, and telephone questions and answers.

Who should attend.

It's designed for technologists and far-sighted managers who may be already immersed in expert systems, or just beginning to explore their potential. People in your organization who follow the general literature and now want specific, practical information relevant to their problems.

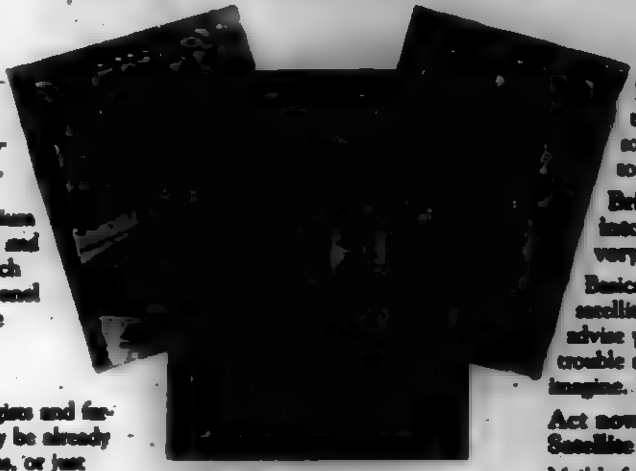
Attendees with some technical background will benefit most. But computer-savvy business managers will find it well worth their time too.

So, if you bring the seminar into your facility, invite a broad audience. This is a great opportunity to bring everyone interested in AI right to the forefront of the state-of-the-art.

Here's what you will learn.

In seven learning-intensive hours you will review the basic terms and concepts of knowledge-based systems.

You will learn about the role of the "knowledge engineer" in molding an expert system. You'll begin to understand the ground rules, constraints, and which applications are likely to succeed. You will overview hardware and software tools. You will grasp the resources it takes to do an AI project.



A 3-book offer that ensures a meaningful learning experience. Available at only $49.95.

Basic books for your AI library: *The AI Satellite Symposium Notebook*: Includes visuals for each presentation; minimizes your need to take notes. *Understanding Artificial Intelligence*, H.C. Mishkoff (foreword, E.A. Feigenbaum): Helps translate AI information into practical applications. *The Fifth Generation*, Feigenbaum and McCorduck. Involves you in AI's technical, economic, and social issues. Send the coupon to get details.

Bringing the Symposium into your organization is very easy.

Basically, you need to have a satellite dish. If you don't, TI can advise you on how to do it. It's less trouble and expense than you imagine. Details in the Info-Pack.

Act now. Send for your AI Satellite Symposium Info-Pack.

Mail before September 30th so you'll have enough time to make the arrangements.

TEXAS INSTRUMENTS

Creating useful products
and services for you.

Mail To:
Texas Instruments
AI Satellite Symposium
P.O. Box 470065
Dallas, Texas 75247

Yes, my organization is interested in receiving the AI Satellite Symposium. Please send me the AI Symposium Info-Pack with all the details.

Meet provides forum for software debuts, upgrades

CW AT INFO CENTER

By John Gallant
CW Staff

NASHVILLE — The scene was reminiscent of the old days on the computer industry conference circuit. Whether the driving force was the growing importance of information centers within many companies or the shift by marketers toward more narrowly focused trade shows, a variety of vendors used last week's Information Center Conference & Exposition here as a forum to announce products and enhancements to existing tools.

Among the software happenings, which included the debut of user training courses from at least three of the major educational products companies (see story page 13), was the introduction of an IBM mainframe-based word processing package from Group 1 Software. Group 1's EZ-Word, which operates under IBM's CICS, provides users with features such as insertion and deletion of copy, search and replace, movement of text within and between documents, full formatting capabilities and pagination.

The product can be used with list management or other programs — such as Group 1's EZ-List or EZ-Letter packages — to create letter-quality documents and form letters with variable inserts. EZ-Word enables users to share documents with other terminal users and is fully menu driven. The package is available now at a cost (perpetual lease) of $30,000 for IBM DOS environments and $40,000 for IBM OS environments. Group 1 Software is located at 6186 MacArthur Blvd., Washington, D.C. 20016.

Information Builders, Inc., whose Focus fourth-generation language is a mainstay in many information centers, gave users of that product an interface to IBM's DB2 relational data base management system.

The interface will allow Focus users under IBM's MVS/TSO to access DB2 tables. Users can execute Focus' reporting and data analysis functions, such as report writing, ad hoc queries, statistics and financial modeling, against DB2 data bases. The interface also allows users to join up to 16 different DB2 tables relationally as well as join the DB2 tables with other files, including Focus and IBM's Vsam, Qsam and IMS. Data from DB2 files can be downloaded to IBM Personal Computers with Information Builders' Foctalk link. The Focus/DB2 interface is scheduled for October availability. It will be priced at $8,500. Information Builders is located at 1250 Broadway, New York, N.Y. 10001.

Comshare, Inc., producer of the System W decision support system, also unveiled an interface to one of IBM's major products. The company introduced an interface — dubbed W/SQL Pipeline — between System W and IBM's SQL/DS data management system.

W/SQL Pipeline reportedly provides a data view from System W to SQL/DS data bases allowing either read-only virtual access or extraction of data from SQL/DS into System W. The interface features use of SQL/DS's security, concurrency and data dictionary capabilities and full screen facilities for viewing SQL/DS data using W/Datman, System W's relational data management facility. W/SQL Pipeline runs on IBM mainframes with SQL/DS Release 2 or 3 and a minimum System W configuration with W/Datman. The interface is available now for $7,500. Comshare is located at 3001 S. State St., Ann Arbor, Mich. 48106.

Gateway PC link

SCA Products & Services, Inc. chose the gala here to release an enhanced version of its Gateway PC micro-mainframe link. According to a spokeswoman, Gateway PC supports data transfer between additional mainframe and micro packages, including IBM's TSO and Lotus Development Corp.'s Symphony.

Gateway PC uses menus and screens to give users access to applications and data on the micro and mainframe. The link automatically builds 1-2-3 and Symphony spreadsheets from mainframe data and formulas. It runs on the IBM Personal Computer, XT and AT and includes a mainframe module that operates under IBM's CMS or TSO. The enhanced version is available now at a cost between $200 and $350 per micro and $18,000 for the mainframe module. SCA Products & Services is located at 353 Lexington Ave., New York, N.Y. 10016.

Chicago-Soft, Ltd. announced its 301 system, which consists of three products for micro-mainframe connection. ARX-Link allows IBM Personal Computer users to access mainframe data files selectively with automatic reformatting for micro packages. The second 301 component, ARX, provides for selective and incremental backup and restore of micro data files on a mainframe using a master IBM Vsam file. The package can run in unattended mode so backup can be done in off-peak periods. Control-PC, the final module, allows users to build a central repository of

Announcements spotlight concern for user training

CW AT INFO CENTER

By John Gallant
CW Staff

NASHVILLE — Reflecting the increasing role of information center personnel in user training, at least three major vendors chose last week's Information Center Conference & Exposition as a springboard to launch educational products.

Advanced Systems, Inc. introduced four training courses employing a variety of instructional techniques. A microcomputer diskette- and videotape-based course called "Learning to Apply Symphony" helps users learn five basic functions, including spreadsheet and word processing, of Lotus Development Corp.'s Symphony integrated software. The course includes two videotapes, a data diskette and viewer's guide.

An eight-unit video course titled "IDMS Goldengate: Cullinet's PC Software" teaches users to master the information manager, edit, spreadsheet, graphics, profile and emulator tools of Cullinet Software, Inc.'s Goldengate micro software. Advanced System's "CMS (Xedit)" six-unit computer-based training (CBT) course offers instruction in IBM's CMS and Xedit mainframe software products.

Each of the training courses can be rented for $50 per month per module.

Advanced System's "Personal Consultant" interactive videodisk instruction course, which can be rented for $90 per month per module, is designed to teach novices to use microcomputers. Advanced Systems is located at 155 E. Algonquin Road, Arlington Heights, Ill. 60005.

Course hones writing skills

The Phoenix Courseware Group of Goal Systems International, Inc. unleashed two CBT tools at the conference. "Effective English for Business Writing" is a CBT course designed to help users hone their writing skills. It is priced at $4,900 for a permanent license fee.

"Ease/Instructor" is said to help instructors and training managers plan and administer CBT courses. "Ease/Instructor" costs $3,200 for a permanent license. Phoenix Courseware Group is located at 5455 N. High St., Columbus, Ohio 43214.

Deltak, Inc. offered four new training courses, including the following:

- "Symphony," a two-course video series with training exercises for users of Lotus' Symphony. The package costs approximately $125 a month.
- "Analyzing Sales Performance Using the Lotus 1-2-3 Program," a micro-based CBT course aimed at sales professionals and management. The course costs $70 per diskette.
- "Talk English to Computer with Intellect," a one-hour video course for users of Artificial Intelligence Corp.'s Intellect. The course carries a rental charge of approximately $125 a month.
- "Working Effectively with the Information Systems Department," a five-course video series for end users and MIS managers. The rental charge for the course is approximately $125 a month.

More information is available from Deltak, East-West Technological Center, 1751 W. Diehl Road, Naperville, Ill. 60566.

DEBUTS

from page 12

micro software stored on the mainframe, allowing access to the packages only to authorized users. The package tracks software use by user.

ARX-Link uses IBM's CICS and supports most IBM 3278 emulator boards, 3274 emulators and protocol converters. Base pricing begins at $12,500 for DOS/VSE and at $30,000 for MVS.

Chicago-Soft is located at Suite 2, 738 N. LaSalle, Chicago, Ill. 60610.

ATTEND THIS FREE SEMINAR TO GET THE EDGE IN PRODUCTIVITY AND PERFORMANCE

Logic Programming and Expert Systems for Advanced Software Development

This valuable seminar program is sponsored by Logicware Inc., a leading developer and supplier of Logic Programming and Knowledge Based Expert Systems Shells. Register today to discover how these profitable new business technologies are helping companies like yours to develop and implement more advanced software for a full scope of applications.

Simply complete and mail the Registration Request, or call Carol Charlesworth direct at (416) 665-0022.

We're Coming to Your Town

Los Angeles — Sept. 10
Raleigh — Sept. 11
Sunnyvale — Sept. 12

Seminar Agenda

8:30 – 9:00 am Registration
9:00 – Noon "An Introduction to Logic Programming and Knowledge Based Expert Systems"
Using simple case studies, we'll demonstrate some of the many lucrative applications of Logic Programming. Learn about MPROLOG, a portable, user-friendly version of the language endorsed by Japan's 5th Generation Computer Project and many multi-national corporations to bring Expert Systems on-line. You will also discover how MPROLOG can be utilized to implement Explanation Systems, Natural Language applications and Rapid Prototyping through Logic Programming. The seminar will conclude with suggested strategies for getting on the road to dramatic increases in performance and productivity.

YES, I want the edge in Software Development!

☐ Please register my name for this no-obligation seminar.
☐ I cannot attend, but please forward more information about MPROLOG.

Compatibility, integration key to info center tool choice

CW AT INFO CENTER

By John Gallant
CW Staff

NASHVILLE — What are the most important factors to consider in selecting software for an information center?

If you said price, functionality or vendor reputation, you are off the mark. But if compatibility and ease of integration with other software products topped your list, you are correct — at least according to the panel of top information center professionals who spoke at a forum on software selection at last week's Information Center Conference & Exposition here.

All the panelists, whose information centers support end-user populations ranging from approximately 200 to nearly 1,000, agreed that a product's ability to fit into an existing information architecture and to share data with other packages are the most important factors in their software selection decisions.

"We are not overly concerned with price," said Kenneth Barton, information center manager for the Vancouver, B.C.-based airline CP Air. "We have a big investment in hardware, and software is a relatively small component of the overall cost of workstations. Connectability and integration are the key issues."

Primary concern is integration

Kenneth Baker, manager of end-user computing and office automation for Lexington, Ky.-based Ashland Oil, Inc., echoed Barton's point. "Price is way down the list. Our primary concern is the integration of all the products we support. We have to have the ability to interchange data," Baker said.

Doug McGregor, senior information center specialist with London Life Insurance Co., London, Ont., said, "What we ask is 'How does this product relate to the rest of our product line? Can we move data around with it?' We don't have any more stand-alone personal computers. Integration, data transfer and compatibility are the vital issues involved here."

As a result, McGregor said, he would relish the opportunity to start from scratch.

"We would love to have a clean slate. We are using old, tired products that overlap functionally," he said. "If we could start over again, we would take a hard look at organizing our product line. I recommend that people just starting information centers think carefully about the products they want to have in place two years from now, especially considering the data communications aspects."

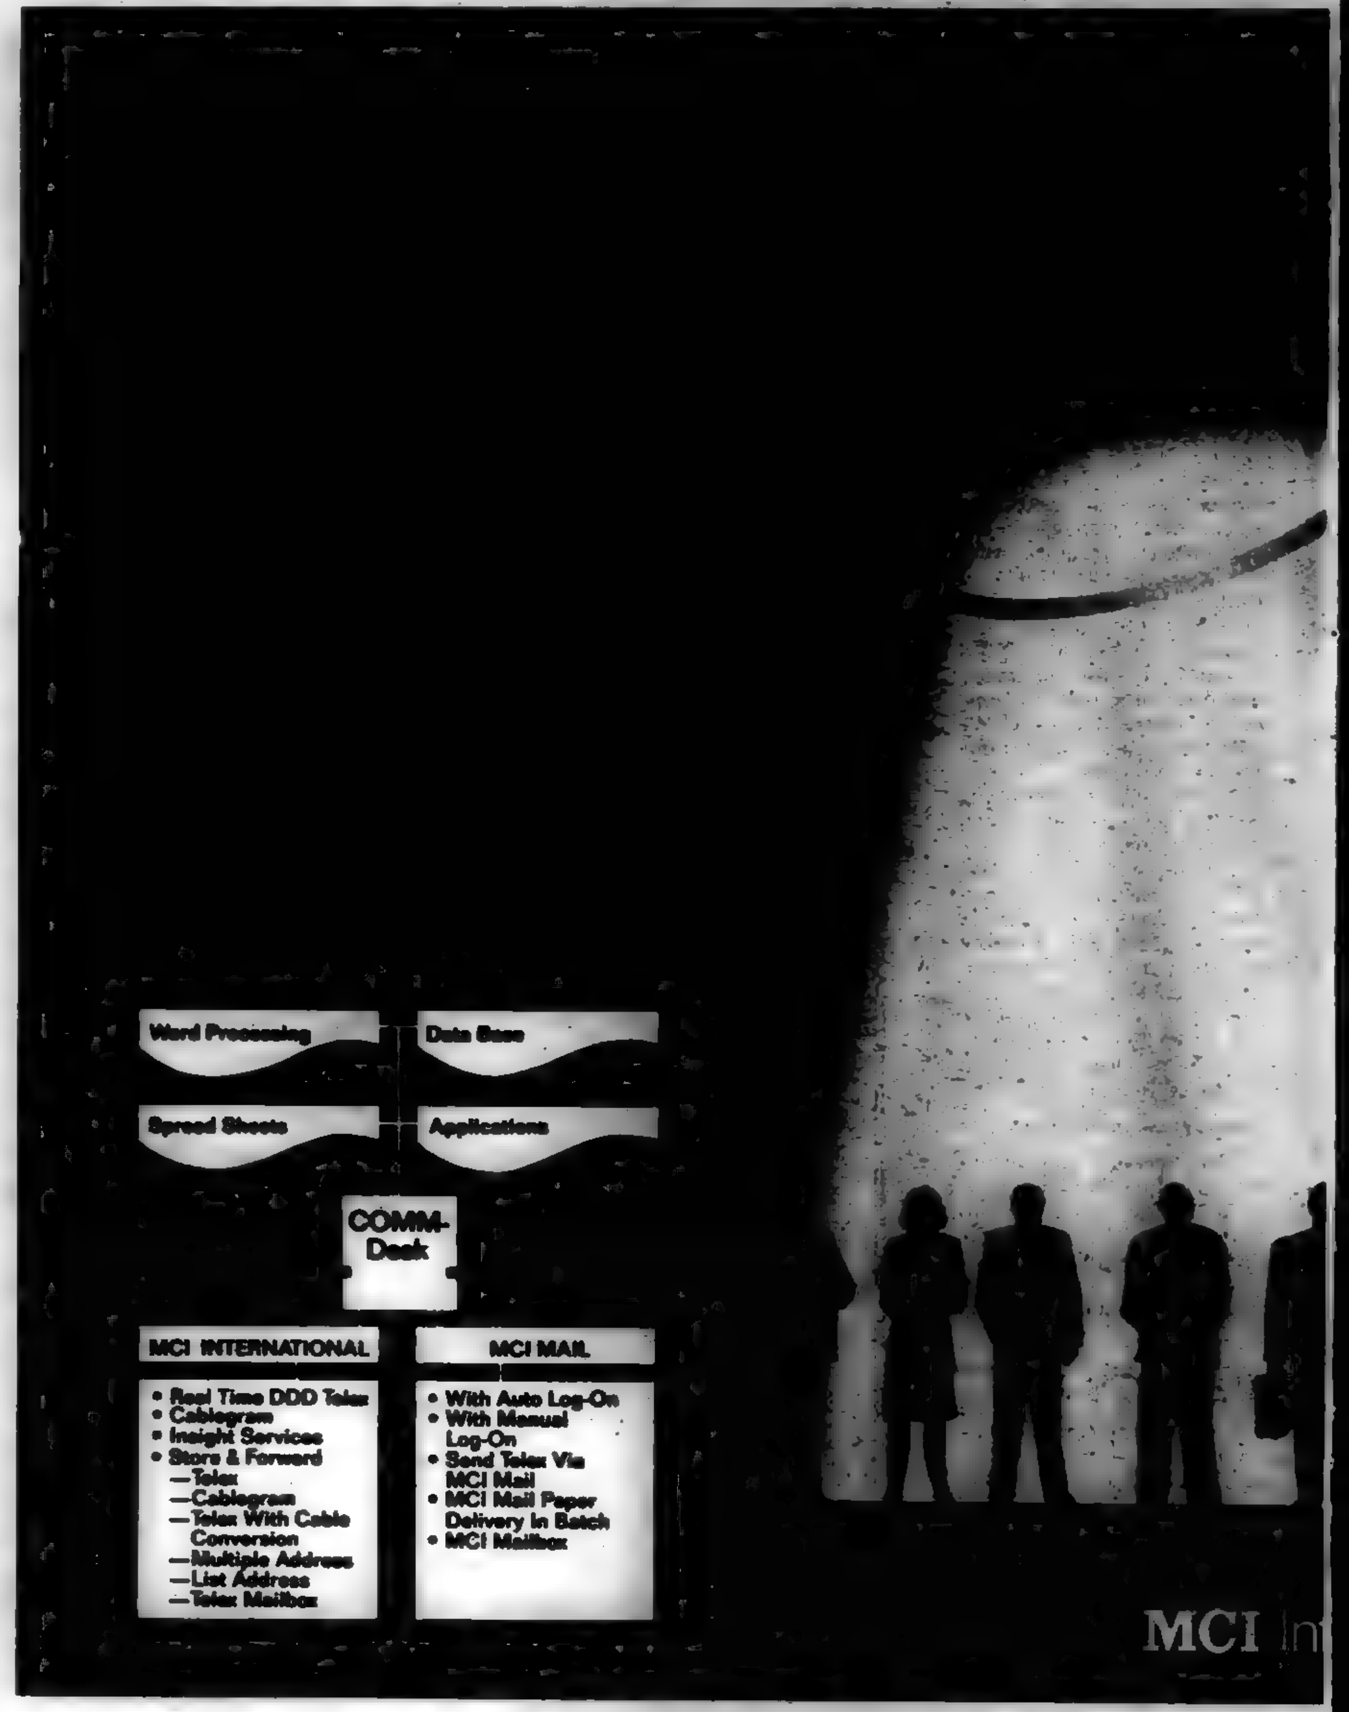
Barton said the quality of vendor-supplied documentation and other training materials has taken on a new importance. "As our users get more geographically diverse, documentation is becoming a more important factor in the selection process. As it becomes more difficult to support individual users, the training materials take on a new significance," Barton said.

Where the information center professionals differed was on how they select the standard products they offer to their end users.

McGregor said that while his technical staff stays up-to-date on new products, the evaluation and selection process is primarily user driven. "The users ask us for certain capabilities and products, and we do the research," he said.

That approach contrasted with CP Air's information center, which, Barton said, takes a leading role in seeking out new products.

"Everyone's information center is different," Barton said. "We are proactive. We try to lead our users to products that we think will boost their productivity. In a sense, we are dragging users to certain products."



M&D

from page 1

viewed at last week's conference were positive about the Millennium enhancements. Citing prior complaints that Millennium 1 has a seemingly voracious appetite for machine resources, the users were especially happy with promised improvements.

In opening remarks at the conference, attended by about 1,700 users, M&D President Frank H. Dodge called AR:M "the best product M&D has ever produced."

Mickey Clark, AR:M marketing manager, said eight people worked two years to develop the product. Many of the Millennium upgrades resulted from the AR:M development effort, he said.

To market in 1983

Millennium was brought to the market in 1983 as M&D's integrated system for developing on-line applications. Data input and query interfaces are consistent across Millennium applications. An M&D spokesman said 1,870 Millennium packages for on-line development have been shipped.

Enhancements in Millennium 2 include an interactive screen design feature that allows interactive building and modifying of screens, a spokesman said.

With the Quick Commands feature, users can now devise simple commands for use with any Millennium application. A Help Redirection feature lets users display actual values along with text.

A Data Macros feature allows calculations to be performed on specific fields for greater flexibility in executing queries and using M&D's Interactive PC Link micro-mainframe package.

The AR:M package will initially be available for IBM MVS and DOS operating systems and IBM's IMS data base management system.

AR:M requires Millennium 2 and will cost approximately $100,000, a spokesman said. An international version of the package will be available at a later date.

Dodge said the company is now working on Millennium 3, which, he said, "will be more integrated with data base management systems than prior versions." Robert D. Kelley, M&D's vice-president of product strategy, said Version 3 will be more relational in nature and will be compatible with IBM's DB2 and SQL.

In what a company spokesman said was an important feature for users with investments in their own or packaged non-M&D software, Millennium 2 offers an optional Batch Transaction Processor (BTP), said to translate automatically non-Millennium transaction records into Millennium-understood files.

For example, BTP could be used to reformat a company's in-house or non-M&D billing system into a format accessible by AR:M, Kelley said. The BTP option will cost $15,000.

William Fitzpatrick, M&D's new product development manager, said that with Millennium 2, "We've found things to make [Millennium 1] more convenient to work with. We've also speeded the system up," by recoding some Cobol into assembly language.

At the same time, M&D replaced IBM's macro-level CICS supported in Version 1 with the less-efficient command-level CICS in Version 2, because IBM announced it was discontinuing support for the macro level, Fitzpatrick said.

Broke even

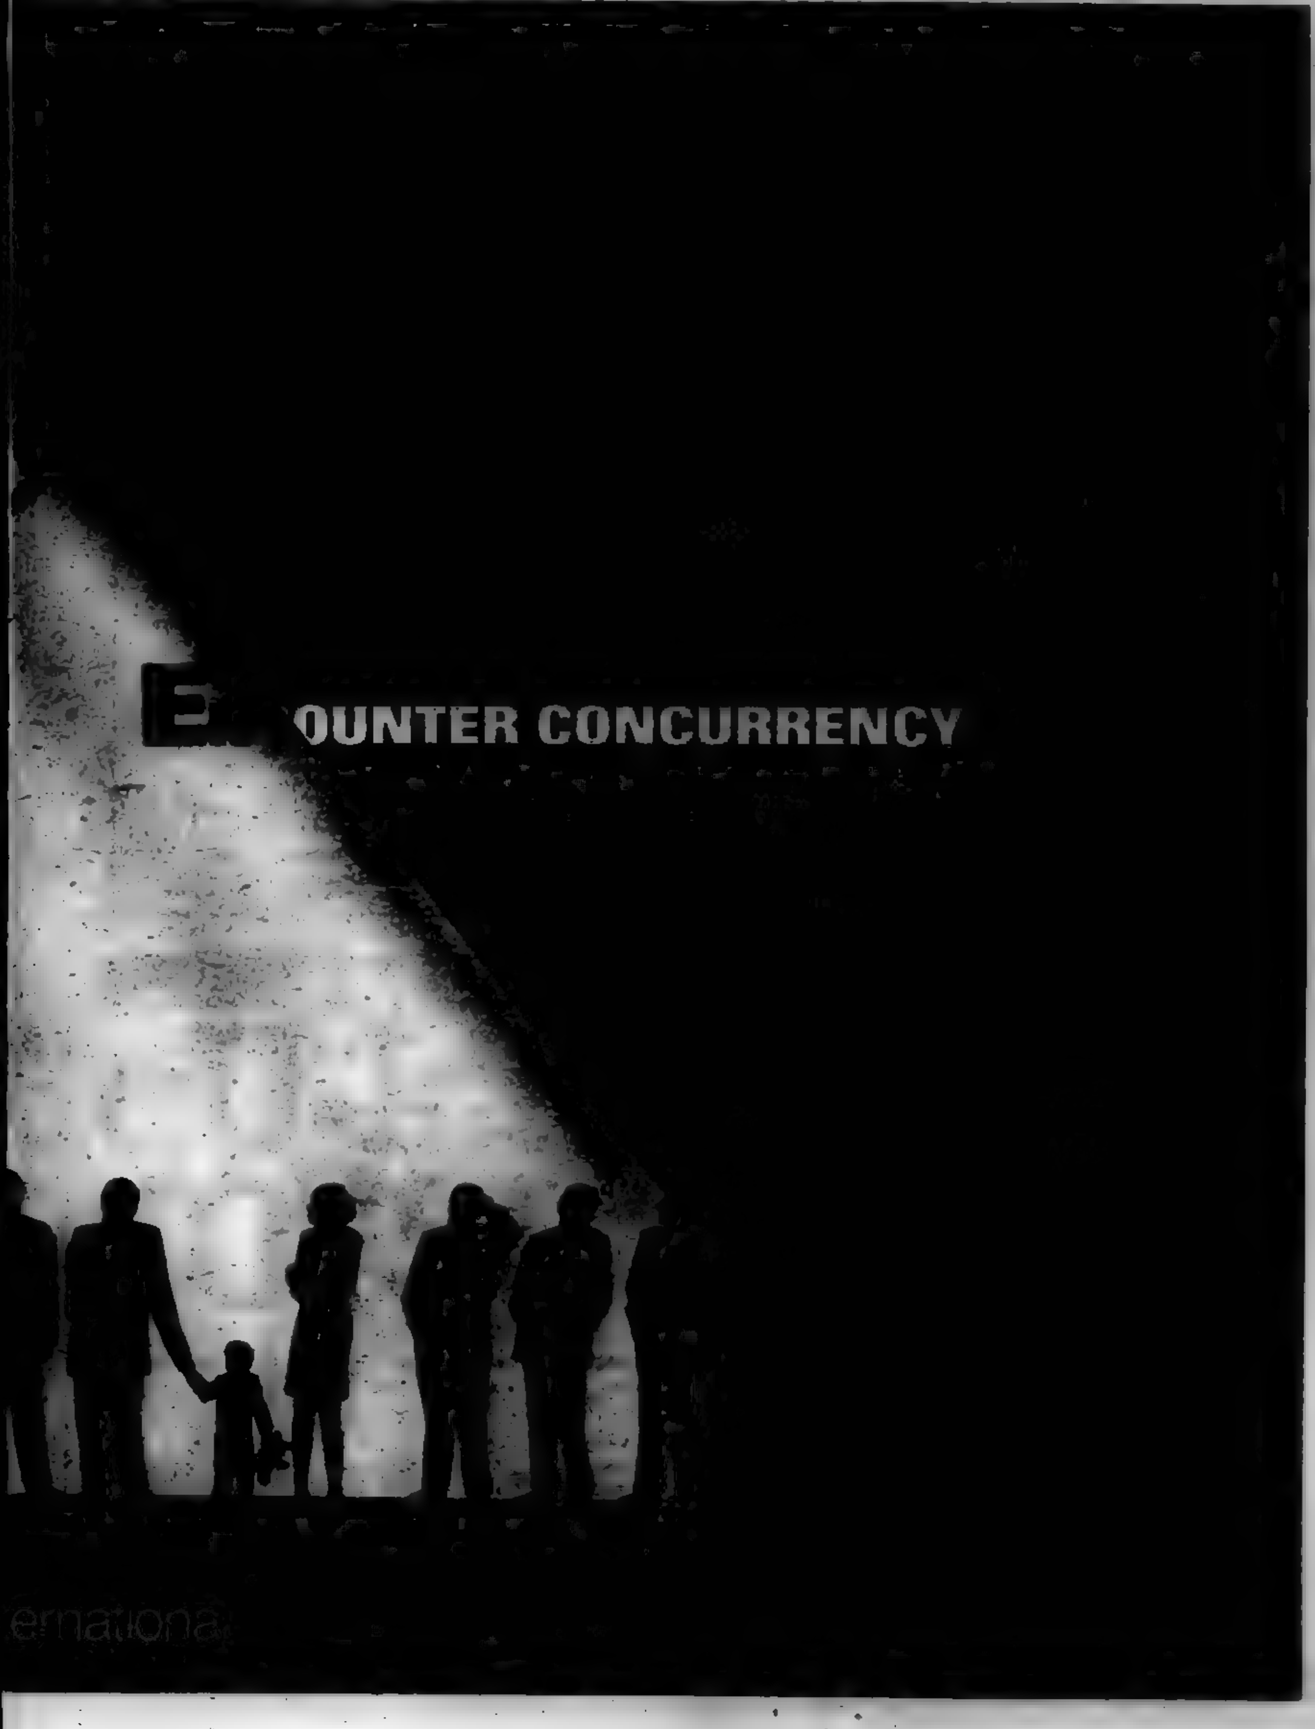
"What we gained in efficiencies we lost in going to command level, so we broke even," he said.

Kelley maintained performance did improve, with estimates that command-level CICS lessened performance 20%, while the recoding improved performance by 30% for a 10% net gain.

The Millennium enhancements will be well received by DP departments, users predicted. Bruce Pergament, vice-president of administration at the Melville, N.Y.-based Pergament Home Centers stores, said Millennium "does take up a lot of space on the mainframe. I know M&D has been deeply concerned about that."

Jerry Smith, senior systems analyst with the Albuquerque Federal Savings and Loan in Albuquerque, N.M., said, "I hear the DP people say that Millennium hogs the machine." But he said the DP people may not appreciate what the software is doing.

Millennium 2 is initially available for IBM CICS and Vsam environments. Version 1 will be supported for another 12 to 18 months, a spokesman said.



CW AT WORLD '85

Ramblings from the floor of World '85:

■ McCormack & Dodge Corp. used advanced presentation technology at its World '85 users conference in Boston last week. Most session leaders were linked directly to the company's mainframes in Natick, Mass.

In a preview of the company's AR:Millennium accounts receivable package, AR:Millennium marketing manager Mickey Clark tapped into a live version of the product to demonstrate how a credit representative would use it. The Personal Computer screens were projected in color onto larger screens. Graphics created with IBM's Storyboard micro software complemented the micro screens. A few session leaders resorted to the trusty overhead projector to convey the latest in software.

■ M&D President Frank Dodge said that the company has spent $2.3 million on equipment in the computer room of its Natick headquarters this year. Among installed products is IBM's DB2. M&D also spent $800,000 to enlarge the computer room. Dodge said his firm, a Dun & Bradstreet Corp. subsidiary, would top the $100 million mark in revenue this year.

■ Robert D. Kelley, M&D vice-president of product strategy, said the company is very interested in developing artificial intelligence applications. "But the AI we provide will be on the mainframe in the Millennium environment," he specified. Kelley said M&D will not program any expert systems in Prolog or Lisp. M&D has considered acquiring an AI software firm but so far has rejected all possibilities, Kelley said.

■ In describing the company's efforts to develop a more rigid systems development life cycle, Kelley said, "We are trying to better manage slippage of availability dates. Whether it will be faster we don't know, but at least we'll be able to predict better."

Development meet set

TOPEKA, Kan. — The 10th annual Data Structured Systems Development Users Conference, Feedback '85, will be held at the Holiday Inn West Holidome here Oct. 8-10.

Speakers for the conference will address object-oriented design and the Ada language, the application of structured requirements definition to knowledge engineering problems and pragmatic successes in data and systems architectural development.

Other topics to be addressed are computer-aided software engineering, using Pacific Bell's system to build data systems, the human aspects of technological society and the characteristics of a framework for information systems architecture.

Prize for info science excellence

Jean-Dominique Warnier will present the third annual Warnier Prize for excellence in the field of information science.

The registration fee is $600 before Sept. 6 and $650 after that date.

More information on Feedback '85 can be obtained from Ken Orr & Associates, Inc. at 1725 Gage Blvd., Topeka, Kan. 66604.

Cbema raps warranty legislation

WASHINGTON, D.C. — The head of the Computer and Business Equipment Manufacturers Association (Cbema) recently lashed out against computer warranty legislation pending in California, Pennsylvania and New York, arguing that it would raise prices.

Vico E. Henriques, Cbema's president, said in a statement that the bills are "unnecessary, heavy-handed and shortsighted."

In general, the bills seek to protect computer buyers from purchasing poor or unsuitable hardware and software. For example, the California bill (A.B. 1507) would require vendors to furnish an implied warranty of fitness for a specified application [CW, July 29].

"Someone who needs a computer for only a year, or someone who wants simply to experiment with the product, could use it free for a year and then claim a vague implied warranty and return it," Henriques said.

Henriques took specific exception to the bills' demands for one-year warranties, which he said would add the cost of a one-year service contract to each computer sold. He called that "an attack on the consumer's right to accept or reject a service contract."

The Cbema chief further argued that computer buyers already have protection, including the Universal Commercial Code, small claims court, the Federal Trade Commission, state consumer-protection officials and the Better Business Bureau.

UNIVERSITY OF MINNESOTA
SCHOOL OF MANAGEMENT
PRESENTS
SYSTEMS ANALYSIS
AND DESIGN

October 20-25, 1985
March 2-7, 1986
Northern Minnesota
Location

Sponsored by:
MIS Research Center and
Executive Development Center

"Systems Analysis and Design" is a chance for companies to develop their talent from within and a chance for professional systems analysts to refresh their skills. These comprehensive seminars take a two-phase approach to systems analysis training.

PHASE A (three days) Systems Analysis and Design

PHASE B (two days) Interpersonal Skills for the Systems Analyst

For Further information contact:
Executive Development Center
324 Management & Economics Bldg.
271 - 19th Ave. So.
Minneapolis, MN 55455

Instructor:
James C. Wetherbe

DP TRAINING

The Chubb Institute has been providing quality DP training for 15 years. Our OS/VS training is skills oriented and learning is reinforced by in-class drills so students are immediately productive at the end of each course.

Registration Code	Course	Dates	
TCWA	TSO/ISPF	Oct 21-23	NJ
JCWA	Job Control Language	Oct 7-9	NYC
VCWA	VSAM in COBOL	Oct 28-30	NJ
BCWA	Assembler	Oct 7-10	NJ
CCWA	CICS(Command Level)	Oct 7-11	NJ
NCWA	Data Processing for the Non-DP Manager	Sept 25-27	NJ

In addition to these courses, our applications training curriculum includes ANS COBOL, Assembler Language, VSAM in COBOL, and CICS Command Level Coding.

The PC curriculum provides separate training for DP professionals and the general business audience.

10% discount for three or more attendees in the same course.

WIZARDMAP™...
a programmer's dream!
the affordable automatic map generator

A complete online utility which automatically generates BMS code with standard desired attributes from a free form screen layout. After the BMS code is automatically generated, you can, if you wish, easily change the BMS code to fit your specifications. WIZARD MAP™ automatically catalogues the coding to the source statement library. The program can then do the final map assembly. The introduction of WIZARD MAP™ is for DOS, OS, MVS. Cost [illegible]

- Easy to use
- Ends the boring writing of BMS code
- Saves hours on each application in coding requirement
- Improves maintainability
- Perfect tool for untrained personnel to create map designs
- No need to learn BMS
- Immediate return on investment
- Insures consistency
- Experienced programmers have more time to be creative

Why the three letters you think of first for System/38 add-in memory shouldn't be IBM.™

EMC introduces its 1MB memory expansion card for the System/38.

EMC has just added a feature to add-in memory for IBM's System/38 that's been sorely lacking.

Competition.

Like IBM's 1 Megabyte add-in memory, our new memory expansion card lets you boost the speed and performance of your System/38. Without increasing software or other hardware costs.

But unlike IBM, we let you do it for $2,000 less. (IBM's price is $7,500, ours is just $5,500.)

And our new 1 Megabyte memory uses newer, more reliable technology. It's so reliable, there are *no maintenance charges* of any kind.

IBM, on the other hand, charges you a memory maintenance *fee* of more than $1,000 a year. Every year.

Our memory comes with the industry's only unconditional warranty.

EMC is the first company to ever offer you an *unconditional lifetime* warranty on a System/38 memory card. And we offer the same warranty on every other memory card we make.

[illegible] special toll-free hotline and we'll send you a new card *within 24 hours*—absolutely free.

And our new memory expansion card is *100% plug compatible* with the System/38. So it supports all IBM memory and memory diagnostic features. Installation takes just 10 to 15 minutes (you can even do it yourself) and does not affect your IBM maintenance coverage in any way.

We're the name DEC,™ HP, Prime™ and Wang™ users remember first.

EMC is the only independent supplier of memory expansion cards for the System/38.

As well as the world's largest manufacturer of add-in memory for minicomputers. Including Wang, DEC, HP and Prime.

Among our customers are AT&T, Merrill Lynch, Ford, Bank of America, General Mills, EXXON, 3M and many other Fortune 500 companies.

But you can't appreciate all that an EMC memory board can do for *your* System/38 by reading an ad.

You've got to use it.

To let you do that *before* you buy, we've come up with a special trial offer for qualified System/38 owners. Just call or write EMC Corporation at 12 Mercer Road, Natick, MA 01760—and we'll install a "no maintenance" EMC memory board for you without cost or obligation.

Then you can evaluate it for *two full* weeks on your own system, running your own applications.

Once you do, remembering our name will be a snap.

For your free two-week evaluation, call today:

1-800-222-EMC2

(In Massachusetts, call 617-655-6600)

EMC²

No one is more committed to memory.

IBM is a registered trademark of International Business Machines.

NEWS

WORLD DIGEST
CW International
News Network

CANBERRA, Australia — An angry row has broken out over allegations that corruption involving an Australian Customs Service computer is allowing criminals to enter and leave Australia undetected. The charges have been made by the Australian Federal Police Association, which has demanded an immediate government inquiry into information that downtime on the Customs Service computer coincided with the arrival and departure of some 60 criminal suspects during the last 12 weeks. The Federal Police, however, deny there is any such problem, while publicly admitting that the system sometimes suffers from the "hiccups."

MELBOURNE, Australia — The First Pan Pacific Computer Conference will be held here Sept. 10-13. Show sponsors at the Australian Computer Society and the International Federation of Information Processing expect more than 150 vendors at the conference, whose theme is "Software — The Driver." Some 126 technical sessions will be offered.

STOCKHOLM — The president of one of Sweden's largest software houses has called for government aid in developing and distributing software. "The Swedish state should help with the development costs through subsidization," said Magnus Larsson, president of a software company called Expander.

STOCKHOLM — The Swedish committee on copyright protection is preparing a report that is expected to advocate extending copyright coverage to computer software and semiconductors. The government will make the final decision concerning adoption of the committee's recommendations.

SINGAPORE — A joint venture set up here by Burroughs Corp. and Detroit-based Yojna, Inc. will be the first software company here to be granted a five-year tax holiday under a government incentive plan called Intec, established by the country's National Computer Board. The company, called Burroughs Cyberware Ltd., will conduct applied research and development into two existing product families — Global and Local-Area Communications Executive and Prototyping Environment Utility System — which Yojna has been developing for some years in Detroit.

MUNICH — The German Postal Telegraph and Telephone (PTT) authority has approved a test run of a voice/mail system, scheduled for April 1986. The voice/mail system would enable transmission of time-delayed messages from computer workstations. Three companies won contracts for the equipment involved in the project: Siemens AG, Standard Elektrik Lorenz AG and German Telephone Works and Cable Industry AG.

CANBERRA, Australia — The federal department responsible for providing policy advice on uranium-related and nuclear issues has publicly admitted that its computer system is vulnerable to sabotage by antinuclear extremists and that it has no formal backup plan. A strategic plan published by the Resource and Energy Department said that complete loss of this system due to sabotage is possible.

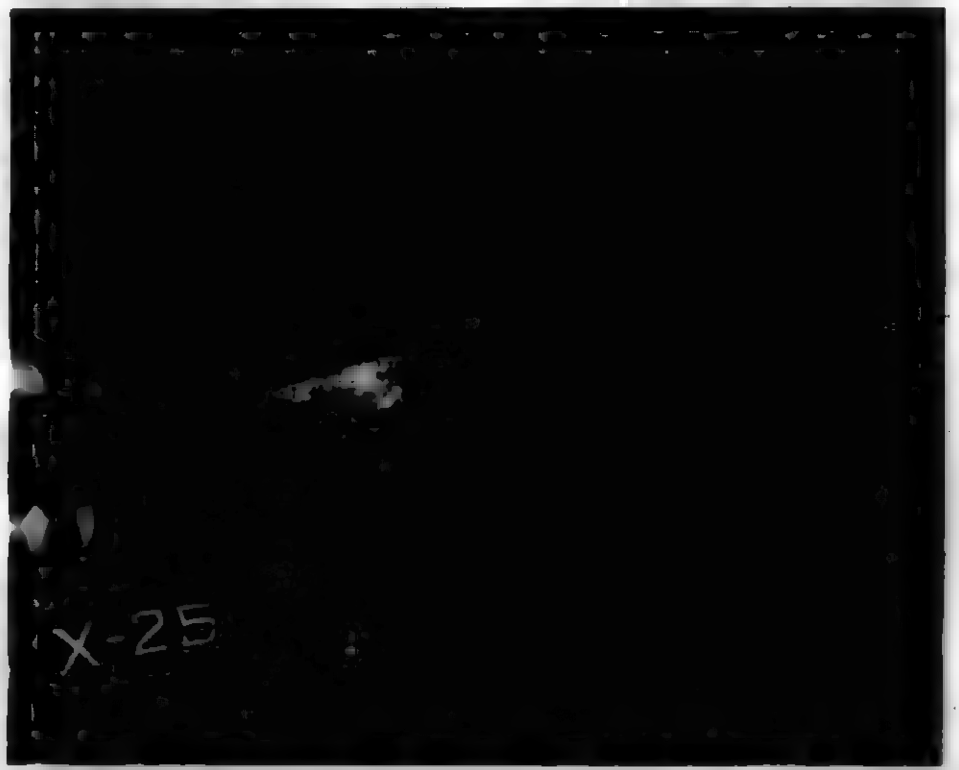
The department relies for emergency backup on Prime Computer, Inc., its computer supplier, and other government departments. Furthermore, the department felt that having two identical versions of its Prime minicomputer — both on the same site — served as partial backup.

COLOGNE, West Germany — Profits jumped 42% for fiscal year 1984 at Honeywell Bull AG. The German subsidiary of the French Groupe Bull earned $7.2 million, up from $5 million in 1983. The company predicted continued growth for 1985. Revenue for 1984 increased 10% to $138 million. Large systems accounted for an additional 29% of this revenue, while minicomputers, workstations and terminals amounted to 20%.

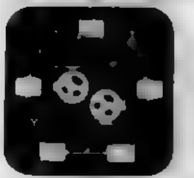
SYDNEY, Australia — Wicat Systems of Australia is claiming some of the credit for Wicat Systems, Inc.'s return to profitability during the June quarter. The U.S. parent company reached $110,000 in profits on $9.7 million revenue in that quarter, the first time it has made a profit since becoming a public organization two years ago. A spokeswoman here explained that the Pick operating system, ported to Wicat hardware by the Australian company in 1983, had been selling well since its U.S. release in March.

MUNICH — In a race to grab future customers, Siemens AG and AT&T have been crisscrossing the Atlantic recently to expand their businesses on each other's home turf. Siemens has created facilities in Boca Raton, Fla., while AT&T has launched Microelectronics GmbH here in Munich with a former Siemens executive at the helm. Seimens already has some 15,000 people at work in Boca Raton's Seimens Communications Co. Both companies are expected to concentrate on the telecommunications and office automation markets.

The LAN's IBM Mainframe Connection



Auscom High-Speed Interfaces to The IBM Channel



Auscom, the recognized leader in IBM mainframe channel interfacing, provides the capability of attaching the LAN of your choice directly to any IBM or Plug-Compatible mainframe. This allows you to access the host at your LAN technology speed instead of settling for slow-speed serial connections. Auscom offers a variety of field-tested solutions to meet your network-to-host requirements, including end-user interface units and board-level products for integration into OEM networking systems.

With the Auscom solution, no changes to the host operating system are required. Our channel interfaces appear as standard control units to your mainframe. Standard access methods are used for transfer of data to and from your mainframe at rates of up to 2 megabytes per second. Networking protocols can be run in the host, the Auscom interface or the LAN controller. We maintain an extensive software library to support our unit which provides support for such protocols as XNS, TCP/IP and optimized high-speed packages.

Our interface unit can simultaneously emulate multiple controllers and support different protocols, providing maximum flexibility in meeting your local and remote networking requirements.

For example, by installing both a LAN controller and a packet-switching interface in a single unit, you can link the host to both local and telecommunications networks. If support for your network is not currently available, the full programmability of our interfaces allow integration by either Auscom or your own programming staff.

For further details concerning solutions to your IBM mainframe networking needs, contact AUSCOM— Number One in field-tested, proven high-performance channel interfaces!

TURNAROUND TIME

Larry Long

***Q** I am responding to a letter in your column in which a disgruntled person was complaining about the treatment received from a headhunter. The complaint arose from the agent's lack of respect for the candidate's wish that the agent not contact a certain firm.*

It is unforgivable for any agent to disregard the wishes of the candidate he represents. A candidate should never work with an agent who will not respect a legitimate request. Tell the agent what you expect, and send the agent the demand in writing. If the agent does not acquiesce to this demand, turn him in to the governing state agency.

In the many years we have been placing computer professionals, we have never sent a resume until we first get in touch with our candidate and determine that we have a mutual agreement that the position is suitable. Technically, the resume belongs to the candidate, and we treat it as such.

Please inform your readers to demand that their agents inform them prior to sending any resumes and that they work as a team. If an agent will not agree to these terms, dump him.

It is unforgivable for many professionals — lawyers, computer specialists and a host of others — to do what they do, but they do it anyway. They will continue to do it as long as we let them get away with it.

I invite any readers who feel they have been treated in an unethical manner by a search firm to let it be known. Let's see what can be done to eradicate the unethical elements in this business.

***Q** I am a [U.S.] citizen, reside in Europe and work at the computer technician level for a U.S. multinational company on an expatriate basis. I have made a decision to leave my company but wish to remain in Europe. Could you advise me how to find other U.S. companies and interest them in offering me a job on expatriate terms?*

I wish I could be more encouraging, but you may have better luck if you seek employment with a European firm.

Virtually all multinational companies operating in developed countries prefer hiring foreign nationals at the operational levels.

Most European assignments are awarded to middle and upper management personnel whose future positions in the U.S. will require some international exposure.

Your best bet may be to conduct your search in Europe, just as you would conduct a similar search if you were in the U.S.

***Q** My husband is currently a systems manager at our company's headquarters. I work as an administrative assistant in the personnel department. My husband was recently offered a promotion, with a 50% increase in salary, but we would have to move to a regional office in the Midwest.*

Under normal circumstances, the company would be willing to transfer me as well, but since my husband will have authority over all departments that would hire secretaries and administrative people, they said that I would not be able to transfer to that office.

My husband wants to go, but I'm having second thoughts. If they can transfer other husband and wife teams, why not us?

Most companies will not permit a situation where one spouse can in any way influence the performance evaluation of the other. It may be a while before opportunity knocks a second time for your husband. If he turns down this position because you will not be retained, company executives will consider his decision to be poor judgment and will be reluctant to offer such a promotion in the future.

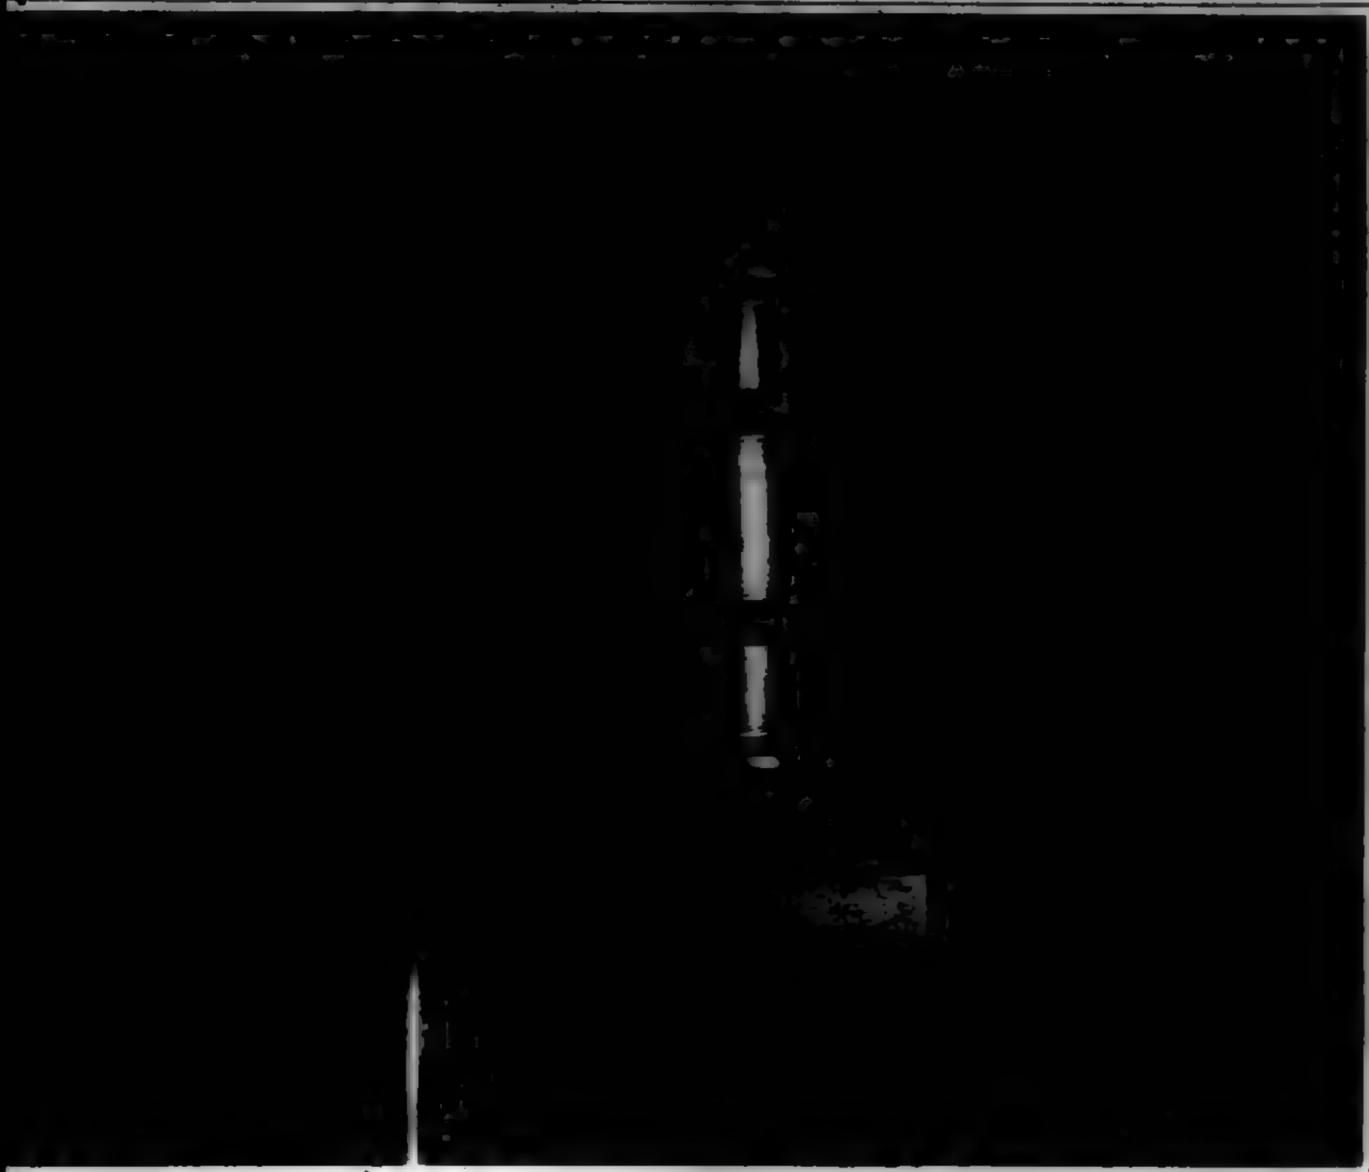
OCTOBER 3-4, ST. LOUIS — **Federal ADP and Telecommunications Procurement.** Contact: International Data Corp., Washington Division, Suite 240, 1500 Planning Research Drive, McLean, Va. 22102. Also being held Oct. 17-18 in Denver.



word for it. Ask us to demonstrate it for you.

And while you're at it, let us bring you up to speed on our performance.

Our Communications Servers transfer over 200 packets a second. Our Gateway Servers do over 350 packets a second.

Your wish is our command.

Our user interface works just the way you'd expect it to work.

It's easy, logical, complete.

It's simple to change parameters, display statistics, execute command macros, broadcast messages anywhere on your network. Anytime.

And if you ever get into trouble, a single keystroke gets you "Help." Over a hundred commands will come to your rescue.

If you're looking for one network that can handle virtually every connection in your plans, call us at 415-969-4400. Or write Bridge Communications, 1345 Shorebird Way, Mountain View, CA 94043.

We'll show you how to keep all the equipment in your office on tap.

EDITORIAL

Hands off

The legislative busybodies are poking around computers again. Having raised alarms at such prospects as renegade hackers tapping sensitive data bases and foreign snoops using directional antennae to snatch unprotected data from terminal screens, the when-in-doubt-legislate boys are turning their attention to electronic bulletin boards. Their activities deserve keen attention and must be headed off lest the free flow of electronic information winds up outside the purview of basic First Amendment protection.

Bulletin boards are one of the most unique and fascinating phenomena of the microcomputer revolution, frequently providing useful new technical and application data to serious computer users. Alas, they are also used for considerably less noble purposes. Some broadcast obscene messages, others list purloined computer passwords and network access codes. Indeed, computer security experts estimate that there are at least 1,000 underground bulletin boards that traffic exclusively in illegal topics.

People *do* abuse freedoms. Always have, always will. They do it in newspapers, they do it on highways. Typically, those people are in the distinct minority and are best ignored unless and until they do serious injury to others.

Electronic bulletin boards, however, are not being ignored. *Computerworld*'s Washington, D.C., bureau has recently looked into this story and uncovered some unsettling developments.

At the federal level, Sen. Paul S. Trible Jr. (R.-Va.) recently introduced a bill (S. 1306) banning pornographic messages from computer bulletin boards. In particular, Trible wants to close down "sex talk" computer services and networks run by alleged child molesters who share information about their victims.

At the state level, California is leading the way. A bill introduced by Sen. John Doolittle (R-Calif.) would make it illegal for anyone to place a password, access code or financial account number on a computer bulletin board without authorization. It would also make the system operator liable for permitting the information to remain on the bulletin board after being notified that it was unauthorized.

These represent misguided attempts to harness change by putting it into a legislative straitjacket. Electronic bulletin boards — like newspapers and books — should have First Amendment protection. They are a legitimate medium for transmitting essential information that should have First Amendment protection. Efforts to regulate this form of electronic publishing could have a chilling effect on free speech, especially in its effect of prompting operators to censor their bulletin board offerings out of fear of legal prosecution.

A far better overall approach is the one taken by the computer crime committee of the Data Processing Management Association (DPMA) in its model computer crime bill. This proposal urges aggressive pursuit of those who use bulletin boards to engage in illegal activities and proposes to outlaw "aiding, abetting, conspiracy and/or solicitation of a computer crime," such as by posting a computer password or network access code on an electronic bulletin board.

The DPMA approach seems, by far, the most reasonable solution to an admittedly awkward problem. The label of illegality must never be applied to information in a free society. That is too easy and too dangerous a step to take, even when confronted with the threat of personal computers, modems and telephones in the hands of miscreants.

NOW THAT THEY'VE WORKED IT ALL OUT...
OBVIOUSLY THEY'RE GONNA NEED OUR HELP!
THE "BIG BOYS"
AI SMALL COMPANY INNOVATORS

LETTERS

Users responsible for Unix survival

In the article, "AT&T's Unix: the formula for revolution?" [CW, July 8], few people view Unix as a replacement for MVS or anything else. Rarely do information systems replace something else. They migrate or coexist, depending on the type of processing.

Second, the statement in the article saying that manufacturers' "hardware would become a commodity" is one of the major reasons why Unix will survive. The other reason is also commodity-driven: well over half of today's computer science graduates are trained in C and wouldn't dream of working in traditional programming languages.

The Unix market is no different than any other save for two critical factors — users do not have to be manufacturer-dependent, and the already low supply of computer science graduates who are Unix-trained.

For once, the users may be in the driver's seat.

Paula J. Brooks

VIEWPOINT

The future of mid-range systems

LECHT ON SCIENCE
Charles P. Lecht

In my last column, I suggested that there are still opportunities for small systems, especially if planners focus on creating easy-to-use, special-purpose tools rather than on general-purpose systems needing laborious applications programming. At a time when sales are sagging and manufacturers are failing, this may have seemed the witless remark of an unbridled optimist.

My latest prognostication may be every bit as hard to accept: Despite recent reports of dwindling profits in companies that manufacture mid-range systems, I forecast that this will change because of reasons similar to those I cited when discussing the small systems picture.

I never denied that small systems as we have conceived of them must face diminishing sales. I based my optimism on the fact that the technology influencing small systems product offerings is undergoing rapid change; the result is a new class of products that do less but do it with less fuss. I concluded that because of this, more people than ever before would purchase the powers such small systems provide.

So what about the future of mid-range systems? First, my definitions: A small system is one that can't do too much, or if it can, it can't do it too fast. A mid-range system — sometimes called a medium system — is one whose processing powers exceed those of small systems and are less than those that can be obtained in others of the same genre.

Until recently, medium systems technology was consigned, for the most part, to the role of providing bigger versions of small general-purpose computer systems — but not the biggest that could be had. In the good old days, the 1950s and '60s, no one could have misunderstood what bigger meant. Then, small, medium and large systems were defined by size considerations of a highly conventional nature.

In these times, defining a system as big or small is risky business; all kinds of conditional complexities have entered the picture. Nonetheless, if you accept the idea that mid-range systems exist, whatever criteria you use to identify them, I can argue that these offer the greatest potential in the data processing systems area.

Mid-range systems will see a vast improvement in sales when very basic premises that influenced past design are removed. Thus I suggest that designers who overcome their compulsion to view these as nothing more than bigger versions of small systems will likewise see vast improvements in the sale of their products. The reason: two recent events that have forever changed our DP world.

The first, distributed systems technology, was born within the computer industry as systems designers realized that the miles of cabling inside their computer inventions could be uncoiled. When the cabling was uncoiled, it allowed a system to be distributed over increasing areas and ultimately to be linked to other systems by preexisting, in-place networks of communications companies.

The second was the inevitable synthesis of the computer and communications industries as the latter continually increased the intelligence — a euphemism for computer technology — in their networks. Both events created the impetus for Integrated Services Digital Networks (ISDN) — small to large and everything in between.

From here on, the ISDN are the new family of general-purpose computer systems. The heretofore discrete but general-purpose systems technologies — desktop, small, mini, midi (mid-range), maxi and super will become ever more specialized. And it's my guess that the mid-range will, by dollar volume, exceed all others in its command of our collective data processing hardware expenditures.

Within the framework of the ISDN, these systems will play the vital role of mediation once found within the cabinet of a single CPU but now distributed all over the place. This includes the roles of net and device controllers, file servers, data base machines, concentrators, nodal processors, convertors, switching subsystems and so on.

By tending to flocks of terminal devices while servicing the needs of massive supercomputers as I/O data staging devices, the mid-range computer is destined to be the workhorse of the ISDN, whatever its size.

The new role of these systems is in some ways confounding to people inside and outside the computer industry. Having been bombarded with notices of astonishing change in small and large systems technologies, many seem to have concluded that there is no role for the mid-range in the scheme of things; therefore, it is on its way to becoming extinct.

Some seem to have adopted the belief that only bipolar data processing environments — massive machines servicing very small terminals — are in our future. I vigorously dispute this; there is no precedent for the bipolar theory. Even in telephone systems technology, local exchanges, or mid-range in this context, far exceeded in number the larger systems to which they were attached and, in dollar value, these and the sea of telephones that they served.

The role of mid-range systems technology is brighter than ever. We'll not be able to scale the ladder of data processing possibilities, bottom to top, with its middle rungs missing.

Lecht is chairman of Lecht Sciences, Inc., a New York-based think tank specializing in computer and communications technologies.

Microcomputer support: headache or gold mine?

MANAGEMENT MATRIX
Walter F. Cuirle

Microcomputers have been around for only about eight years as a consumer item. As an affliction in the day-to-day life of the MIS manager, they have an even shorter tenure — about five years. A great deal has happened in that time: vendors and services that seem to have been around forever but haven't, companies that seemed as if they would last forever and didn't.

MIS managers reacted in a variety of ways while all of this was going on. A few pulled the wagons in a circle and tried to fight off the onslaught. They were buried with their punch cards. Others disdained the new toys, retreated to their raised-floor temples and held fast to the attitude of the good old days when the data processing world was divided into the Initiates and the Rabble. The Rabble went on without them.

Nowadays, what seems to have evolved in most companies is an understanding that corporate MIS will handle corporate affairs and leave the various departments or divisions to make their own individual decisions on whether to implement microcomputers and how to do it. It's as if the MIS motto has become, "If it doesn't talk to the mainframe, don't talk to us."

That's a shame. The whole industry still has the fervor of a gold rush. And in a gold rush, it is not the miners who make the fortunes but the folks who sell support.

Take a look at the vendors of the popular microcomputer applications packages. They manufacture the pickaxes, lanterns and shovels in this gold rush. They would love it if their job was done when the package was delivered. Unfortunately, that's not the case — that new buyer may not be comfortable with the machine, is usually in a big hurry and probably didn't read the manual. So the vendor gets a telephone call. And then another. As the program's popularity grows, there are more and more calls.

Many vendors have been offering free support up until now, but that is likely to change. Aside from sheer volume, consider the problems that vendors have in handling customer support. Many calls describe problems having little or nothing to do with the applications package itself. For example, the caller may simply not understand subdirectories.

In cases where the problem does have to do with the package, the answer is often in the manual. In those cases where calls are free, there are inevitably users that overdo it and call about every little thing.

More sophisticated callers may have more interesting questions, but those calls may have to do with some arcane aspect of the caller's business that is unknown to the vendor's technical representative. The better the sales, the more calls there will be, but, because support represents a loss of revenue to the vendor, staffing is apt to lag demand. The result is a long queue of impatient customers.

No wonder vendors want to start charging for their trouble. Different fee structures are being considered. So far, there have been proposals for charges by the minute or by the call as well as for a yearly support contract. There will undoubtedly be other ideas. This is where corporate MIS comes in. If your financial organization allows it, there could be chargeback gold in them thar phone calls.

What can you offer that the vendor can't? Familiarity, for starters. Look at your experience in supporting users of your systems. The vendor's technical representative has to handle any kind of configuration that comes down the road and will necessarily have to start the call by getting basic information. Your organization has the advantage of knowing, or at least being able to find out, exactly who has what. As a result, you can be prepared to handle questions more effectively.

Unlike a vendor's ever-increasing volume, your novice users are likely to come in blocks — 20 this month as one department buys, 30 next month as another buys. You should be able to find out from the various departments what packages are being considered and when a decision will be made. In short, you have a more predictable user base; that potentially means better planning, closer margins and lower overhead.

Finally, you can probably offer single-source support, one call for any problem. Your own support people are already experienced in dealing with these users and their quirks. Because they now support the in-house systems, they also know what is available there.

Naturally, there is a lot of preparation to be done before you can make this idea work, but take a hard look at the situation. Suppose one of your own corporate departments is looking for a telephone support contract for its microcomputer users. Who really has the most to offer? Your own support group or a potpourri of vendor reps? Answer the telephone — that's opportunity calling.

Direct PC to System 34/36/38 Connections Using Standard Twinax Cable

It's Easy With AST-5251/11™: Fast Hookup, File Transfer, Advanced Features & Reliable Operation.

Standard Twinax Cable Support Makes Installation A Snap. It's simple to use your PC just like a standard IBM® 5251/11 terminal—just plug our AST-5251/11 emulation board into your PC/AT/XT, portable or compatible, and connect the standard twinax cable to your IBM System 34/36/38. Over one million AST PC enhancement products are installed worldwide with over 20,000 PC to System 3X connections to date.

File Transfer Is Only The Beginning. With AST-5251/11 you use your PC as always, while concurrently emulating a features-enhanced Model 11 terminal with the ability to transfer files bi-directionally between your host and PC.

Use Your Favorite PC Software. AST's file transfer support not only eliminates the burden and the errors of re-keying, it adds the ability to manipulate transferred data using your favorite PC software packages, like Lotus® 1-2-3™ and WordStar.® And our Hot-Key support lets you conduct concurrent DOS and host sessions, while our applications program interface (API) makes integrating PC and host applications simple.

Even Greater Efficiency. AST-5251/11 also provides host-addressable 5256 printer emulation for your PC printer in a background operational mode.

A Family of Solutions For Your Smart Office. Whether you need AST-5251/11 direct connections, or AST-5250/Display™ full IBM 5251 Model 11 display attributes, Hercules™ graphics compatibility and IBM PC standard monochrome adaptor compatibility, or AST-5251/12™ remote PC to System 34/36/38 connections, all AST micro-to-mini data communications products are strategically focused and developed to support and evolve in concert with the IBM Smart Office architecture. You can count on AST's connections—today and in the future.

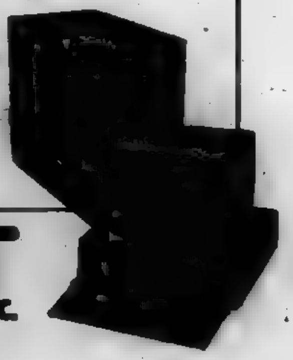
See your dealer, or call our Customer Information Center (714) 863-1333 for more information. AST Research, Inc., 2121 Alton Avenue, Irvine, CA 92714 (714) 863-1333 TWX: 753699ASTR UR.

Fusion registered trademark of Fusion Products International. DecisionLink trademark of Laguna Laboratories, Inc. The BOSS registered trademark of TenMan Systems, Inc.

KEY FEATURES
- Plugs into PC/XT/AT and compatibles; connects to System 34/36/38 via twinax cable and supports cable thru.
- Emulates 5251-11, 5291, or 5292-1 display terminal.
- Provides host-addressable 5256 printer support (background mode) on PC-attached printer.
- Selectable DMA and I/O interrupt channels.
- Application program interface (API) and bidirectional file transfer included.
- Complete package includes hardware, software, twinax cable assembly, and comprehensive user manuals.
- Supports fixed or hard disk.
- Hot-Key assist for concurrent host and PC sessions.

OUTSTANDING FEATURES
- IBM FSU compatibility (for virtual disk support on the System 34/36/38).
- Third Party Software support, including ASTLink by Fusion,® Laguna Laboratories' DecisionLink™ and The BOSS® by TenMan Systems.
- AST-5250/Display.
  - One card solution for standard PC, IBM 5251/11 and bit-mapped monochrome graphics display.
  - Used with AST-5251/11 brings full IBM 5251 Model 11 display attributes to your monochrome display.
  - Includes Hercules compatible high-res bit-mapped graphics capability and parallel port.
  - Automatically switches from 5251/11 display to PC display without operator interaction.

AST RESEARCH INC.



Hardware Roundup

By Donna Raimondi CW Staff

A look at 32 systems from 19 vendors

When Seymour Cray unveiled his Cray-1 supercomputer in 1976, many scoffed at its $7 million price tag, claiming that only a select few would ever be able to afford such an outrageous machine. Scientific computing was thought to be a profession reserved for ivory tower researchers and top secret government think tanks.

The times have changed. In the past three years, scientific — number-crunching-oriented — computing has found its way into many commercial DP shops.

A voracious demand for simulations and modeling, particularly among companies involved in designing highly technical products, has made scientific-oriented processors a staple.

Furthermore, the emerging artificial intelligence genre of applications is opening up marketplaces for parallel processing systems — series of CPUs that can either work on several problems at once or divide one big problem into several smaller parts for more efficient processing.

Users still balk at price

Users clearly still balk at the multimillion-dollar price tag of supercomputers, but more of the highly specialized systems are turning up in what are generally regarded as commercial applications.

Oil exploration firms are using the machines to analyze satellite data; auto manufacturers are using supercomputers to simulate auto crash tests; and the movie industry has discovered supercomputers as an ideal tool to produce highly sophisticated graphics.

Recent high-end mainframe announcements from IBM, Burroughs Corp. and Honeywell, Inc. — all of which have prices pushing the $10 million mark — have softened the sticker shock of supercomputers for some users. But for the many who still cannot justify or who cannot afford a supercomputer, a new niche market has developed.

Systems at a fraction of the speed, price

In recent months, there has been a rash of smaller, scientific-oriented computer systems announced that offer processing capabilities similar to supercomputers but at a fraction of the speed and price.

This week's Hardware Roundup focuses on an admittedly mixed bag of systems. For the first time, supercomputers have been added. The second part of this week's installment is devoted to superminicomputers that appear to have either a scientific bent or that appeal to a specialized audience.

It is in this second group where the distinctions among processor types can become sticky. For example, most vendors in this group claim their systems can be used for both scientific and commercial applications. Vendors of parallel processors, for example, would argue their systems are not so much special purpose but built with special architectures.

Computerworld agrees that the groupings as laid out are not perfect but are designed only to present the systems in some kind of order. The categorizations are not meant to be a buyer's guide but only to enable readers to look at similar systems all in one place.

> ”
>
> *Scientific — number-crunching-oriented — computing has found its way into commercial DP shops. A demand for simulations and modeling has made scientific-oriented processors a staple.*

Four basic types of superminis

Included in this group are four basic types of superminicomputers: scientific oriented, machines with parallel architectures, transaction processing systems and reduced instruction set computer CPUs.

Supercomputers can be defined as machines that have efficient and fast vector processing, usually (but not always) using 64-bit precision. The million floating-point operations per second (Mflops) measurement that sets supercomputers apart from mainframes could arbitrarily be set at the 160 to 200 Mflops range. That definition, however, does not cover machines like Denelcor, Inc.'s Heterogeneous Element Processor, which is a scalar parallel processor that is less powerful than a traditional supercomputer but is significantly more powerful than the average parallel processor.

The past year has produced a crop of new supercomputers.

Cray Research, Inc. introduced its Cray-2, said to be 12 times faster than the Cray-1 machine. Amdahl Corp. unleashed both a low-end model, the 500, and its top-of-the-line 1400 model in one announcement.

Parallel processors

A number of parallel processing machines — including offerings from Encore Computer Corp. and Alliant Computer Systems Corp. — theoretically offer supercomputing power in their largest configurations.

Parallel processors may well be the fastest growing segment of the computer industry. They are used primarily for scientific purposes, as they make excellent number crunchers. Some manufacturers claim that they will be suitable for all kinds of applications once software is available to take advantage of their parallelism.

To that end, researchers are trying to work out methods of unleashing the inherent power in the systems.

Intel Corp., for example, has distributed a number of its ISPC concurrent processors to universities and supercomputer research agencies that will explore applications and algorithms in concurrent processing.

Fault-tolerant transaction processing systems include those manufactured by Tandem Computers, Inc., Stratus Computer, Inc. and Sequoia, Inc.

The past year has been a rough one for the transaction processing vendors. Auragen, Inc. and Synapse, Inc. both fell upon economic hard times. IBM got into the transaction processing act with its System/88, basically a renamed version of the Stratus/32 (hence not included in the Hardware Roundup). Other vendors, such as NCR Corp. and Digital Equipment Corp., also appear to be testing the fault-tolerant waters by developing methodologies for linking current systems in a fault-tolerant configuration.

Reduced instruction set computers — including Ridge Computers and Pyramid Technology Corp. machines — attempt to produce a more efficient system's architecture by streamlining the system instruction set in such a way that most internal operations can be carried out within one machine cycle. The architecture appears to have a bright future but may have some early limitations because of compatibility problems with existing systems using more cumbersome instruction sets.

With over 100,000 boards already in place, few would argue that IRMA™ has become the standard in micro-to-mainframe communication links in the 3270 environment.

Especially since IRMA's grown into a family of compatible hardware and software products.

Now IRMA's family is about to grow once again. Introducing IRMAlink/Windows™.

IRMAlink/Windows is an inexpensive and easy-to-use software product that gives the PC user the ability to display a single host session and a PC session on the screen at the very same

Now IRMA even does windows.

time. No flipping back and forth between the PC and the host sessions.

With DCA's host-based software speed you'll be able to transfer files from the mainframe in background mode while working in PC mode. Which will help you increase your productivity.

Find out more about IRMAlink/Windows.

Bus Architecture	Yes

ONLY A NETWORK THIS MANAGEABLE

Are you in control of your data network? Or a slave to it? Locked into hardware that limits your options? Overburdened by maintenance? And trapped by multiple systems you can't manage?

The Information Systems Network from AT&T lets you take command. It's the only data network that allows you to integrate and manage your terminals, workstations, PCs, minis and mainframes as a single corporate-wide data network. It's the only network you can completely control.

You've got the whole network in your hands.

ISN's hierarchical star topology centralizes system administration and maintenance. The hub of the system is a fast-switching Packet Controller. It's linked to all data devices and manages all network functions. So, if one device goes down, the Packet Controller keeps your network up and running.

A System Control Console taps right into the Packet Controller. From this terminal, you can manage the network using simple English commands. You can add or move equipment, monitor network performance, track down faults and take corrective action—without disrupting network operations.

With a special password, you can perform maintenance functions from any asynchronous terminal in the system. And you have the option of remote maintenance from one of our service centers. ISN gives you multiple points of control.

You've got plenty of flexibility.

ISN links the devices in your network with twisted copper wire and fiber optics. It uses our Premises Distribution System wiring scheme which allows easy modular growth.

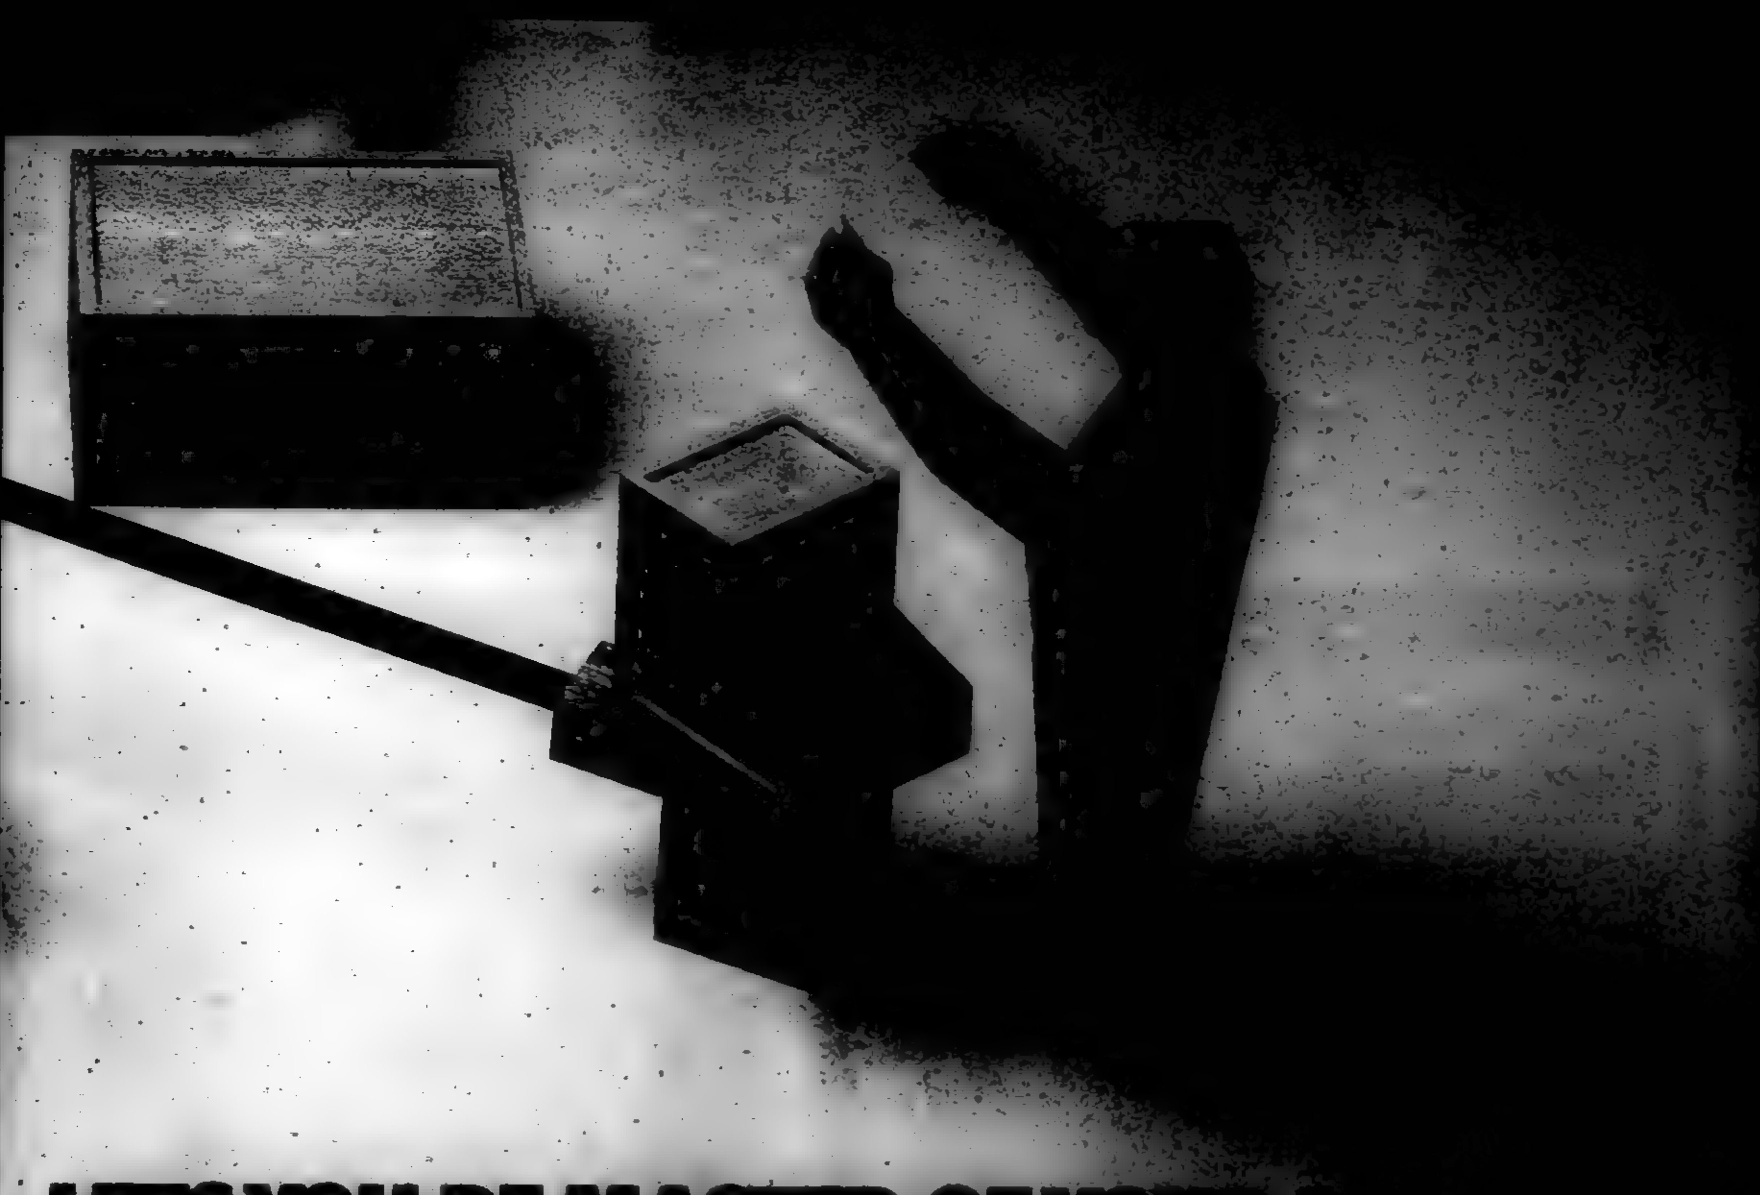
ISN is flexible and open to change. Start with as few as 50 devices and let it grow. ISN's open architecture allows you to easily add on new devices and new technologies as they emerge. ISN can take things as they come.

Linking multiple Packet Controllers lets you expand ISN to any size network. You can grow across one premise or across the country. And no matter how large your network gets, you choose the means of control—centralized or distributed. With ISN you're the boss.

You can bridge the communications gap.

What happens to your PBX? PC networks? Data processing systems? And all that hardware from Big Blue? ISN gets them all on speaking terms.

You can link ISN with the AT&T System 85 or AT&T System 75 PBXs. Whatever you have—data processing equipment and office



LETS YOU BE MASTER OF YOUR

automation equipment; isolated Ethernets,™ AT&T's STARLAN PC Network and 3B Net; smart and dumb—ISN gets it all working together. All sharing the same resources. With you in total control.

And what about those IBM 3270s? ISN makes them work even harder. Now your 3270 terminals can access multiple IBM hosts. And low-cost dumb terminals can do the same. Asynchronous and synchronous traffic can travel through your network with the same speed and efficiency.

You can handle heavy traffic.

ISN maintains a high end-to-end transmission speed of 8.64 mbps, and a high throughput rate even when traffic is at its peak.

Long messages or bursty transmissions—ISN's been engineered to handle it all. A unique centralized short bus and perfect scheduling access method permit messages to travel through the network almost instantaneously. And arrive with their integrity intact. So there's no waiting. No bottlenecks. No retransmitting data.

You've made the right connection.

AT&T has a long history of solving complicated networking problems with clear-cut, intelligent solutions. We know how to tie it all together.

And we know how to work with you. Our professional sales and service people are with you every step of the way—planning, designing and maintaining a network that will meet your business needs today and tomorrow.

ISN reflects AT&T's better approach to office automation. To learn why it's the right choice for your business, call your AT&T Information Systems Account Executive, or 1 800 247-1212.

COMTEN CONNECTIVITY.

MORE THAN 1,000 NETWORK USERS KNOW IT'S THE WAY TO MAKE THE MOST OF WHAT YOU'VE GOT.

How can you get the most from your computer network? Link systems together that fit business objectives? Merge new and old technologies such as SNA and non-SNA? And create a network where all the pieces communicate cost-effectively?

More than 1,000 network users have answered those questions with Connectivity from NCR Comten. It allows them to make the most of what they've got. And it can work for you, too.

Connectivity is a Comten data communications processing system—3600 or 5600 communications processor with SNA, X.25 and pre-SNA software—that gives you the option to select network hardware and software that fit your business plan. Without your plan being constrained by a single vendor or architecture. And Comten Connectivity extends the life and value of your system by allowing it to coexist with newer technologies. The bottom line is *your* bottom line. Comten Connectivity allows you to mix and match hosts and terminals with full system compatibility and minimal network disruption—cost-effectively.

For over 17 years, NCR Comten has helped a growing number of network users attain their data communications goals. Discover how our Connectivity experts can help you make the most of what you've got. Write for our free brochure to: "Data Communications," NCR Comten, Inc., Dept. 8015, 2700 Snelling Ave. No., St. Paul, MN 55113. Or call 1-800-334-2227. In Canada call 1-800-543-5713.
